Richard Lugar inspects an SS-18 ICBM being prepared for destruction under the Nunn–Lugar cooperative threat reduction program.

Lugar ran for the Republican nomination for President in 1996. He declared his candidacy on April 19, 1995 in Indianapolis. However, the announcement was largely overshadowed by the Oklahoma City bombing, an event that was the largest act of domestic terrorism on U.S. soil up to that time. The primaries and caucuses began in January 1996. He ran on a campaign slogan of "nuclear security and fiscal sanity", but his campaign failed to gain traction.[109]

He came in 7th in the Iowa caucuses on February 12 with 4%, and 4th in the New Hampshire primary on February 20 with 5%. In the Delaware primary on February 24 he also won 5%, and in the Arizona and North Dakota primaries on February 27 he came in last with 1%. He was on the ballot in seven of the nine contests on Super Tuesday on March 5, winning 1% in Colorado, Connecticut, and Maryland, 2% in Massachusetts, 3% in Maine and Rhode Island and 14% in Vermont, which was the best result he managed, though he still only came in 4th. He quit the race the next day, March 6. Lugar's fellow senator, and eventual Republican nominee, Bob Dole, had won all nine contests and Lugar endorsed him.[110]

Lugar's presidential campaign logo

He remained on the ballot in a number of states, winning 2% of the vote in Florida, then 1% each in Oregon, Illinois, Ohio, and California, 5% in Pennsylvania and 1% in North Carolina and West Virginia. He finished sixth overall, with 127,111 votes, or 0.83%, and failed to win any contests or delegates. In retrospective, David Corn of *Mother Jones* called his presidential campaign "ludicrous".[111]

Post-Senate career[edit]

On February 15, 2018, Lugar made a joint appearance with Lee H. Hamilton at DePauw University for the program "Can We Talk?: Restoring Civility in Public and Political Discourse in the U.S. and Abroad".[112]

The Lugar Center[edit]

Sen. Susan Collins at an event facilitated by The Lugar Center

Following his service in the Senate, Lugar established The Lugar Center, a nonprofit public policy institution located in Washington, DC.[113]

Under the leadership of Lugar, the Lugar Center seeks to become a prominent voice in many of the global issues that defined the Senator's work in Congress. There are four "focus areas": Global Food Security, WMD Nonproliferation, Foreign Aid Effectiveness, and Bipartisan Governance. Since its inception in January 2013, the Lugar Center has served as a source of education and awareness on these pertinent issues.

Logo of The Lugar Center

The Center's initiatives include the following: working in conjunction with the McCourt School of Public Policy at Georgetown University to establish the Bipartisan Index,[114] partnering with the Arms Control Association to establish the Bipartisan Nuclear and WMD Policy Dialogue Project, and compiling a comprehensive selection of bibliographical resources for researchers and policymakers interested in global food security. In addition, the Lugar Diplomacy Series brings together American policy- and opinion-makers and the Washington diplomatic community. Guests have included Elena Kagan, David Petraeus, and Howard Buffett.[115]

In addition, the Lugar Center was awarded a grant by the Delegation of the European Union to conduct policy research regarding transatlantic cooperation. The grant permitted the Center to partner with the German Marshall Fund of the United States to work on bolstering trans-Atlantic energy security and economic cooperation, particularly in relation to the Trans-Atlantic Trade and Investment Partnership.

Political positions[edit]

Abortion[edit]

Lugar's 2007 rating from NARAL was 40%.[116] His 2007–2008 rating from the National Right to Life Committee was 85%.[117]

Agricultural reform[edit]

As Chairman of the Agriculture Committee, Lugar built bipartisan support for 1996 federal farm program reforms, ending 1930s-era federal production controls. He worked to initiate a biofuels research program to help increase U.S. utilization of ethanol and combustion fuels, and led initiatives to streamline the U.S. Department of Agriculture, reform the food stamp program, and preserve the federal school lunch program.

A sample from the Lugar Bipartisan Index, compiled by the Lugar Center

Bipartisan governance[edit]

Although Republican, Lugar often worked across the aisle, working alongside Democrats on many initiatives. For this reason, he commonly broke with traditional Republican lines, especially on non-domestic issues. Lugar's most well-known piece of legislation, the Nunn–Lugar Cooperative Threat Reduction Agreement, was co-sponsored with Sam Nunn, a Democratic Senator from Georgia. Lugar's bipartisan efforts earned him 24th place of 227 Senators' lifetime scores from 1993–2014 according to the Lugar Bipartisan Index, with a score of .668.[118] Lugar continued to support bipartisan solutions and initiatives as one of the policy focus areas of The Lugar Center.[119]

Climate change[edit]

Lugar was a firm believer in pragmatic, scientific solutions to climate change issues. In 2006, he co-sponsored Senate Resolution 312 with then-Senator Joe Biden, which encouraged American participation in international negotiations regarding mitigation agreements.[120] Until his death, he continued to support multilateral initiatives for the deployment of innovative clean technology around the world.[121]

Cuba[edit]

Richard Lugar meeting with actress Ashley Judd

Lugar described U.S. sanctions on Cuba as a failed policy and wrote to President Obama that "additional measures are needed...to recast a policy that has not only failed to promote human rights and democracy, but also undermines our broader security and political interests".[122] He supported the Freedom to Travel to Cuba Act (S.428), which would lift the restrictions on U.S. citizens visiting Cuba in place since the early 1960s.[123]

Economy[edit]

Lugar took a conservative approach to economics. He voted for the Economic Growth and Tax Relief Reconciliation Act of 2001.[124] He voted against the American Recovery and Reinvestment Act of 2009.[125]

Gun control[edit]

Lugar was a supporter of gun control, and supported a number of gun legislations and weapons bans. He had an F rating from the National Rifle Association of America.[126] He had an F rating from Gun Owners of America and a 53% positive rating from the Brady Campaign to Prevent Handgun Violence.

Health care reform[edit]

Lugar opposed President Barack Obama's health reform legislation, voted against the Patient Protection and Affordable Care Act in December 2009,[127] and voted against the Health Care and Education Reconciliation Act of 2010.[128]

Immigration[edit]

Lugar had a generally liberal stance on immigration, supporting the DREAM Act during the Obama administration and the McCain–Kennedy Comprehensive Immigration Reform bill under the Bush administration, both of which died in Congress. Both were described by critics as "amnesty".

Iraq War[edit]

Richard Lugar and then-President Ronald Reagan, July 1981

On June 25, 2007, Lugar, who had been "a reliable vote for President Bush on the war", said that "Bush's Iraq strategy [is] not working and... the United States should downsize the military's role".[129]

Lugar's blunt assessment has been viewed as significant because it showed the growing impatience and dissatisfaction with President Bush's strategy in Iraq. After Lugar finished his remarks, Senate Majority Whip Richard Durbin (D-IL), a sharp critic of the war, praised Lugar's "thoughtful, sincere and honest" speech, which Durbin said was in the "finest tradition of the U.S. Senate".[130] Durbin urged his Senate colleagues to take a copy of Lugar's speech home over the Fourth of July break and study it before returning to work.[130] Senate Majority Leader Harry Reid said, in reaction to Lugar's speech: "When this war comes to an end, and it will come to an end, and the history books are written, and they will be written, I believe that Sen. Lugar's words yesterday could be remembered as a turning point in this intractable civil war in Iraq."[131]

Two days later, on June 27, 2007, Lugar said that Congressional measures aimed at curtailing U.S. military involvement in Iraq – including "so-called timetables, benchmarks" – have "no particular legal consequence", are "very partisan", and "will not work".[132]

Judicial nominees[edit]

Senators Sam Nunn and Lugar leaving the White House in 1991 after briefing President George H. W. Bush on the Nunn–Lugar legislation

Lugar believed that judicial confirmation decisions should not be purely partisan. His view was if an appointee is properly qualified for the position by their education, integrity, and other similar factors, that they should be confirmed by the Senate. Lugar introduced President George W. Bush's appointee, now Chief Justice John Roberts, to the Senate at the beginning of Roberts's confirmation process and was instrumental in securing votes to confirm Roberts for the Supreme Court. Lugar was among the few Republican Senators to support President Barack Obama's first Supreme Court nominee United States Circuit Court of Appeals, Judge Sonia Sotomayor,[133] and also voted in favor of his second Supreme Court nominee, Solicitor General Elena Kagan.[134]

LGBT issues[edit]

Lugar held a socially conservative approach on LGBT issues. He voted for the Federal Marriage Amendment, limiting the definition of marriage to one man and one woman.[135] However, he has also voted in favor of the Matthew Shepard Act, which expanded the federal hate crime statutes to include sexual

and one woman.[135] However, he has also voted in favor of the Matthew Shepard Act, which expanded the federal hate crime statutes to include sexual orientation and gender identity.[136] In October 2010, Lugar voted against repeal of the Don't Ask, Don't Tell policy—which prevented gays and lesbians from serving openly in the armed forces.[137] Although Senator Joe Lieberman of Connecticut announced on November 18, 2010, that Lugar promised to vote to repeal the policy the next time it comes up for a vote,[138] Lugar voted against DADT repeal in both the cloture[139] and final votes on December 18, 2010.[140]

Middle East[edit]

In a television interview on September 11, 1983, amid President Reagan not defining the penalties for American casualties in the Middle East, Lugar stated the US position in Lebanon was "clearly defensive" but concurred that issue was debatable.[141]

On May 6, 1986, Lugar was among 22 senators to vote in favor of the Reagan administration-backed proposed arms sale to Saudi Arabia, warning other senators prior to voting that they "were taking a headlong plunge in opposition to the President of the United States".[142] Lugar and fellow Senator Bob Dole, both of whom supported the arms sale proposal, stated that President Reagan would be crippled in his role in the Middle East peace settlement in the event that he was unable to deliver a reduced arms package to the moderate Arab state.[143]

On August 7, 2012, Lugar called for the United States and Russia to work in collaboration to eliminate the stockpile of chemical weapons in Syria during an interview. He noted that the proposal had been turned down by Russian officials, who noted Syria had not previously supported the Chemical Weapons Convention, and that other countries saw the stockpile of Syrian weapons as "influencing very adversely the potential for peace and stability in the Middle East".[144]

Nuclear stockpile[edit]

Lugar was influential in gaining Senate ratification of treaties to reduce the world's use, production and stockpiling of nuclear, chemical, and biological weapons, and spearheaded many bipartisan nonproliferation initiatives. In 1991 he initiated a partnership with then-Senate Armed Services Committee Chairman Sam Nunn aiming to eliminate latent weapons of mass destruction in the former Soviet Union.[3] To date[*when?*], the Nunn–Lugar Cooperative Threat Reduction program has deactivated more than 7,500 nuclear warheads. In 2004, Lugar and Nunn were jointly awarded the Heinz Awards Chairman's Medal for their efforts.[145] He was an integral figure in the passing of the New START Treaty (which passed 71–26).[146]

Pakistan[edit]

In October 2008, Lugar and Joe Biden, his partner in the Committee on Foreign Relations, received the Hilal-i-Pakistan (Crescent of Pakistan) Award from the government of Pakistan for their continued support of the country. In July 2008 Lugar and Biden introduced a plan that would give $1.5 billion in aid per year to support economic development in Pakistan.[147]

Other international policy achievements[edit]

Senator Lugar supported Nelson Mandela's fight against South African apartheid. When President Reagan vetoed economic sanctions against South African leaders as a punitive measure for apartheid, Lugar turned against his own party and led the charge to overrule the veto successfully with bipartisan support. As Chair of the Senate Foreign Relations Committee, he declared on the Senate floor, "We are against tyranny, and there is tyranny in South Africa."[148]

Lugar was also instrumental to the fall of the dictatorial Marcos regime in the Philippines and overseeing the 1985 presidential election there, urging intervention from the Reagan administration.[149][150]

In addition, Lugar coauthored the Cardin–Lugar Amendment to the Dodd–Frank Act, which required all U.S.-listed oil and mining companies to report their payments to governments. Nearly identical pro-transparency measures, aimed at curbing natural resource-related corruption in the developing world, were subsequently adopted by the European Union and Canada, making extractive industry payment disclosure a global standard.[151]

Views on Trump administration[edit]

In a November 2017 interview, Lugar stated that President Donald Trump had not "demonstrated civility in his leadership" and that his usage of Twitter and "other bombastic avenues" were not solving issues.[152]

Awards and honors[edit]

Lugar, left, Secretary of Defense Leon E. Panetta, center, and former Georgia Sen. Sam Nunn receive recognition for their bipartisan work regarding nuclear nonproliferation, December 2012

Lugar received numerous awards, including Guardian of Small Business, the Spirit of Enterprise, Watchdog of the Treasury, and 46 honorary doctorate degrees.[155] In 2001, Lugar received the Democracy Service Medal of the National Endowment for Democracy.[156] In 2010, Lugar received the Benjamin Harrison Presidential Site Advancing American Democracy Award. In June 2012, he was conferred with the Grand Collar of the Order of Lakandula by President Benigno S. Aquino III for his contributions to the enhancement of the Philippine-US alliance and friendship[157] as well as Poland's Knight of Freedom Award for his actions and support of the Polish accession process to NATO structures.[158]

On August 8, 2013, President Barack Obama named Lugar as a recipient of the Presidential Medal of Freedom. The citation in the press release read as follows:

"Richard Lugar represented Indiana in the United States Senate for more than 30 years. An internationally respected statesman, he is best known for his bipartisan leadership and decades-long commitment to reducing the threat of nuclear weapons. Prior to serving in Congress, Lugar was a Rhodes Scholar and Mayor of Indianapolis from 1968 to 1975. He currently serves as President of the Lugar Center."[159]

Lugar was knighted as a Knight Commander of the Order of the British Empire (KBE) for his efforts to reduce Weapons of Mass Destruction and supporting NATO.[160] Lugar was awarded the Grand Cross of the Order of Merit, from Germany, in 2013, for his work on fostering transatlantic cooperation.[161] In 2014, Lugar received the Golden Laurel Branch award, the highest honor given by the Bulgarian Ministry of Foreign Affairs. Lugar was recognized for his contributions to Bulgaria's accession to NATO.[162]

In August 2016, President Petro Poroshenko of Ukraine awarded Richard Lugar with the highest award for foreigners — Order of Liberty.[163] In November 2016 he was awarded the 2016 J. William Fulbright Prize for International Understanding.[164] In 2005, Lugar was presented the Lifetime Contributions to American Diplomacy Award by the American Foreign Service Association.[165]

Other outside activities[edit]

Lugar was a member the Indiana Society of the Sons of the American Revolution,[166] as well as a member of the Society of Indiana Pioneers, based on his descent from very early settlers in the state.[167] He joined the Rotary Club of Indianapolis in 1957 and spoke at the club annually during his time in the U.S. Senate. He remained an active Rotarian.[168][169] On February 16, 2013, Lugar was named the Rotarian of the Century.[170] He served on the Board of Directors of the National Endowment for Democracy from 1992 to 2001.[171]

Lugar was a member of the board of the International Foundation for Electoral Systems, an organization involved in international elections.[172] He was a member of the board of the Nuclear Threat Initiative (NTI).[173] Lugar was on the Board of Selectors of the Jefferson Awards for Public Service.[174]

Richard G. Lugar Center for Public Health Research[edit]

A biological research facility in Tbilisi, Georgia, is named after Lugar in honor of his efforts to reduce nuclear, chemical, and biological weapons around the world. The Richard G. Lugar Center for Public Health Research is a biological research facility funded by the U.S. Defense Threat Reduction Agency (DTRA)

world. The Richard G. Lugar Center for Public Health Research is a biological research facility funded by the U.S. Defense Threat Reduction Agency (DTRA)[175] to contain and house dangerous pathogens and support international research efforts. It and other upgraded bio-threat reduction facilities in the region are designed to stop diseases like plague and African swine fever from spreading globally.[176][177]

Lugar, utilizing the Nunn–Lugar Cooperative Threat Reduction Program (CTR) which helped former Soviet Union states dismantle weapons of mass destruction after the Cold War, worked with the country of Georgia on biosafety, biosecurity and biosurveillance efforts through CTR's Cooperative Biological Engagement Program (CBEP). The main goal was to improve the biosafety, biosecurity, disease surveillance, and establish the Central Public Health Reference Laboratory.[178]

In 2012, Georgian authorities renamed the facility the Richard G. Lugar Center for Public Health Research; it belongs to and is run by the Georgian National Center for Disease Control and Public Health (NCDC). In 2014, then-U.S. Ambassador to Georgia at the time, Richard Norland, signed an agreement with then-Georgian Prime Minister Irakli Garibashvili to transfer custody of the Center to the NCDC during the 2014 World Congress on Chemical, Biological, Radiological and Nuclear Science & Consequence Management. At the invitation of the Georgian government, a contingent of U.S. scientists from the U.S. Centers for Disease Control and Prevention (CDC) Global Disease Detection Program, and the U.S. Walter Reed Army Institute of Research are co-located in the facility. They work collaboratively alongside their Georgian counterparts.[179][180][181]

Personal life and death[edit]

Lugar married Charlene Smeltzer on September 8, 1956. The couple had four sons.[5] He was a member of the United Methodist Church.[182]

Lugar died in Falls Church, Virginia, on April 28, 2019, shortly after his 87th birthday, from complications of chronic inflammatory demyelinating polyneuropathy.[183][184] He was buried in Arlington National Cemetery.[185]

Legacy[edit]

John T. Shaw assessed the Nunn–Lugar Cooperative Threat Reduction as Lugar's landmark legislative accomplishment.[186] The initiative would later be considered "one of the most prescient pieces of legislation ever passed, and the most important nonproliferation program ever".[187]

In 2000, Eric Schmitt described Lugar as "a four-term senator, former presidential candidate and perhaps the most popular politician in Indiana history".[188] Following Lugar's 2012 Senate loss, Peter Rusthoven stated, "Historically, this is not just one of the great senators now. This is one of the great senators in United States history. He is like a Daniel Webster, he is like a Henry Clay—names that I fear too many of our kids in grade school and high school don't even know anymore."[189]

Lugar's defeat in the 2012 Senate Republican primary was written of as a sign of the national GOP base's escalation into strict support for the traditional views aligned with the right.[190] Former Senator John Danforth said the loss told him "that there is an attempt by a lot of people to purge the Republican Party and to kick out of it people who do not hue a very strict party line".[191] Geoffrey Kabaservice cast doubts on this view: "It may be that his bipartisanship and comparative moderation contributed to his loss, or his defeat may simply have reflected the political truism that young blood drives out the old. What's certain is that the Senate will miss his qualities, and in time so may we all."[192]

Lumen Technologies, Incorporated

Wikipedia Lumen Technologies

NOTE - As of Sep 2020, **CenturyLink, Incorporated** has been renamed to be **Lumen Technologies, Incorporated** . This page will keep company starting around this rebranding, and for the time after this name change.

Saved Wikipedia (Dec 17, 2020) - Lumen Technologies

[HK0044][GDrive]

Lumen Technologies (formerly [**CenturyLink, Incorporated**]) is an American telecommunications company headquartered in Monroe, Louisiana, that offers communications, network services, security, cloud solutions, voice, and managed services. The company is a member of the S&P 500 index and the Fortune 500.[5] Its communications services include local and long-distance voice, broadband, Multi-Protocol Label Switching (MPLS), private line (including special access), Ethernet, hosting (including cloud hosting and managed hosting), data integration, video, network, public access, Voice over Internet Protocol (VoIP), information technology, and other ancillary services.[6] Lumen also serves global enterprise customers across North America, Latin America, EMEA (Europe, Middle East, and Africa), and Asia Pacific.[7]

History

The earliest predecessor of Lumen was the Oak Ridge Telephone Company in Oak Ridge, Louisiana, which was owned by F. E. Hogan, Sr. In 1930, Hogan sold the company, with 75 paid subscribers, to William Clarke and Marie Williams, for $500. They moved the switchboard to the Williams family front parlor. In 1946, the Williams' son, Clarke McRae Williams, received ownership of the family's telephone company as a wedding gift.[8] In 1947, Clarke Williams learned the telephone company in Marion, Louisiana was for sale. With a loan from business associate Joe Sydney Carter, Clarke purchased the Marion Telephone Company and eventually made it his base of operation as he grew his company through more acquisitions. Lumen still maintains offices in the former headquarters building.[9] The company remained as a family-operated business until it became incorporated in 1968.

- **1967–1999 :** [See **CenturyLink, Incorporated**]
- **2020 name change to Lumen :** On September 14, 2020, CenturyLink, Inc announced they have rebranded to Lumen Technologies, Inc.[65] Effective with the opening of the trading day on Sept. 18, 2020, the company stock ticker changed from CTL to LUMN. For residents and small businesses, the CenturyLink brand will continue to be used for traditional copper-based services. *Quantum Fiber* branding will be used for fiber-based products and services.[66]

Products and services

Lumen's products and services focus on three segments: Enterprise Business, Small Business, and Residential.[67]

Lumen Enterprise Business[edit]

Lumen Enterprise Business provides products and services around Network, Cloud, Security, Voice, and Managed Services to enterprise customers.[68] Lumen's Network services include SD WAN, MPLS/IPVPN, Hybrid WAN, Ethernet, Internet Access, Wavelength services, Dark Fiber, and Private Lines.[69] Lumen Cloud provides Big Data as a Service, Internet of Things (IoT), Multi-Cloud Management, Private Cloud, Public Cloud, Bare Metal, SaaS Applications, and Cloud Connect.[70] Lumen Security monitors more than a billion security events daily.[71]Services include: Cloud, Infrastructure, DDoS, Web Application, Email, and Web Security. The company also provides Analytics and Threat Management, Risk and Compliance support, and Threat Research Labs.[72] CenturyLink offers voice products ranging from traditional landlines to Unified Communications and Collaboration (UC&C) services and was recognized in 2018 by Frost & Sullivan for "growth excellence in VoIP access and SIP Trunking".[73] Lumen's Managed Services include Advanced Professional Services, IT consulting, and strategic partnerships.[74]

CenturyLink Small Business[edit]

CenturyLink Small Business provides products and services around Internet, Phone, TV, and Cloud Applications.[74]

CenturyLink Residential[edit]

CenturyLink Residential[edit]

CenturyLink Residential provides Internet (including Gigabit Fiber), Voice, and TV, via partnership with DirecTV.[75] The company also offers bundling with Verizon Wireless.[76]

Availability by state[edit]

CenturyLink Availability Map by Zip Code

CenturyLink residential services are available in the following states:[77]

- Alabama
- Arizona
- Arkansas
- Colorado
- Florida
- Georgia
- Idaho

- North Dakota
- Ohio
- Oklahoma
- Oregon
- Pennsylvania
- South Carolina
- South Dakota
- Tennessee
- Texas
- Utah
- Virginia
- Washington
- Wisconsin
- Wyoming

Fiber[edit]

Quantum Fiber is a fiber to the premises service in the United States, providing broadband Internet to a small and very slowly growing number of locations. The service was first introduced to Omaha, Nebraska,[78] and next rolled out to Las Vegas, Nevada,[79] with plans for expansion to several other markets.[80] Unlike the company's existing high speed Internet deployments, which utilize fiber-to the node/neighborhood to increase the speed of ADSL2+ speeds up to 20/2 Mbit/s, Vectored VDSL2+ speeds up to 140/10Mbit/s, in these markets CenturyLink now installs their fiber optic cable all the way to the home or business with speeds up to 1,000 Mbit/s download and 1,000 Mbit/s upload[81] using Calix Optical Network Terminals.[82] On Feb. 2, 2014, CenturyLink announced the availability of Gigabit fiber service to multi-tenant businesses in Salt Lake City and surrounding communities.[83] On Aug. 5, 2014, CenturyLink announced the expansion of its gigabit fiber service to 16 additional markets.[84] On September 15, 2015, CenturyLink announced the expansion of its gigabit fiber service to residential and business customers in six additional states, increasing the company's service coverage to select areas of 17 states.[85]

Data centers[edit]

On May 2, 2017 CenturyLink, Inc. completed the previously announced sale of its data centers and colocation business to funds advised by BC Partners, in a consortium including Medina Capital Advisors and Longview Asset Management. The deal was worth approximately $1.86 billion with CenturyLink retaining an approximately 10% equity stake in the consortium's newly formed global secure infrastructure company, Cyxtera Technologies.[67]

Organizational structure [as of Dec 17, 2020]

CenturyLink is the second largest U.S. communications provider to global enterprise customers. CenturyLink has customers in more than 60 countries.[93]

- Jeff Storey[94] - Chief Executive Officer
- Shaun Andrews[95] - Executive Vice President, Product Management and Chief Marketing Officer
- Richard Batelaan[96] - Executive Vice President, North American Operations
- Neel Dev[97] - Executive Vice President and CFO
- Andrew Dugan[98] - Chief Technology Officer
- Stacey W. Goff[99] - Executive Vice President, General Counsel and Chief Administrative Officer
- Fletcher Keister[100] - Chief Transformation Officer
- Edward Morche[101] - President, Strategic Enterprise and Government Markets
- Maxine L. Moreau[102] - President, Consumer Markets
- Laurinda Pang[103] - President, International and Global Accounts Management
- Scott A. Trezise[104] - Executive Vice President, Human Resources

Naming rights and sponsorships

Venue naming rights[edit]

Current[edit]

- Lumen Field – Seattle, Washington (formerly *Seahawks Stadium*, *Qwest Field*, and *CenturyLink Field*)

Former[edit]

- CenturyLink Arena Boise – Boise, Idaho (now *Idaho Central Arena*, formerly *Bank of America Centre* and *Qwest Arena*)
- CenturyLink Center – Bossier City, Louisiana (now *Brookshire Grocery Arena*, formerly *Bossier City Arena* and *CenturyTel Center*)
- CenturyLink Center Omaha – Omaha, Nebraska (now *CHI Health Center Omaha*, formerly *Qwest Center Omaha*)

Sponsorships[edit]

- Denver Broncos[105]
- Orlando Magic[105]
- Idaho Steelheads[105]
- Seattle Seahawks[105]
- Texas Rangers
- Tampa Bay Buccaneers
- Minnesota Vikings[105]
- Portland Trail Blazers[105]
- ULM[105]
- LA Tech

Criticism and controversy

The Federal Communications Commission ordered CenturyLink to pay a record $16 million for failing to alert authorities of a preventable programming error that left nearly 11 million people in seven states without access to emergency services for six hours in 2014.[106][107]

In December 2018, CenturyLink faced criticism for requiring residential customers in Utah to, via DNS hijacking, view and acknowledge a notice advertising its security and parental control software, before they could connect to the internet again. The provider claimed that this was required by a recently enacted state law, which requires all ISPs to inform users that they provide "the ability to block material harmful to minors". Bill sponsor and Utah State Senate member Todd Weiler stated that the law did not require that service be disrupted until the notice is acknowledged; the law only requires that this notice be delivered in a "conspicuous" manner (such as an advertisement within a bill or invoice) and does not require disruption of service.[108]

On December 27, 2018, a “nationwide outage” caused 9-1-1 service to be disrupted across the country. The Federal Communications Commission says it will investigate.[109][110] In some areas the outage lasted nearly twelve hours and was the third shutdown of the year following outages in April and November 2018. ATM and point of sale credit card machines were also widely affected.[111]

On August 30, 2020, CenturyLink suffered a major technical outage due to misconfiguration in one of the company's data centers. The outage impacted tech giants such as Cloudflare, Amazon, Twitter, Xbox Live and many more. Reports indicate that all services were restored by 11:12 am ET.[112][113]

Warren Grant "Maggie" Magnuson (April 12, 1905 – May 20, 1989) was an American lawyer and politician. A member of the Democratic Party, he served as a U.S. Representative (1937–1944) and a U.S. Senator (1944–1981) from Washington. He served over 36 years in the Senate, and was its most senior member during his final two years in office.

Early life and education[edit]

Warren Magnuson was born in Moorhead, Minnesota.[3] His birthdate is supposedly April 12, 1905, but the actual records of his birth are sealed.[4] According to various sources, he never knew his birth parents; they may have died within a month of his birth,[5] or his unmarried mother put him up for adoption.[6] William Grant and Emma (née Anderson) Magnuson adopted Warren, who gave him their name.[7] The Magnusons were second-generation Scandinavian immigrants who operated a bar in Moorhead, and adopted a daughter, Clara, a year after adopting Warren.[8] His adoptive father left the family in 1921.[4]

Magnuson attended Moorhead High School, where he played quarterback on the football team and was captain of the baseball team.[6] While in high school, he ran a YMCA camp, worked on wheat farms, and delivered newspapers and telegrams in Moorhead and nearby Fargo, North Dakota.[7] He graduated in 1923, and then enrolled at the University of North Dakota in Grand Forks.[3] In 1924, he transferred to the North Dakota Agricultural College in Fargo, which he attended for a year.[6] He then traveled through Canada for some time, riding freight trains and working with threshing crews.[7]

Magnuson followed a high school girlfriend to Seattle, Washington, where he entered the University of Washington in 1925.[8] He was a member of Theta Chi fraternity, and worked delivering ice as a Teamsters member under Dave Beck.[4] He received a Bachelor of Arts degree in 1926, and earned a Bachelor of Laws degree from the University of Washington School of Law in 1929.[3] A Democrat, he first became active in politics in 1928, volunteering for A. Scott Bullitt for governor and Al Smith for president.[6]

Early career[edit]

In 1929, Magnuson was admitted to the bar and joined the law office of Judge Samuel Stern in Seattle.[6] He served as secretary of the Seattle Municipal League from 1930 to 1931[3] and served as a special prosecutor for King County in 1932, investigating official misconduct.[5] He founded the state chapter of the Young Democrats of America that same year.[9] He was a leading supporter of repealing state Prohibition laws and establishing the state Liquor Control Board.[10]

From 1933 to 1935, Magnuson served as a member of the Washington House of Representatives from the Seattle-based 37th Legislative District.[10] As a state legislator, he sponsored the first unemployment compensation bill in the nation.[7] Magnuson was a delegate to the state constitutional convention in 1933.[3] He briefly served as Assistant United States District Attorney before being elected prosecuting attorney of King County, serving from 1934 to 1936.[7]

Congressional career[edit]

Magnuson was first elected to the House of Representatives in 1936, filling a vacancy caused by the sudden death of fellow Democrat Marion Zioncheck on August 7, 1936. In 1937, along with senators Homer Bone and Matthew Neely, Magnuson introduced the National Cancer Institute Act, signed into law by Franklin Roosevelt on August 5 of that year.[11] He was reelected in 1938, 1940, and 1942. After the Attack on Pearl Harbor, Magnuson was a staunch supporter of the U.S. war effort.[12]

Magnuson served in the United States Navy during World War II. He was aboard the aircraft carrier USS *Enterprise* for several months, seeing heavy combat in the Pacific Theatre until Roosevelt ordered all congressmen on active duty to return home in 1942.

In 1944, Magnuson successfully ran for the U.S. Senate. On December 14, 1944, Governor Arthur B. Langlie appointed Magnuson to fill the vacancy created by Homer Bone's appointment to the Ninth Circuit Court of Appeals, thus resigning from the House and starting his Senate tenure a month early.

Magnuson was reelected in 1950, 1956, 1962, 1968, and 1974. He served on the Senate Commerce Committee throughout his tenure in the Senate, and the Senate Appropriations Committee during his final term. Magnuson served most of his tenure in the Senate alongside his friend and Democratic colleague from Washington State, Henry M. "Scoop" Jackson. State Attorney General Slade Gorton defeated Magnuson in the 1980 election.

In August 1950, Magnuson proposed voluntary enlistment for the Japanese in the American armed forces and sent a cable request to General Douglas MacArthur on the practicality of the proposal.[13]

In November 1961, President John F. Kennedy visited Seattle and was an honored guest at a celebration honoring Magnuson's first 25 years in Congress.[14] [15] Nearly 3,000 people paid $100 each to attend the dinner.

At the end of August 1966, after President Lyndon Johnson announced the nominations of Charles F. Luce for Undersecretary of the Interior, John A. Carver for Federal Power Commission membership, and David S. Black for BPA administrator, Magnuson announced the Senate Commerce committee would hold hearings on Carver's nomination on September 1. He called Luce "one of the most able, dedicated, productive public servants I know."[16]

On November 7, 1967, Johnson signed the Public Broadcasting Act of 1967, citing Magnuson as one of the members of Congress to "have been part of the team that has brought this measure to the White House to make it the law of our land."[17]

At least three important pieces of legislation bear his name: the Magnuson-Stevens Fishery Conservation and Management Act, the Chinese Exclusion Repeal Act of 1943 (commonly referred to as the Magnuson Act), and the Magnuson-Moss Warranty Act. He was also instrumental in keeping supertankers out of Puget Sound, by slipping through an amendment to a routine funding reauthorization bill on the Senate and House consent calendars.[18]

The bill that became the Civil Rights Act of 1964 was referred to the Committee on Commerce. Magnuson played a key role in getting it to the floor and enacted into law despite vigorous opposition by Senator William Fulbright and other staunch segregationists.

Magnuson was responsible for special legislation that allowed Poon Lim, a Chinese sailor who in 1942 survived 133 days alone at sea as a castaway, to immigrate to the U.S.

Magnuson attended the May 5, 1978, dedication ceremony for Riverfront Park in Spokane.[19] Shortly after that, during a town hall meeting, President Jimmy Carter said, "No one could be in a better political position than to be preceded and introduced by men like Tom Foley and Senator Warren Magnuson. I know of no one in the Congress than these two men who are more respected, more dedicated to serving their own people well, but who have also reached, because of their experience and knowledge, sound judgment and commitment, a position of national and even international renown and leadership."[20]

Personal life[edit]

In 1928, Magnuson married Eleanor Peggy "Peggins" Maddieux, crowned Miss Seattle the previous year.[6] They remained together until their divorce in 1935.[10] Magnuson dated several glamorous women, including heiress and cover girl June Millarde and actress Carole Parker.[4] In 1964, he married Jermaine Elliott Peralta (1923–2011), widowed as a teenager, in a ceremony conducted by Rev. Frederick Brown Harris at the Omni Shoreham Hotel.[10] The couple remained together until his death, and he helped raise Peralta's daughter from her previous marriage, Juanita.[5] Magnuson and his wife are interred in Acacia Memorial Park in Lake Forest Park, north of Seattle.[21]

Namesakes[edit]

- Warren G. Magnuson Health Sciences Building at the University of Washington's Health Sciences building complex was named in his honor in 1970.
- Warren Magnuson's Senate desk is located in an alcove in the Suzzallo Library graduate reading room at the University of Washington.
- Warren G. Magnuson Clinical Center at the National Institutes of Health in Bethesda, Maryland is also named for Senator Warren Magnuson.
- Warren G. Magnuson Park in northeast Seattle was named in his honor in 1977.
- Warren G. Magnuson Puget Sound Legacy Award has been established by the People For Puget Sound
- The Washington State Democratic Party[22] holds an annual Magnuson awards dinner (sometimes referred to as the Maggies, per his nickname).
- The Intercollegiate College of Nursing building in Spokane on Fort George Wright Drive near Spokane Falls Community College is named after him.

Born in 1905 and adopted by a Swedish family in Moorehead, Minnesota, Warren Magnuson moved to Seattle to attend the University of Washington. He began practicing law soon after he graduated from the University of Washington Law School in 1929. His early positions included Executive Secretary of the Seattle Municipal League, Special Prosecuting Attorney for King County, Assistant U.S. District Attorney and attorney to the Washington Emergency Relief Administration. Magnuson, a Democrat, began his political career in the Washington State House of Representatives during the 1933 legislative session. In 1934 he was elected King County Prosecuting Attorney, an office he held until his election to the U.S. House of Representatives from the First District in 1936. During his tenure in the House, Congressman Magnuson served on the Naval Affairs Committee and the Alaska International Highway Commission. A naval reservist before World War II, Magnuson spent several months on active duty in 1942.

In 1944 Magnuson was a successful candidate, for the Senate. **He assumed his Senate seat early when his predecessor, Homer T. Bone, resigned shortly before the end of his term, thereby giving Magnuson seniority over other newly elected Senators.**

Warren Magnuson was best known throughout his long Congressional career for his championship of consumer and health legislation. Appointed to the Commerce Committee in 1945, he became chair of that committee in 1955 after the Democrats took control of the Senate. Consumer protection legislation was an important part of the Commerce Committee's agenda throughout Magnuson's 23 years as chairman. In 1966 a separate Consumer Subcommittee was created and Magnuson served as its chairman also. His accomplishments were recognized by the National Consumer's League when, in 1977, they presented Magnuson with their Trumpeter Award for outstanding achievements in consumer protection. Magnuson co-authored a 1968 book, *The Dark Side of the Market Place* whichattempted to raise public awareness of the need for consumer safeguards.

Magnuson was also an advocate of government support for scientific research in the years following World War II. In 1945 he introduced a bill which, when finally signed into law in 1950, created the National Science Foundation. As a freshman Congressman Magnuson sponsored legislation in the House which created the country's first tax-supported research center, The National Cancer Institute. This bill marked the beginning of a career-long dedication to governmental support of biomedical research and education, which he continued through his 1948 sponsorship of a bill to create the National Institutes of Health, and expanded in the 91st Congress, when he assumed the chairmanship of the Appropriations subcommittee responsible for funding health, labor and education programs. In 1973 Magnuson was the recipient of the Albert Lasker Public Service in Health award.

A member of the Appropriations Committee since 1945, Magnuson assumed its chairmanship in 1978 and resigned as chair of the Commerce Committee. In 1979 he was elected President Pro Tempore of the Senate, reflecting his status as most senior member of the Senate.

Other issues which concerned Magnuson throughout his career were civil rights, particularly through his authorship of the public accommodations section of the 1964 civil rights act; environmental protection, including ports and waterways safety and supertanker regulation; and improvement of public power and irrigation systems in the Northwest.

The Boston Globe (Boston, Massachusetts) · 19 May 1946, Sun

Miss Mann Is Bride

Miss Shirley Mann, daughter of Mr. and Mrs. Harold Mann, 37 Kimball road, Arlington, became the bride yesterday afternoon of Charles R. Clough Jr., son of Mr. and Mrs. Charles R. Clough of Somerville.

The 4 o'clock ceremony was performed at the Orthodox Congregational Church by Rev. David G. Colwell, the minister, assisted by Rev. W. D. Clough of New York, uncle of the groom.

Mrs. Robert L. Mann of Cambridge, sister-in-law of the bride, was matron of honor. The flower girl was Kristin Albertson, Melrose, cousin of the groom. The bridesmaids were Mrs. Charles C. Bond, Arlington; Miss Elizabeth Merrill, Arlington; Miss Elsie Pease, Merrimac Port, and Miss Virginia Given, Arlington. Ralph Creeden of Boston was best man. The ushers included Harry E. Wood, Medford; Lt Com Robert L. Mann, Cambridge, brother of the bride; Andrew Mader of Merrimac Port, and James Russell Jr., Somerville, cousin of the groom.

Following the ceremony, a reception was held. After a wedding trip to New Hampshire and Chicago, Mr. and Mrs. Clough Jr. will make their home in Chicago after June 1. The bride is a graduate of Chandler Secretarial School, and the groom is a veteran of World War II.

The Boston Globe (Boston, Massachusetts) · 09 Nov 1953,

33 Employees Win Awards at Arsenal

Thirty-three Civil Service employees, both active and retired, have received awards for long service at the Watertown Arsenal.

Longest record for years of service in the group went to James H. Coughlin of East Cottage st., Dorchester, and William C. Newcomb of Park drive, Back Bay, both with more than 39 years of service.

James J. Fay of Schofield drive, Newtonville, was honored for his record of more than 38 years of service. Harold C. Mann of Kimball road, Arlington, had more than 37 years of employment.

Others honored were:

Julia Siamin, Natick; Ernest L. Earle, Watertown; Henry Geddry, Cambridge; Louis P. Ray, Franklin; Stephen E. Connor, Watertown; Alexander Shields, Belmont; Mark K. Donnelly, Mattapan; Mary F. Diggins, Brighton; Marguerite Gould, Brighton; Nona W. Fay, Newtonville; Fred L. Brackley, Newton; Catherine L. Keefe, Cambridge; Allan Sloan, Watertown; Lorenzo Shepard, Auburndale; Patrick Hughes, Newton; John W. Sherman, Weston; Harold G. Carter, West Newton; Horace H. Lester, Cambridge.

Retired employees are: Agnes Morley, Newtonville; Isador Pearson, Belmont; Clarence Badger, Hudson; Sidney E. Beck, Watertown; Alice Fitzgerald, Brighton; Alec Magnuson, Melrose; Oscar Houghton, Waltham; John A. Moorehead, Belmont; Ray Williams, Brighton; Robert T. Lorrey, South Lincoln, and John Dignin, Brighton.

1934 - Donald Mann (boy) in Arlington, as a boy scout, rescues a cat ?

Full page : [HN00Q8][GDrive]

The Boston Globe (Boston, Massachusetts) · 10 Nov 1934, Sat · Page 5

LONG-LOST KITTEN BACK WITH FRIENDS

Arlington Boy Scout Makes Family Happy

It was his good deed for the day. The act not only marked his sense of duty as a good Boy Scout, but revealed his thoughtfulness and a love for dumb animals. Happiness resulted for all concerned.

A few weeks ago a handsome black-and-white kitten arrived from a country town at its new home on Kimball road, Arlington. The three youngsters of the household named him Blackie and in no time a Damon and Pythias comradeship grew between the junior cat and Bill Jr of the family.

For everybody, everything was new. One day Blackie slipped out only to be sent scrambling up a telegraph pole by a vociferous, but playful, puppy. Finally, the owner, with the aid of a delivery boy, rescued the kitten. As kittens will do, Blackie got into further trouble by disappearing a few days later. A widespread search was made without result.

Next door lives Donald Mann, a tenderfoot member of Troop 8, Boy Scouts, of Arlington. He heard about Blackie's climb and his later disappearance.

Out on his bicycle one rainy afternoon delivering magazines to his customers he saw a small cat that seemed bewildered. It looked familiar, a good deal like the missing Blackie. He called it by name and his hunch was right. It was the missing kitten.

Without much ado, Donald picked him up, stroked him tenderly, tucked the kitten under his arm, and Blackie rode home "on rubber" and was greeted with manifestations of great joy by his two youthful mistresses and boy pal.

Recommendation has been made to the merit badge committee of Donald's troop that he be commended for his thoughtfulness.

The Boston Globe (Boston, Massachusetts) · 13 Feb 1944, Sun · Page 7

Tufts College to Name 163 as Degree Candidates Today

MEDFORD, Feb. 12—One hundred and sixty-three civilian students, who complete their streamlined courses at Tufts College by Feb. 19, will be named as degree candidates tomorrow afternoon at 3 o'clock by Dr. Leonard Carmichael, president of Tufts.

Dean Howard Mumford Jones of the Harvard Graduate School of Arts and Sciences will give the convocation address, "Attractions of Stupidity." The names of 300 .-12 students completing their naval training courses and 59 NROTC students leaving at the end of the present term will also be read.

Among engineering candidates will be Miss Charlotte C. Taylor of Upper Montclair, N. J., the first co-ed ever to be graduated from the school. She will be awarded a degree of B. S. in chemical engineering

A complete list of degree candidates includes:

SCHOOL OF LIBERAL ARTS

Bachelor of Arts

Robert H. Achin, Robert M. Blaisdell, Albert D'Orland, Harold M. Drake Jr., Harry F. Eaton Jr., Carmon M. Elliott Jr., Edward E. Harriman, George F. Jackson, Allyn F. Judd, Michael J. Kenny, Haig J. Nargesian, John P. Robertson, Robert I. Shohet, Ernest A. Thorsell, Friedrich J. von Mering.

Bachelor of Science

Theodore M. Behrman, Preston S. Billings, Harold J. Bornhold, Ralph A. Crusius, Anthony R. Gabriel, Andrew W. Gibbons, Thomas M. Gilroy, Julius Mark, Robert R. Nardone, Constantine Photos, Frederick M. Piecewicz, Anthony J. Pierangelo, Ralph S. Sawyer, Henry F. Snell, Sherman L. Waldron.

Bachelor of Science in Chemistry

Hubert R. Irvine, Hurire Kooshoian, August May Jr., John H. Mengel, Frank G. Nickerson, Morrs Stone, Richard E. Weymouth, Antonio Zullo.

JACKSON COLLEGE FOR WOMEN

Bachelor of Arts

Constance Arnold, Virginia L. Atwater, Barbara Baker, Pauline I. Beaupre, Loreto Besa, Barbara H. Blackwood, Harriett P. Brown, Ruth T. Carpenter, Anna L. Cole, Janet Cone, Constance Covell, Eleanor B. Desmond, Jane S. Doty, Martha E. Dwyer, Mildred A. Gilberto, Ruth G. Goldman, Ruth E. Hiebert, Murilyn Holland, Sybil H. Lamson, Priscilla C. Larner, Louise C. Lown, Beatrice R. Mandelstam, Dorothy R. Markell, Frances G. McCarthy, Olive A. Minot, Rebecca Moore, Wanda D. Ordon, Charlotte K. Patrician, Faylene E. Paul, Helen J. Sandler, Victoria L. Sears, Calliope Taloumis, Virginia T. Taylor, Helen L. Trayon, Mary V. Wallace.

Bachelor of Science

Elizabeth B. Brodney, Gertrude A. Caro, Ruth C. Dunn, Barbara J. Glidden, Lillian M. Hagopian, Curina J. Harian, Olive Mayper, Phyllis L. Yavner.

Bachelor of Science in Chemistry

Mary L. Herlihy.

ENGINEERING SCHOOL

Bachelor of Science in Civil Engineering

Clifford E. Adams, Vito W. Adams, Richard M. Bagnulo, Edward T. DiBerto, Edmund E. Downer, Harold M. Fish, Nicholas E. Gavrelis, John E. Lundberg Jr., Gerard A. Nardone, Arthur C. Neville Jr., Roland F. Nicklas, Francis A. Obert, John L. Poskus, George E. Sweeney.

Bachelor of Science in Mechanical Engineering

Robert E. Andrus, Frederick E. Baldwin, Robert F. Buckley, Carl H. J. Gottwald, Charles L. Hopkins, Robert E. Hunt, Warren N. Kernander, Robert F. Leahy, Frederick M. MacDonald, Donald G. Milligan, Brewster Morrill, Donald L. Nicklas, Albie R. Petruzzo, Douglas A. Pote, Hayden N. Ringer, Alan W. Sampson, John C. Souter, Calvin B. Steinberg, Richard E. Stevens.

Bachelor of Science in Electrical Engineering

Charles S. Corcoran Jr., Maurice E. Crystal, Robert K. Devejian, Abraham Dranetz, Frederic A. Foss, Richard J. Galeski, George H. Harmon, Walter C. Huening Jr., John G. Mavroides, John S. Meadows, Richard Mergendahl, Andrew M. Monahan, Aubrey L. Perry, Paul Rosen, Robert S. Sherry, George Smith Jr., Winston H. Thomas.

Bachelor of Science in Chemical Engineering

Lloyd E. Beebe, Bremner H. Brown, Thomas J. Carrig, Roland C. Dickson Jr., William S. Farmer Jr., Charles F. Field, James J. Garmon, Robert S. Goldberg, William S. Lenihan Jr., Richard W. Mooney, Charlotte O. Taylor, Norman H. Wacks, Allen E. Willis, Peter Wolynes.

Bachelor of Science in Engineering

Donald Mann.

SCHOOL OF RELIGION

Batchelor of Sacred Theology

James Bodge, B. S. (Tufts).

DIVISION OF UNIVERSITY EXTENSION

Bachelor of Science in Education

Beverly Benson, Elizabeth Shattuck.

GRADUATE SCHOOL

Master of Arts

Kenneth MacKillop Jr. (Music) B. S. (Tufts).

Master of Science

Frank S. Parker (Chemistry) B. S. Chemistry (Tufts).

Master of Education

Lillian A. Belanger, B. B. A. (Boston University); Edna A. Lambert, B. S. in Education (Lowell State Teachers' College); Edythe M. McQuaide, B. S. in Education (Lowell State Teachers' College); Hector G. Pettinati, B. S. in Civil Engineering (Tufts).

FLETCHER SCHOOL OF LAW AND DIPLOMACY

Master of Arts

Louis R. De Filippis, A. B. (DePauw); Paul T. K. Lin, A. B. (University of Michigan.

Degrees given subsequent to the last award of degrees whose names did not previously appear on a degree program:

Doctor of Medicine, Frances F. Lannon, Henry O. Paquin Jr.

Doctor of Dental Medicine, Edward J. Kauskay.

The Boston Globe (Boston, Massachusetts) · 19 Aug 1956, Sun · Page 121

Grossman Employees Receive Awards for Suggestions

REUBEN A. GROSSMAN, chairman of the board, second from right, presents awards to employees Fred Manchester, Donald Mann, James Donovan and George A. Lianos.

Fifteen employees of L. Grossman Sons, Inc. today were presented cash awards for ideas as part of the New Englandwide building materials concern's 60th anniversary celebration.

The awards ranged from $100 to $5. Among the nearly 100 suggestions submitted were ideas for improving safety conditions in the yard and on the road, sales promotion, office efficiency, public relations and customer services.

In presenting the prizes, company vice-president John Grossman said the number of ideas "pleased all of us as an indication of the productive thinking that goes on all the time by our people, who have become part of our 'team'."

"This response shows," he said, "that we have a tremendous reservoir of ideas which can be put to work to help Grossman's growth in service to customers as strongly and rapidly as we have during our long history. I am especially pleased to find that workable ideas came from all departments and from the newest employees as well as from our old-timers. With such productive, positive thinking going on in our ranks we cannot help but progress."

Judges were a committee selected from office staffs and a group elected by yard employees. James P. Donovan was chairman of this award committee.

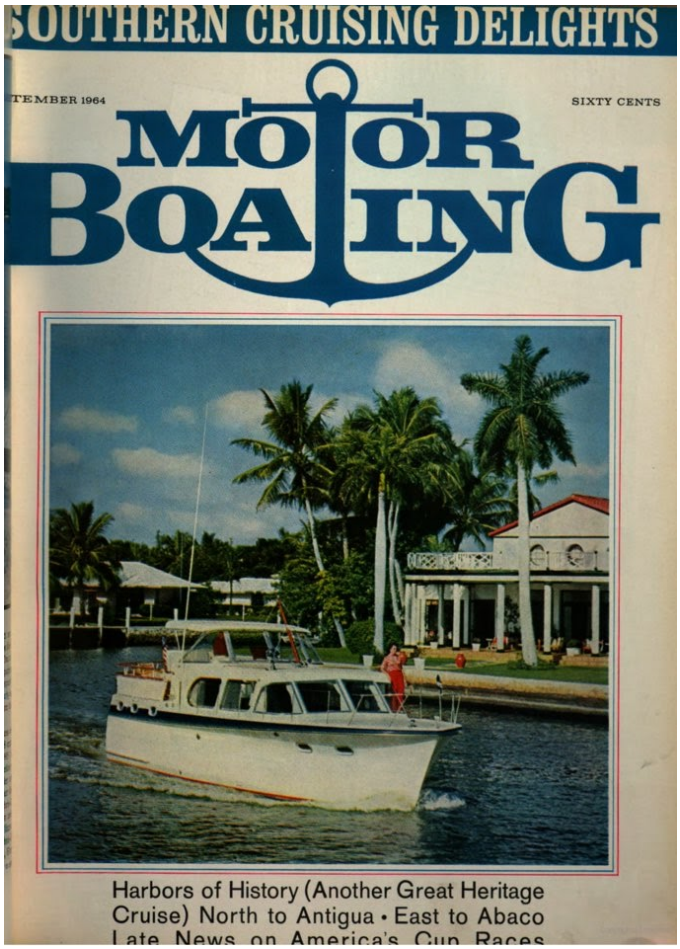
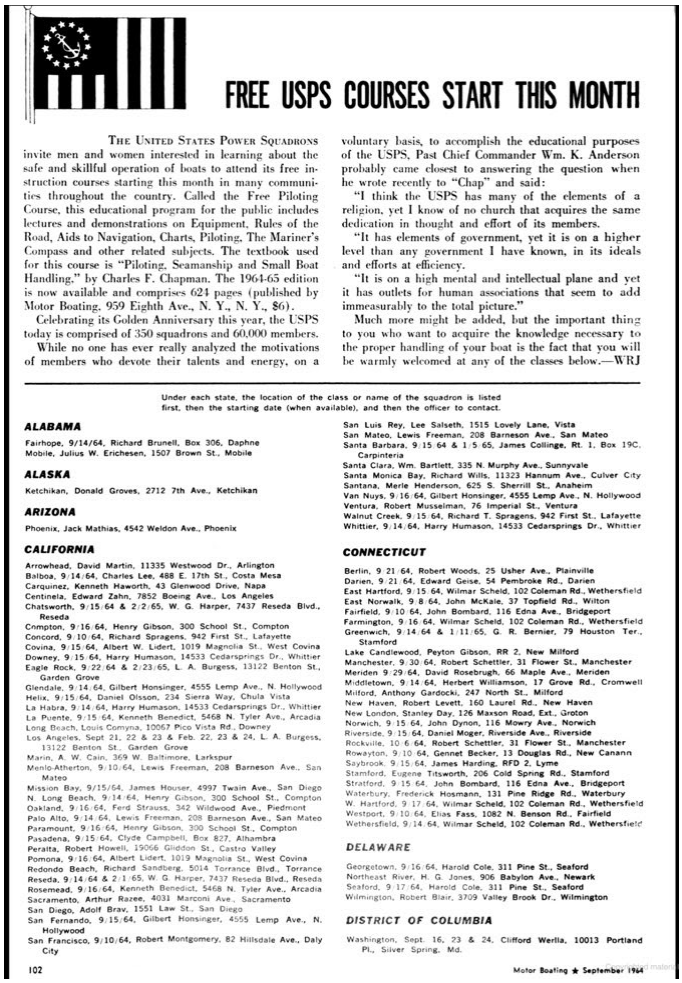
1964 (Sep) - Mentioned in Motor Boating magazine

Full episode recording here - [HP002C][GDrive]



[HP002D][GDrive]



FREE USPS COURSES START THIS MONTH

THE UNITED STATES POWER SQUADRONS invite men and women interested in learning about the safe and skillful operation of boats to attend its free instruction courses starting this month in many communities throughout the country. Called the Free Piloting Course, this educational program for the public includes lectures and demonstrations on Equipment, Rules of the Road, Aids to Navigation, Charts, Piloting, The Mariner's Compass and other related subjects. The textbook used for this course is "Piloting, Seamanship and Small Boat Handling," by Charles F. Chapman. The 1964-65 edition is now available and comprises 624 pages (published by Motor Boating, 959 Eighth Ave., N. Y., N. Y., $6).

Celebrating its Golden Anniversary this year, the USPS today is comprised of 350 squadrons and 60,000 members.

While no one has ever really analyzed the motivations of members who devote their talents and energy, on a voluntary basis, to accomplish the educational purposes of the USPS, Past Chief Commander Wm. K. Anderson probably came closest to answering the question when he wrote recently to "Chap" and said:

"I think the USPS has many of the elements of a religion, yet I know of no church that acquires the same dedication in thought and effort of its members.

"It has elements of government, yet it is on a higher level than any government I have known, in its ideals and efforts at efficiency.

"It is on a high mental and intellectual plane and yet it has outlets for human associations that seem to add immeasurably to the total picture."

Much more might be added, but the important thing to you who want to acquire the knowledge necessary to the proper handling of your boat is the fact that you will be warmly welcomed at any of the classes below.—WRJ

Under each state, the location of the class or name of the squadron is listed first, then the starting date (when available), and then the officer to contact.

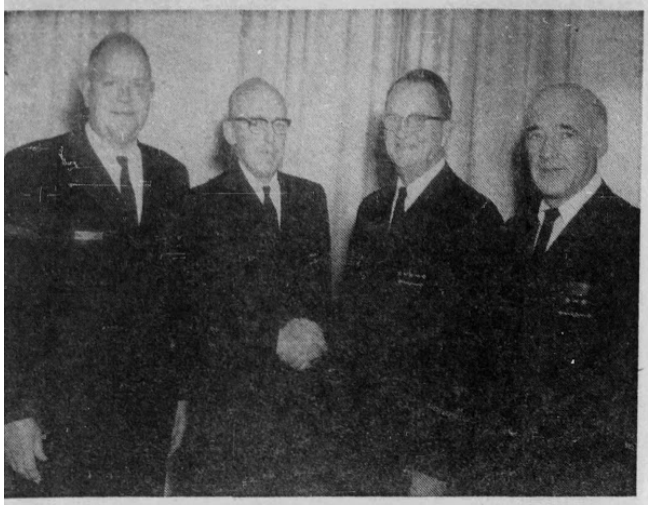
Power Squadron, Coast Guard Auxiliary join hands



NEW BRIDGE of District 12, U.S. Power Squadrons, is shown here with retiring commander. Cmdr James Adam Jr., second left, is congratulated by his predecessor, Past Cmdr Cushing Ellis. At right is Lt Cmdr Robert L. Williams, new executive officer, and at left is Lt Cmdr Arthur C. Hill, administrative officer. (Robert Stilwell Photo)

By BARRY CADIGAN
Boating Editor

Boating's two biggest assets, the U.S. Power Squadron and Coast Guard Auxiliary, have engaged in serious talk on the local level searching for more meaningful cooperation between the two groups.

Instead of harmony and cooperation being mere platitudes on the highest levels, officials of the 1st Coast Guard District of Auxiliary and District 12 (Greater Boston as far as Worcester) actually sat down and compared notes.

The occasion was the 21st Spring Conference, annual meeting and change of watch of District 12, held last week at new Ocean House in Swampscott, a meeting that saw James Adam Jr. of Nobscot Squadron and Wellesley, take over from Cushing Ellis district commander.

Guests during the day-long meeting were Rear Adm. W. W. Childress, commander of the 1st Coast Guard District and District Commodore Ralph W. Anthony, top Auxiliarist in New England.

Adm Childress, one of the finest friends pleasure boating has ever had as commander of the district that includes most of New England, pointed up the similarities between the two groups—Power Squadrons and Auxiliary—and called for an even "closer cooperation" between the two sets of boating volunteers.

"The dynamic programs in boating education pursued by your members," said Adm Childress "have immeasureably aided the Coast Guard's safe boating program."

Commodore Anthony, a member of U.S.P.S. himself since 1946 (three years after joining the Auxiliary), asserted that he has already discussed with U.S.P.S. officials means for better cooperation.

He said arrangements have been made for the two groups to "sit down immediately to work out better, more closer paths" toward the common goal of safety afloat.

District Cmdr Adam, a civil engineer who was Nobscot's first commander six years ago and who does his boating aboard a 32-foot Pacemaker called Great Scot, promised renewed vigor in district programs especially calling for the district safety committee to become a real leader in the boating safety crusade.

Adam told the squadron officials present that every member of U.S.P.S. should be given some job.

"If he was really active you probably couldn't drive him out of U.S.P.S.," said Adam as he gave his cure for the organization's drop-out problem.

Continued growth of the organization nationally was traced by National Vice Cmdr Carl F. Just, who said increased numbers taking piloting classes have been reflected in new admissions annually going from 4700 in 1965 to 6600 at the latest count.

U.S.P.S. now stands at some 70,000 members in 369 separate squadrons.

National Rear Cmdr Jack T. Rehberg, national chairman of engine maintenance course, reported on a number of revisions being made in different course materials used by U.S.P.S.

Officers of District 12 sworn in with Cmdr Adam were Robert L. Williams, executive officer; Arthur C. Hill, administrative officer; Hubert M. Scott, secretary, and Thaxter A. Williams, treasurer.

Cited for 10 years' service to the district as treasurer was James H. Connington, while Warren A. Ellsworth was singled out for five years' service as secretary. A special citation for services above and beyond the call of duty went to veteran District Education Officer Samuel S. Lord.

Appointments for the coming year made by Cmdr Adam included:

Donald Mann, assistant education officer; A. Francis Townsend, admissions; Chester W. Wilson, by-laws and historian; Arthur H. Melanson, chaplain; Charles E. Latham-Brown, commanders cup; and Henry R. Lambert Jr., conference committee.

Also, John Slavin, cooperative charting; William J. Maher, ensign correspondent; Ernest P. Sothman, entertainment; Cushing W. Ellis, finance; Leroy V. Calish, display, and Dana W. Hanchett, flag lieutenant.

Others, Syldon G. Bowie, government liaison; Chester E. Thompson, graphic arts; John F. Sullivan, law; Francis Crowe, legislative; Everett V. Mason, planning; Robert W. Stillwell, photographer; Arthur P. Morris, public relations; Hugo A. N. Semm, radio technical; H. Leroy Newbold, roster; Leon Berig, safety, and Frank A. Morrison, Robert S. Prescott, George J. Jones and Richard F. Cullen, aides.

Winners of the 1965 OIL HEAT Scholarship Awards

The independent fuel oil dealers of Eastern Massachusetts who display the Sleeping Baby Symbol are pleased to announce the names of the 34 winners who share in the $21,000.00 1965 Oil Heat Scholarship Awards. The winners were selected from entrants in an essay competition on the subject: Home . . . Building Block for the Future. The independent fuel oil dealers who have joined together to make these awards possible re-affirm their pledge to safeguard the warmth and security of the homes of their customers.

The winners are:

$1,000.00

Marc Biesoff 223 Lawrence Road, Medford
John Collins 37 Vincent Avenue, Worcester
Nancy Marion Dodge 23 Wyman Road, Lexington
Rita T. Donovan 44 Emmonsdale Road, West Roxbury
Joseph Malay 11 Haskell Street, Beverly Farms
Bruce Hartling Mann 136 Downer Avenue, Hingham
Marlene Rubitsky 61 Locust Street, Winthrop
Paula Stone 46 Greenlawn Avenue, Newton Centre

$500.00

Catherine Aylward 6 Stanton Street, Dorchester
Cynthia Ballentine County Road, North Falmouth
John Emond 39 Elm Street, Saugus
Noel A. Ward 3 Oakland Street, Lexington
Deborah Handy 12 Middle Street, Woods Hole
Gail Hanson Coolidge Road, Norwell
Barbara Ann Harmacinski 236 Sladen Street, Dracut
Marie Jeannette Hayes 19 Rosemary Street, Norwood
Nancy Hewett 150 Wheeler Street, Gloucester
Robert Hunter 648 Hammond Street, Brookline
Geraldine M. Kelleher 192 Andover St., Georgetown
Patricia Lewis 4 Branch Road, South Weymouth
Paula Lynch 37 Whitman Street, Lawrence

Deidre Susan Karem 50 Broadsound Avenue, Revere
Patricia M. McGrath 29 Ripley Road, Belmont
Jeremiah A. McQuillan 3 Glen Street, Marlboro
Martha A. Morrison 26 Jones Avenue, Chelsea
William Naas 14 Elva Road, No. Weymouth
Anne Pierce 165 Upland Road, Cambridge
Martha Chilton Pye 28 Spring Street, Hanson
Lorraine A. Salois 98 Blackstone Street, Blackstone
Gail Shindler 305 Mason Terrace, Brookline
Jean Sullivan 9 Tuttle Street, Saugus
Holly Underwood Reservoir Road, Lunenburg
Joan Warchol 11 Savage Street, Haverhill
Regina Marie Williams 17 Salman Street, West Roxbury

Congratulations to all from the fuel oil dealers who display the sleeping baby symbol

Academic background / Education

Brown University (BA, MA)

Yale University (MPhil, JD, PhD)

Thesis

"Rationality, Legal Change, and Community in Connecticut, 1690–1760."

Academic workInstitutions

Harvard Law School

Washington University in St. Louis

Bruce Hartling Mann (born April 27, 1950)[1] is the Carl F. Schipper, Jr. Professor of Law at Harvard Law School, and the husband of U.S. Senator Elizabeth Warren. He is a legal historian whose research focuses on the relationship among legal, social, and economic change in early America.[2] He began teaching at Harvard Law School in 2006, after being the Leon Meltzer Professor of Law and Professor of History at the University of Pennsylvania Law School.

Education

Mann graduated in 1968 from Hingham High School in Hingham, Massachusetts.

Mann holds A.B. and A.M. degrees from Brown University (1972) and M.Phil., J.D., and Ph.D. degrees from Yale University (1975, 1975, and 1977, respectively). His dissertation is titled "Rationality, Legal Change, and Community in Connecticut, 1690–1760." Mann has been licensed to practice law in Connecticut since 1975.

Career

After graduation, Mann taught at the University of Connecticut School of Law, Washington University in St. Louis, University of Houston, University of Texas, University of Michigan, and the history department at Princeton University. In 1987, Mann started to teach at the University of Pennsylvania Law School.

He is the author of *Neighbors and Strangers: Law and Community in Early Connecticut* (2001) and *Republic of Debtors: Bankruptcy in the Age of American Independence* (2009).

Personal life

Mann is married to Elizabeth Warren (née Herring), the senior United States Senator from Massachusetts and a former law professor. Warren proposed to Mann after he had finished teaching a property class that she had sat in on. Warren officially announced her candidacy for president of the United States on February 8, 2019.

Awards

- SHEAR Book Prize from the Society for Historians of the Early American Republic.
- Littleton-Griswold Prize from the American Historical Association.
- J. Willard Hurst Prize from the Law and Society Association

Information about parents/family of Bruce H. Mann is not being disclosed (as of Oct 2019)

Winners of the 1965 OIL HEAT Scholarship Awards

The independent fuel oil dealers of Eastern Massachusetts who display the Sleeping Baby Symbol are pleased to announce the names of the 34 winners who share in the $21,000.00 1965 Oil Heat Scholarship Awards. The winners were selected from entrants in an essay competition on the subject: Home . . . Building Block for the Future. The independent fuel oil dealers who have joined together to make these awards possible re-affirm their pledge to safeguard the warmth and security of the homes of their customers.

The winners are:

$1,000.00

Marc Biesoff 223 Lawrence Road, Medford
John Collins 37 Vincent Avenue, Worcester
Nancy Marion Dodge 23 Wyman Road, Lexington
Rita T. Donovan 44 Emmonsdale Road, West Roxbury
Joseph Malay 11 Haskell Street, Beverly Farms
Bruce Hartling Mann 136 Downer Avenue, Hingham
Marlene Rubitsky 61 Locust Street, Winthrop
Paula Stone 46 Greenlawn Avenue, Newton Centre

$500.00

Catherine Aylward 6 Stanton Street, Dorchester
Cynthia Ballentine County Road, North Falmouth
John Emond 39 Elm Street, Saugus
Noel A. Ward 3 Oakland Street, Lexington
Deborah Handy 12 Middle Street, Woods Hole
Gail Hanson Coolidge Road, Norwell
Barbara Ann Harmacinski 236 Sladen Street, Dracut
Marie Jeannette Hayes 19 Rosemary Street, Norwood
Nancy Hewett 150 Wheeler Street, Gloucester
Robert Hunter 648 Hammond Street, Brookline
Geraldine M. Kelleher 192 Andover St., Georgetown
Patricia Lewis 4 Branch Road, South Weymouth
Paula Lynch 37 Whitman Street, Lawrence

Deidre Susan Karem 50 Broadsound Avenue, Revere
Patricia M. McGrath 29 Ripley Road, Belmont
Jeremiah A. McQuillan 3 Glen Street, Marlboro
Martha A. Morrison 26 Jones Avenue, Chelsea
William Naas 14 Elva Road, No. Weymouth
Anne Pierce 165 Upland Road, Cambridge
Martha Chilton Pye 28 Spring Street, Hanson
Lorraine A. Salois 98 Blackstone Street, Blackstone
Gail Shindler 305 Mason Terrace, Brookline
Jean Sullivan 9 Tuttle Street, Saugus
Holly Underwood Reservoir Road, Lunenburg
Joan Warchol 11 Savage Street, Haverhill
Regina Marie Williams 17 Salman Street, West Roxbury

Congratulations to all from the fuel oil dealers who display the sleeping baby symbol

1968 - Bruce H Mann of Hingham received National Merit Scholarship

Full page : [HN00PK][GDrive]

The Boston Globe (Boston, Massachusetts) · 02 May 1968, Thu · Page 14

National Merit Scholarships

Fifty-nine talented Massachusetts high school students have been named winners of National Merit Scholarships and admitted to colleges of their choice next Fall.

Boston College High School and Lexington High School tied for individual honors in Massachusetts with four winners each. Phillips Exeter Academy, Exeter, N.H. led all New England schools with 11 winners.

Among the more than 2800 winners announced today are 500 students receiving the first "National Merit $1000 Scholarships."

Following is a list of winners from Massachusetts:

Robert L. Collings, Allston; Janet R. Potash, Amherst; William Burroughs, Arlington; John C. Stearns, Auburn; Robert E. Shapiro, Belmont; Albion R. Fletcher, Braintree; William J. Keane, Brighton; Burton E. Rosenthal, Brookline; Stephen P. Darcy, Cambridge; John W. Keene, Centerville; Evelyn Chimelis, Chicopee; Matt S. Magoun, Cochituate; Warren R. Judd, Cohasset; David L. Clark, Dennis; James J. Little, Dorchester; Stephen J. Maguire Dorchester; Michael L. Ziegler, East Weymouth; Mary E. Black, Fairhaven; Michael R. Harris, Hamilton; Jonathan R. Harris, Haverhill; Bruce H. Mann, Hingham; and Forrest G. Clark, Holliston.

Also David L. Wernick, Holyoke; Eva B. Pitha, Lenox; Cedric C. Chao, Lexington; David A. Grayson, Lexinton; Ruth M. Ritter, Lexington; Mark J. Woodward, Lexington; Ellen J. Messing, Longmeadow; Robert N. Shapiro, Marblehead; Arthur P. Bergeron, Marlboro; Christine Peterson, Melrose; Richard C. Compton, Mount Hermon; Susan E. McCarthy, Newton Lower Falls; Gretchen L. Mueller, Newtonville; Robert C. Weiss, Newtonville; Vernon J. Harward, Northampton; Robin C. Rekas, Northbridge; Dana D. Craig, Norwood; John J. Bennett, Quincy and Dianne G. Lindewall, Quincy.

Also Keith D. White, Reading; Carol J. Garner, Sagamore; Katharine Anderson, Sheffield; Christine Darby, Sherborn; George R. Odell, Shirley Center; Margaret A. Power, Somerville; Jennifer N. Waters, South Hadley; Elaine C. Todd, Stoneham; Robert A. Snowdale, Stoughton; Paul E. Bailey, Swampscott; Albert W. Sprague, Walpole; James J. Heffernan, Watertown; Regina Schwabe, Wayland; Robert E. Kossack, Westboro; Stephen J. Roper, Westminster; Mark S. Dionne, Westwood; Peter K. Enberg, Westwood and Dean R. Gallant, Winchester.

Harold Mann

Retired metallurgist

CUMMAQUID — Harold C. Mann, 80, of Keveney Lane died yesterday at his home. He was a retired engineer in metalurgy.

Born in Dorchester, and a former resident of Watertown and Arlington, Mr. Mann was a former employee of the Watertown Arsenal. He also was a member of the Howard Lodge AF & AM of South Yarmouth.

He is survived by his wife, Gladys S. (Lapham) Mann; two sons, Robert L. Mann of Dover and Donald Mann of Hingham; a daughter, Mrs. Shirley Klough of Cummaquid; nine grandchildren, and two great-grandchildren.

The U.S. Uranium Industry: Regulatory and Policy Impediments

Thomas E. Drennen and Jessica Glicken
Energy Policy and Planning Department
Sandia National Laboratories
Albuquerque, NM 87185

Acknowledgments

The authors would like to thank several individuals for their assistance with this project. Melissa Mann and Rod Fisk of Edlow International provided necessary background research for several sections of the report. Nancy Hetrick of Tech Reps, Inc., assisted the authors in editing and formatting the manuscript. Vicki Bruch and Linda Branstetter, both employees of Sandia National Laboratories, reviewed the document and provided useful feedback.

Abstract

The Energy Policy Act of 1992 required the U.S. Department of Energy to develop recommendations and implement government programs to assist the domestic uranium industry in increasing export opportunities. In 1993, as part of that effort, the Office of Nuclear Energy identified several key factors that could (or have) significantly impact(ed) export opportunities for domestic uranium. This report addresses one of these factors: regulatory and policy impediments to the flow of uranium products between the U.S. and other countries. It speaks primarily to the uranium market for civil nuclear power. Changes in the world political and economic order have changed U.S. national security requirements, and the U.S. uranium industry has found itself without the protected market it once enjoyed. An unlevel playing field for U.S. uranium producers has resulted from a combination of geology, history, and a general U.S. political philosophy of nonintervention that precludes the type of industrial policy practiced in other uranium-exporting countries. The U.S. has also been hampered in its efforts to support the domestic uranium-producing industry by its own commitment to free and open global markets and by international agreements such as GATT and NAFTA. Several U.S. policies, including the imposition of NRC fees and licensing costs and Harbor Maintenance fees, directly harm the competitiveness of the domestic uranium industry. Finally, requirements under U.S. law, such as those in the 1979 Nuclear Nonproliferation Act, place very strict limits on the use of U.S.-origin uranium, limitations not imposed by other uranium-producing countries. Export promotion and coordination are two areas in which the U.S. can help the domestic uranium industry without violating existing trade agreements or other legal or policy constraints.

ALGERINA PERNA : SUN STAFF PHOT

A worker at Rukert Terminals guides empty cylinders used to transport natural uranium hexaflouride during unloading from the TLI Aquila. The ship's two 80-ton cranes lifted the containers out of the hold and onto trucks

NUCLEAR FUEL AT SEA

Daily radiation readings and security drills are routine aboard the TLI Aquila, a ship that carries uranium from country to country.

By PAUL ADAMS
SUN STAFF

STANDING on the bridge of the *TLI Aquila*, Capt. Adelbert Hansen reaches into his faded shirt pocket and pulls out a small dosimeter, a pen-light-shaped device every crew member carries to monitor their exposure to radiation from the ship's uranium-laden cargo.

Pointed toward the Baltimore skyline, the device gives a reading of less than one microsievert — a standard unit of measure that represents a tiny fraction of the level considered safe by government standards.

"See, I don't worry," Hansen said, referring to the 48-inch diameter cylinders filled with uranium that the ship specializes in transporting. "I like this ship. It's a little ship, but it's fast. It's fast."

Daily dosimeter readings are just one of the standard precautions taken aboard the 330-foot *Aquila*, a blue-hulled freighter that criss-crosses the Atlantic, taking multi-million-dollar shipments of uranium from one refining facility to another before it is finally ready to be consumed as fuel in a nuclear power plant. With its proximity to nuclear customers in the Midwest, Baltimore is a regular port of call.

The daily attention to safety aboard the *Aquila* is a reminder that the ship's cargo is not ordinary. Regulations govern everything from crew selection to how the cargo is packaged and loaded to ensure against a nuclear accident. And with the world on high alert for terrorists, security around hazardous cargo is a top priority.

TLI AQUILA

The freighter, which docks at Baltimore (above) and hauls uranium across the Atlantic, features a double-lined hull and redundant electrical and fire-suppression systems. Other details:

Length	330 feet	Crew complement	13, mostly Russian
Cruising speed	15 knots	Special equipment	Six radiation detectors, hazardous materials suits
Carrying capacity	4,700 metric tons		
Cargo space	6,800 cubic meters		

"Because we're talking about inherently dangerous materials, it is probably the most highly regulated form of transportation in the world," said Lorne Green, secretary general of the World Nuclear Transport Institute, an industry trade group based in London. "It's like playing the piano — it looks easy until you try it yourself."

The ship's Maryland operator, Transportation Logistics International, is one of a handful of companies in the world that specialize in the politically charged, bureaucratic work of trans- [*See Uranium, 4D*]

[HN00LN][GDrive]

"Because we're talking about inherently dangerous materials, it is probably the most highly regulated form of transportation in the world. It's like playing the piano — it looks easy until you try it yourself."

Lorne Green, *secretary general of the World Nuclear Transport Institute*

Nuclear fuel a dangerous cargo at sea

[*Uranium, from Page 1D*]

porting radioactive material.

"It's a job that takes many

years of both formal and informal on-the-job training," said Rodney H. Fisk, Transportation Logistics' chief executive and a former South African diplomat. "For most people, once you get into this field, you stay in it. It's not a transitory job at all."

A self-described conservative businessman with an accent that reflects his Cape Town roots, Fisk's job is to communicate with regulators and Cabinet-level officials in overseas governments. That task has taken on added urgency as the International Atomic Energy Agency, International Maritime Organization and various government agencies here and abroad study ways to improve the security of hazardous cargo in the wake of the Sept. 11, 2001, attacks.

Those moves dovetail with the Department of Homeland Security's efforts to improve security at U.S. seaports. Coast Guard and Customs officials have stepped up inspections of ships and cargo, and ports have spent millions installing new surveillance systems, fencing and other security measures.

Though the uranium Transportation Logistics transports is well below weapons-grade, it could still be a potential target. The company says it is "absolutely fastidious" about following the volumes of international and domestic regulations designed to keep the cargo safe and out of unauthorized hands.

The nuclear transportation industry has a mostly unblemished track record. While vehicle accidents have occurred over the past 40 years, industry experts say, there has never been a deadly radioactive spill or loss recorded during the transport of nuclear materials. Uranium shipments have rolled across the docks in Baltimore for decades with little notice.

Reduced risk

Transportation Logistics won't talk about its security measures other than to say that some procedures change when national alert levels shift from yellow to orange. But the company points to a number of factors that it says reduce the risk that the cargo it carries could ever be diverted for illegal purposes.

The uranium hexafluoride and other materials it transports are extremely dense, making each cylinder so heavy it can't be lifted without a crane or other special equipment. Even if one were stolen, the material would have to undergo considerable processing that requires sophisticated technology to be used in a nuclear bomb.

And since it emits a relatively low level of radiation compared with other radioactive materials, it would have limited value as a "dirty bomb," which uses conventional explosives to spread radioactive materials over a wide area, Fisk said.

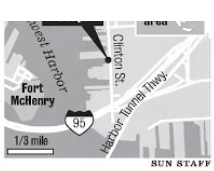
"I think ... they would look for something that's far more potent and dangerous," he said.

No firm statistics are available on the annual number of uranium shipments. But the global nature of the industry makes transportation a critical component in the nuclear fuel cycle.

It begins when uranium ore is mined in Canada, Russia, Australia and other uranium-rich countries. From there, it undergoes about a half-dozen steps in the refining process until the concentration of U-235 isotopes reaches nearly 5 percent, making it suitable for use as nuclear fuel. For economic and competitive reasons, each of the refining steps might take place in a different country.

"There's material that might originate out of the ground as ore in Canada, go to Europe to be partially processed, come to the U.S. to be processed further, then go back to Europe and finally end up in Japan," said Melissa Colvin Mann, a Transportation Logistics partner with a background in nuclear nonproliferation and international relations. "So there's a constant flow of material."

Formed in 1998, the company has 13 employees in a suburban office park in Burtonsville in Montgomery County and a small number of agents in offices overseas. Its five founding partners own 60 percent of the company, while the other 40 percent is held by a German affiliate, Nuclear Cargo Service. Customers include uranium mines, refining facilities and power plants.



SUN STAFF

The company doesn't disclose its revenue, but industry experts said nuclear transportation is a niche that commands premium rates because of the high value of the cargo and the expertise involved.

"It's not a big market, so there aren't a whole lot of players," said Felix Killar, director of fuel supply and material licensees for the Nuclear Energy Institute. "But [Transportation Logistics] is one of the players."

The company's biggest coup was landing a contract to transport tons of uranium that once armed Soviet nuclear weapons aimed at the United States. Part of a landmark arms-reduction treaty between the United States and Russia, the "Megatons to Megawatts" project involves diluting 90 percent pure weapons-grade uranium into a more benign form so it can be converted into fuel to produce electricity. The material is diluted in Russia before being shipped.

The program is a joint venture between Bethesda-based U.S. Enrichment Corp. and its Russian counterpart, Tenex. The 20-year, $8 billion program has converted the equivalent of about 7,000 warheads, creating enough nuclear fuel to power a city the size of Boston for about 270 years. By the time the program ends in 2013, the equivalent of 20,000 warheads will have been converted into enough fuel to power the entire United States for about two years, U.S. Enrichment officials say.

"It's a dream"

In addition to providing needed jobs for Russian scientists, the purpose of the project is to keep that country's nuclear materials from falling into the hands of terrorists or rogue nations. For Mann, whose training is in nuclear nonproliferation, the U.S. Enrichment contract is the opportunity of a lifetime.

"It's a dream," she said. "It really is a dream."

Since the *Aquila* doesn't call at Russian ports, Transportation Logistics uses other commercial ships to bring the diluted warhead material, some of which has passed through Baltimore, to the United States.

But the bulk freighter is the only ship in the world that is exclusively chartered to carry so-called "front-end" nuclear material, which consists of fresh uranium from the time it is mined until it is manufactured into fuel rods and delivered to a nuclear power plant. Front-end uranium is considered relatively benign and less controversial compared with back-end material, which consists of highly radioactive spent fuel or nuclear waste.

"It's radioactive, but not terribly so," said William H. Miller, a professor in the nuclear engineering department at the University of Missouri in Columbia. "You can stand right next to the truck and the [radiation level] would not be much elevated above background levels."

It is the movement of back-end fuels that often inspires protests from environmental and anti-nuclear groups. But environmentalists say that doesn't mean that front-end fuels like those aboard the *Aquila* are totally safe.

"I think this whole [uranium transport] industry is one that doesn't have a lot of public scrutiny on it due to the limited resources of the nonprofit community," said Tom Clements, a senior nuclear campaigner for global environmental group Greenpeace International. "So a lot of this happens without the proper public oversight, but there's definitely risks."

Company officials point out that the industry frequently goes beyond government safety requirements.

The cylinders that carry uranium are made of five-eighths-inch steel and are built to withstand intense fire, collision and other pressures. The uranium is extremely dense and is not explosive, unlike many other hazardous materials.

If you rammed a truck into one, Fisk said, "You'd have to write off your truck, probably."

The Antigua- and Barbuda-flagged *Aquila*, which calls at Rukert Terminals in Canton, was designed and certified to carry hazardous materials ranging from natural uranium to finished fuel assemblies worth millions of dollars each. Built in 2000, the ship has a double-layered hull, redundant electrical systems and cooling and ventilation equipment that typical commercial vessels don't have. In the event of fire, carbon dioxide tanks will flood the cargo hold, starving the blaze of oxygen while sprinklers douse the flames.

At mealtime, the ship's 13-member crew can look up from their plates in the mess hall and know instantly how much radiation their bodies are absorbing. Six digital dosimeters are mounted on walls throughout the ship, supplementing the devices crew members carry in their pockets.

Each day, the ship's officers take a reading from the six dosimeters and e-mail the data to headquarters. Every crew member's cumulative dose of radiation is recorded in a log kept on the bridge. Recent readings show the crew is receiving a radiation dose only slightly above natural background levels.

Before crew members can work on the ship, background checks are conducted by both the company and an outside contractor. Each member also must take part in safety drills and be certified to handle hazardous materials. Because of the added expertise required, the crew gets paid a premium over their regular salary, a company official said.

The training crew members must complete covers a wide range of scenarios, including everything from a broken seal on a uranium cylinder to an attack by pirates or terrorists. Details of each crew member's training are recorded in a three-ring binder.

"We drill at least weekly, but sometimes twice per week," said Chief Mate Oleg Stukalov, a native of St. Petersburg, Russia. Most of the crew is Russian, though the captain is German.

Every time the ship comes to Baltimore it is met by Mark T. Lambert, president of Transportation Logistics' shipping subsidiary, who has a background in military intelligence and international logistics.

When new cargo arrives, he positions the cylinders of uranium in the cargo hold based on complex mathematical equations that take into consideration the radioactivity level of each shipment. Regulations govern how much space must separate the containers to prevent them from interacting and causing a radioactive release.

"When you're handling these materials, you can't just throw them on the vessel any old where," Lambert said.

Multiple certifications

The scrutiny continues once the ship leaves port. The design and construction of the containers used to carry the uranium must be certified by international regulatory agencies and government regulators in every country that the material will travel to. That means that cylinders have to be certified in every country where the ship makes a port call, regardless of whether the uranium ever leaves the vessel.

"This can sometimes take a year to a couple of years to get completed," said Norman Ravenscroft, president of Transportation Logistics.

While in Baltimore recently, the *Aquila* off-loaded empty cylinders used for transporting natural uranium hexafluoride, which from a distance look like giant beer kegs. The crew used the ship's two 80-ton cranes to lift the containers out of the hold and onto trucks, which transported them to a nearby warehouse. Radioactive cargo stays in port only long enough to be transferred to a truck for delivery to customers, usually within one to two days.

Before leaving Baltimore, the ship took on another shipment of radioactive cargo destined for customers in Europe. The company keeps the precise contents and destination secret, for competitive and security reasons.

"We're protecting our customers' financial assets," Fisk said. "You're looking after it because there is an obligation, obviously, that the material is protected and won't fall into unauthorized hands."

CSIS and the Danish Institute for International Studies (DIIS) are pleased to invite you to the launch of the new, interactive Governing Uranium website. Based on the results of the Governing Uranium research project, the website allows users to explore the front-end of the nuclear fuel cycle and 'follow the uranium trail' from mining to conversion. It offers information, maps and analysis on the regulatory structures and industry best practices that govern uranium production and trade across

afteen uranium producing and consuming states.

Melissa Mann is President of URENCO USA Inc., the holding company for Louisiana Energy Services and its URENCO USA uranium enrichment facility, and the URENCO Group's Executive Director of Strategic& Government Affairs. The URENCO USA enrichment facility is located in Lea County, New Mexico and was the first facility to be licensed, constructed and operated under a Nuclear Regulatory Commission-approved Combined Construction and Operating License. URENCO USA represents an investment of roughly $5 billion to-date. A New Mexican by birth, Melissa is privileged to represent URENCO USA along with its more than two hundred New Mexican and Texan employees.

Melissa has spent her nearly 30-year career in the service of the commercial nuclear energy industry and as a licensee of the U.S. Nuclear Regulatory Commission. From 2006 to 2013, Melissa served as Manager of Marketing & Sales for URENCO, Inc., managing relationships with North American utilities and nuclear fuel cycle companies. This work entailed negotiating and administering a sales contract portfolio that significantly contributed to U.S. demand for uranium enrichment and hundreds of millions of dollars in revenue annually.

Prior to joining URENCO ,as Vice President for Regulatory & Risk Assessment at The Ux Consulting Company from 2004 to 2006,Melissa supported commercial nuclear utilities and fuel cycle companies in managing risks associated with economic, regulatory, export control and nuclear energy policy matters.

This role built on nearly two decades managing the international movement of radioactive materials and specializing in non-proliferation policy and export controls. She started her career in 1989 as an International Affairs Specialist with Edlow International Company eventually serving as the company's International Vice President, and then undertook similar roles as Director of Research & Consulting at Transportation Logistics International and as Executive Vice President of TLI Shipping, LLC, a specialized ocean servicefor international transport of sensitive commodities including fissile nuclear materials.

Melissa holds a degree in International Relations from Rhodes College.

Virus kills workers in laboratory

From Norman Crossland

Bonn, August 24

Four people have died in Frankfurt and Marburg, West Germany, from a strange virus infection which they caught by handling monkeys used in scientific experiments. Twelve people are ill, some of them seriously.

The illness, thought to be a kind of yellow fever, broke out in the Paul Ehrlich scientific institute in Frankfurt and at the Behring works at Marburg, where vaccines are made. At both places monkeys from Uganda have been used for research purposes. Two of those who died, a man and a woman, were laboratory assistants and the others, both men, looked after the animals

Pains in limbs

Professor Martini of University Clinic Marburg, said that the victims were at first affected by headaches and pains in the limbs They then became feverish and came ou. in a rash, and in severe cases there was a collapse of the circulatory system.

He added that the degree of infection had not been experienced in Europe before. The Institute of Hygiene in Frankfurt is trying to find out exactly what kind of illness it is so that it can be effectively treated.

GIs Assist 11 Stricken by Rare Disease

FRANKFURT (UPI)—As two additional deaths at Marburg brought fatalities to four, U.S. soldiers Thursday came to the aid of 11 victims of a mysterious tropical disease in the state of Hesse.

A spokesman at the U.S. Army's 97th General Hospital here said an urgent request was received from this city's University Clinic for blood from persons who have been immunized against yellow fever, which the disease closely resembles.

"We found 21 personnel from the hospital who went to the clinic and contributed blood," the spokesman said. "We also released 60 pints of blood from the hospital bank."

He explained all members of the U.S. forces receive yellow fever inoculations on entering the services.

The fever was transmitted to research workers and animal handlers in Frankfurt and Marburg by monkeys under study by the Behring Werke, a subsidiary

(Cont. on Page 24, Col. 4)

GIs Aiding Victims of Rare Malady

(Continued from Page 1)

of the Hoechst chemical firm, and the Paul Ehrlich Institute.

Four of 15 persons who were in contact with the monkeys have died of the disease. The others were reported in serious condition and in quarantine, some in a Marburg hospital and the others in Frankfurt's University Clinic.

The animals—green monkeys—were shipped recently from Uganda. They are known to build up a natural immunity to yellow fever in their African habitat.

Yellow fever is normally transferred to humans by a mosquito, and is caused by a virus that enters the blood stream. The spokesman at the military hospital said blood transfusions would be given, basically, in hopes that the anti-bodies contained by an immunized person would help counteract the virus.

Dr. Guenther Heymann, a leading research worker at the Paul Ehrlich Institute, claimed it was "the first and only time in the world" that the disease—if it was yellow fever—had been transmitted by monkeys.

However, the director of the University Clinic in Marburg, Prof. Gustav Adolf Martini, told a news conference Thursday that an autopsy on one of the victims had failed to show for certain the cause of death.

Tropical Fever Fatal to 4 Researchers

* * *

MARBURG, Germany (UPI) — A mysterious tropical disease, apparently transmitted by monkeys, has claimed the lives of four German research workers and has hospitalized 15 other persons, six in serious condition it was announced Saturday.

Research officials stressed that no danger existed for the general public since there was no evidence the disease was communicated between persons.

All of the victims so far had worked with a consignment of green monkeys from Uganda.

Blood donated by 21 American GIs and nurses and 60 pints given by the U.S. Army's 97th General Hospital was being kept as a safeguard in the event the hospitalized victims needed transfusions.

* * *

Experts Baffled

The nature of the unknown deadly virus was said to be baffling some of the world's foremost medical experts.

All of the victims are research workers connected with the university clinic here and the Paul Ehrlich Institute in Frankfurt.

A British microbiologist, George Williamson Dick, left here Saturday with organic and blood samples from the bodies of the four dead.

He told a news conference earlier that he had never encountered the symptoms of the disease before. He is one of the world's leading experts on tropical disease and also is a noted pathologist.

- Disease Marburg virus disease
- Virus strain Marburg virus and Ravn virus
- Location West Germany and Yugoslavia
- First outbreak Marburg and Frankfurt
- Confirmed cases 32
- Deaths 2
- Territories 2

Marburg virus was named after Marburg in Germany where the first such outbreak ever, occurred (Above image-This negative stained transmission electron micrograph (TEM) depicts a number of filamentous Marburg virions, which had been cultured on Vero cell cultures, and purified on sucrose, rate-zonal gradients.)

The 1967 Marburg virus outbreak in West Germany was the first outbreak of Marburg virus disease.[1] It started in West Germany in early August 1967 when 30 people became ill in the German towns of Marburg and Frankfurt and two in Belgrade, Yugoslavia (now Serbia). One of these cases was diagnosed retrospectively. The outbreak involved 25 primary Marburg virus infections and seven deaths, and six non-lethal secondary cases.[2]

Overview

In early August 1967, patients with unusual symptoms indicating an infectious disease were admitted to the university hospitals in Marburg and Frankfurt. The first patients were treated in their homes for up to 10 days, even though the illness was described as beginning suddenly with extreme malaise, myalgia, headache, and a rapid increase in body temperature to as high as 39 °C (102.2 F) or more. Although the clinical symptoms were not very alarming during the first 3–4 days, additional symptoms and signs appeared at the end of the first week. The patients were therefore admitted to a hospital. In some cases, patients died from severe hemorrhagic shock on the day after hospital admission. Severe hemorrhagic shock occurred in ~25% of patients. All patients who died had hemorrhagic shock. The first infections occurred in laboratory workers who were conducting necropsies on imported African green monkeys. [3]

The incubation time of Marburg virus disease could only be estimated retrospectively, after the source of infection and the date of exposure were known. Incubation ranged from 5 to 9 days, with an average of 8 days. The ratio of primary to secondary infections was 21:3 in Marburg, 4:2 in Frankfurt, and 1:1 in Belgrade. Three cases of secondary infection resulted from inadvertent needle-stick inoculations; in one case, a pathology technician cut himself on the forearm with a knife during a postmortem examination. Airborne transmission between humans did not occur, as indicated, for example, by the instance of a young man who slept in the same bed with his brother only a couple of days before he died; the brother did not develop disease and was seronegative for Marburg virus disease six months later.[4]

History

The Marburg virus disease made reappearance in 1975, 1980, 1987, 1990, 1998–00, 2004–05, 2007, 2008 and 2017. The seven deaths out of the 31 initially diagnosed infections during the 1967 Marburg virus outbreak represents a case fatality rate of 23%. The 32nd case was diagnosed retroactively via serology.[5]

Andrew W. Marshall (September 13, 1921 – March 26, 2019)[1] was an American foreign policy strategist who served as director of the United States Department of Defense's Office of Net Assessment from 1973 to 2015. Appointed to the position by President Richard Nixon, Marshall remained in office during all successive administrations that followed until his retirement on January 2, 2015.[2][3][4] He was succeeded in the role by James H. Baker.[5]

Biography

Raised in Detroit, Michigan, Marshall pursued autodidactic interests in history, literature and the natural and social sciences from a young age. He graduated from Cass Technical High School (where he trained in machining and received the second-highest score on a citywide aptitude test for honors students similar in provenance to the SAT) in 1939. After briefly working in a factory and attending the University of Detroit for a year, he dropped out to take a position at the Murray Body Company, where he manufactured machine tools used in fabricating British airplane parts. Unable to serve in World War II due to a heart murmur, Marshall continued to work at Murray for the remainder of the war. He eventually resumed his formal studies at Wayne State University in 1943.

Marshall was admitted to the University of Chicago with graduate standing in 1945; under the chancellery of Robert Maynard Hutchins, students who were not enrolled in the generalist "Chicago Plan" undergraduate program pursued a course of study that led to a master's degree instead of the baccalaureate. Strongly influenced by Friedrich Hayek, he earned an M.A. in economics from the institution in 1949. His master's thesis was a sensitivity analysis of Lawrence Klein's econometric model of the US economy; influential for its methodology, it has never been published except for a short abstract.[6][7][8]

After electing to defer his studies in favor of eventually pursuing a Ph.D. in statistics (a program not yet offered by the University of Chicago), Marshall joined the RAND Corporation, the original "think tank," at the behest of mentor **W. Allen Wallis** in 1949. While he would briefly return to academia to cover Wallis's courses during the 1953-1954 term and continued to take statistics courses at George Washington University, **Marshall soon gained the cachet of being part of "a cadre of strategic thinkers" that coalesced at the RAND Corporation in the 1950s and 1960s,** a group that also included Charles J. Hitch, [Herman Khan (born 1922)], [James Rodney Schlesinger (born 1929)] and Daniel Ellsberg. Notably, he worked with Kahn on developing and advancing Monte Carlo methods.

Schlesinger would later become the U.S. Secretary of Defense and personally oversaw the creation of the Office of Net Assessment. The original main task of the office was to provide strategic evaluations on nuclear war issues. James Roche, Secretary of the Air Force in the administration of George W. Bush, worked for Marshall during the 1970s.[9]

Andrew Marshall was consulted for the 1992 draft of Defense Planning Guidance (DPG), created by then-Defense Department staffers I. Lewis Libby, Paul Wolfowitz, and Zalmay Khalilzad; all of whom took to influential roles in the administration of George W. Bush.[10]

> We studied RMA exhaustively. Our great hero was Andy Marshall in the Pentagon. We translated every word he wrote.
>
> —General Chen Zhou, PLA[11]

Marshall has been noted for fostering talent in younger associates, who then proceed to influential positions in and out of the federal government: "a slew of Marshall's former staffers have gone on to industry, academia and military think tanks."[12] **Dick Cheney, Donald Rumsfeld, and Wolfowitz, among others, have been cited as Marshall "star protégés**."[13]

In 2003, Marshall commissioned a report for the Pentagon predicting that abrupt climate change could bring the planet to the edge of anarchy as countries develop a nuclear threat to defend and secure dwindling food, water and energy supplies.[14] The report, authored by Peter Schwartz and Doug Randall, predicted that 'catastrophic' shortages of water and energy supply would become increasingly harder to overcome, plunging the planet into war by 2020. Schwarz and Randall further claimed that major European cities would be sunk beneath rising seas as Britain is plunged into a 'Siberian' climate by 2020.[15] At the time of the report's publishing, it became notable for its link to Marshall and its accusations that leadership of the Pentagon purportedly "covered up" the report for four months until it was obtained by the British weekly *The Observer*.[16]

In an interview in 2012, Major General Chen Zhou, the main author of four Chinese defence white papers, stated that Marshall was one of the most important figures in changing Chinese defence thinking in the 1990s and 2000s.[17]

Andrew Marshall funded and published three best selling books by Michael Pillsbury: *Chinese Views of Future Warfare* in 1998,[18] *China Debates the Future Security Environment*,[19] and in 2015 an international bestseller, *The Hundred-Year Marathon: China's Secret Strategy to Replace America*.[20] According to a biography, *The Last Warrior: Andrew Marshall and the Shaping of Modern American Defense Strategy*, "There was every reason for Marshall to expect that Chinese modes of thought would be even more alien to American ways of thinking than the Soviet leadership's had been, and that some insight into the thinking of China's political and military leaders could be gleaned from surveying open source writings. Pillsbury's work on China, which Marshall had encouraged and supported since the early 1970s, illustrates both points."[21] According to *The New York Times* March 26, 2019 obituary of Marshall, "His gift was the framing of the question, the discovery of the critical question," said Michael Pillsbury, a China expert who advised and worked with Mr. Marshall throughout his career."[22] The *Washington Post* obituary about Marshall stated, "He had an uncanny ability to pick out only the most significant questions, then to drill down deeply," Pillsbury, a colleague of 45 years, said in an interview. "He developed an iconoclastic, contrarian image."[23]

Foreign Policy named Marshall one of its 2012 Top 100 Global Thinkers, "for thinking way, way outside the Pentagon box".[24]

Death

Marshall died on March 26, 2019 in Arlington, Virginia, at the age of 97.[25][26] House Armed Services Committee ranking member Rep. Mac Thornberry (R-TX) announced his death during a hearing, saying, "I can think of fewer people who have had a bigger impact of focusing our defense efforts, our national

security, in the right direction than Mr. Marshall. He has been before our committee I don't know how many times over the years. So I wanted to note that passing, but also to honor his memory because he made such a difference."[27]

ANDREW MARSHALL

Pentagon threat expert for decades dies

NEW YORK TIMES

Andrew Marshall, a Pentagon strategist who helped shape U.S. military thinking on the Soviet Union, China and others for more than four decades, died Tuesday in Alexandria, Virginia. He was 97.

His death was confirmed by Jaymie Durnan, his executor.

Marshall, as director of the Office of Net Assessment, was the secretive futurist of the Pentagon, a long-range thinker who both prodded and inspired secretaries of defense and high-level policymakers. Virtually unknown among the wider public, he came to be revered inside the Defense Department as a mysterious Yoda-like figure who embodied an exceptionally long institutional memory.

In the early 2000s, at a time when the Pentagon was focused on counterinsurgency and wars in Afghanistan and Iraq, Marshall urged officials to focus on the challenge of China — a view that many considered outdated. But today, national security officials are increasingly adopting Marshall's view of China as a potential strategic adversary, an idea now at the heart of national defense strategy.

Andrew Walter Marshall was born Aug. 13, 1921, in Detroit to John and Katherine Marshall

Marshall married Mary Katherine Speer, a fellow employee of the Rand Corp., in 1953. She died in 2004. He later married Ann Wheeler Smith, who died in 2017. No immediate family members survive.

Mr. Marshall in 1969. (Rand Corp.)
[HN01B6][GDrive]

For more than 40 years, Andrew W. Marshall presided over a little-known office deep in the bowels of the Pentagon as the Defense Department's designated deep thinker. A civilian scholar who had never served a day in uniform, he was charged with pondering the imponderable and with devising the country's long-range strategies for fighting — and surviving — future wars.

Follow the latest on Election 2020

Drawing on a variety of disciplines, from statistics and business management to nuclear physics, he was credited with foreseeing the collapse of the Soviet Union and with prodding reluctant U.S. leaders to adapt to changing military and technological needs.

Mr. Marshall, who guided the Defense Department's Office of Net Assessment for 42 years, had access to the nation's most sensitive intelligence secrets and worked directly for the secretary of defense. He was known for challenging established ways of thinking and for acquiring a reputation as the Pentagon's "Yoda," after the wise, gnomic Jedi master of "Star Wars."

"He had an uncanny ability to pick out only the most significant questions, then to drill down deeply," Michael Pillsbury, a colleague of 45 years, said in an interview. "He developed an iconoclastic, contrarian image."

Mr. Marshall inspired such loyalty and near-reverent devotion that his former staffers called themselves graduates of "St. Andrew's Prep." He was 97 when he died March 26 at a hospice facility in Arlington, Va.

The death was confirmed by Jeffrey McKitrick, a friend and former employee. He was present at Mr. Marshall's bedside when he died but said he could not cite a specific medical cause.

One reason Mr. Marshall was held in such esteem was his sheer longevity: **He had been studying U.S. military strategy since 1949, at the beginning of the Cold War, and retired at 93 in 2015. He worked for years at the Rand Corp., a California think tank associated with the military, and had witnessed nuclear explosions in the 1950s before coming to the White House in 1969 as an aide to then-National Security Adviser Henry Kissinger.**

In 1973, Secretary of Defense James R. Schlesinger, Mr. Marshall's onetime colleague at Rand, created the Office of Net Assessment and put Mr. Marshall in charge. (The term "net assessment" derived from studies of nuclear war, including estimates of casualties and damage.)

"We tend to look at not very happy futures," Mr. Marshall once told The Washington Post.

He brought an innovative approach to long-range military planning, including the use of business models of corporate competition to describe how powerful countries seek to gain geopolitical advantage over one another. He looked to history to see how advances in technology were reflected on the battlefield.

"What's amazing," he told the New Yorker in 2006, "is how much we know, it turns out, about the chariot revolution back in 1700 B.C."

He distributed more than $10 million each year in grants to think tanks, universities and defense contractors to imagine future conflicts, then devised "war games" to test hypothetical military strategies.

Mr. Marshall had a staff of only about 10 analysts, including military officers and civilians, working in windowless offices on the third floor of the Pentagon. They held the highest levels of security clearance.

"His approach was always to focus on the question," McKitrick, a defense researcher who worked for Mr. Marshall in the 1980s, said in an interview. "Too often, people focus on solutions but haven't identified the right questions. He thought it was very important to get the strategic questions right and then start thinking about the answers."

Mr. Marshall received intelligence reports from the CIA and Defense Department and gauged future military needs against what he learned about U.S. adversaries.

"One of the things that happens from time to time ," he told Armed Forces Journal in 2011, "is that you have to revise your entire notion of how your opponent sees things."

During the Cold War, the conventional Pentagon thinking was that a Soviet nuclear attack would be aimed at major cities.

"We assumed the Soviets were like us and that they would like to destroy our cities," Pillsbury said. "No, they wanted to destroy our command-and-control

systems," targeting military and political leaders.

As a result, billions of dollars were spent to strengthen emergency bunkers and to improve communications networks.

In the waning years of the Cold War, Mr. Marshall was among the first to suggest the Soviet Union's crumbling infrastructure and failing economy foretold the country's imminent collapse.

By then, Mr. Marshall had turned his attention in a different direction, following the adage that military leaders are always prepared to the fight the last war, not the next one. His view was that, as the world changed, the nature of warfare should change with it. In the 1990s, he recommended that military leaders shift their focus to China as the greatest long-term threat to U.S. preeminence.

In a 1993 memo called "Some Thoughts on Military Revolutions," Mr. Marshall called for a "revolution in military affairs," emphasizing a smaller, more mobile strike force and greater reliance on information technology. (Mr. Marshall did not use computers or email himself.)

During the administration of President George W. Bush, Defense Secretary Donald H. Rumsfeld called on Mr. Marshall to lead a comprehensive review of military readiness. Rumsfeld's recommendation of a smaller, nimbler military came directly out of Mr. Marshall's thinking.

Critics, however, noted that Mr. Marshall underestimated the social impact of the Internet and failed to anticipate the role of terrorism in the attacks of Sept. 11, 2001.

"You can never account for black swans, and 9/11 was a black swan," McKitrick said. "There is a difference between predictions and forecasting." Mr. Marshall, he added, "was about strategic forecasting."

Andrew Walter Marshall was born **Aug. 13, 1921**, in Detroit. His father was a stonemason, his mother a homemaker; both parents were immigrants from England.

As a child, Mr. Marshall was an eager reader with an interest in the military and history. He received a medical deferment during World War II because of a heart murmur and worked at an aircraft factory.

He attended Wayne State University in Detroit and, despite not having a bachelor's degree, was admitted to graduate school in economics at the University of Chicago, where he received a master's degree.

At the Rand Corp., his colleagues included futurist Herman Kahn — the best man at his wedding — and Daniel Ellsberg, who released the Pentagon Papers to news organizations, revealing the early history of the Vietnam War.

In those years, Mr. Marshall worked on early-warning systems and other ways to reduce the likelihood of nuclear attack.

His first wife, the former Mary Speer, died in 2004 after more than 50 years of marriage. His second wife, Ann Wheeler Smith, died in 2017. He had no immediate survivors.

Mr. Marshall was a political appointee who often expected that a change in administration would send him packing. (He never sold his house in California, expecting that eventuality.) In 1997, Defense Secretary William Cohen attempted to have him transferred out of the Pentagon, but the outcry was so strong that Mr. Marshall stayed put for another 18 years.

After he retired, Mr. Marshall continued to consult with military experts until a week before his death.

Mr. Marshall's office prepared more than 20 "net assessments" of future military strategies, each looking 10 to 20 years into the future. He delivered the reports by hand to the secretary of defense, carrying them in a zippered bag made of fireproof fabric. Only one copy was made of each report, which Mr. Marshall then kept locked in his office.

He is the only person known to have read all the reports, which remain classified to this day

Office of Net Assessment

The United States Department of Defense's **Office of Net Assessment**[1] (**ONA**) was created in 1973 by Richard Nixon to serve as the Pentagon's "internal think tank" that "looks 20 to 30 years into the military's future, often with the assistance of outside contractors, and produces reports on the results of its research".[2] The Director of Net Assessment is the principal staff assistant and advisor to the Secretary and Deputy Secretary of Defense on net assessment.[*clarification needed*]

According to Defense Directive 5111.11, the Director shall develop and coordinate net assessments of the standing, trends, and future prospects of U.S. military capabilities and military potential in comparison with those of other countries or groups of countries in order to identify emerging or future threats or opportunities for the United States.[3][4] Paul Bracken explains that it is important to have a good grasp of net assessment because it is an "important part of the language spoken by leaders in the higher levels of DOD" and officers who lack familiarity "will be at a disadvantage in communicating with the civilian leadership".[5]

Andrew Marshall was named its first director, a position he continued to hold under succeeding administrations.[6] In October 2014, Marshall announced plans to retire in January 2015.[7] He was replaced by Jim Baker in May 2015.[8][9]

Office of Net Assessment Directors[edit]

- Andrew Marshall, 1973 – January 2, 2015
- James H. Baker, May 14, 2015 – Present

Notable staff[edit]

Staff members have included:

- David S. Yost
- Andrew F. Krepinevich, Jr., formerly the president of the Center for Strategic and Budgetary Assessments
- Larry Seaquist, recently a member of Washington State's House of Representatives

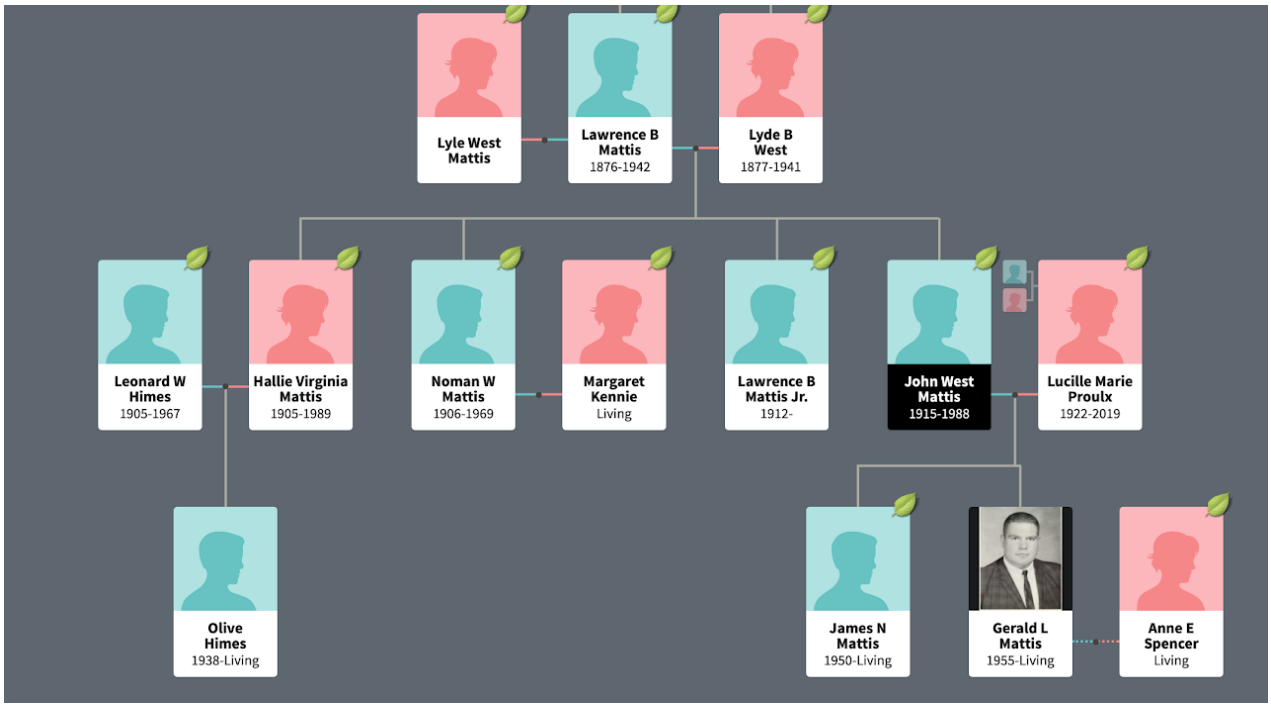
General James Norman Mattis (born 1950)

https://en.wikipedia.org/wiki/Jim_Mattis

Born Sept. 8, 1950 in Pullman, Washington to John West Mattis, a long distance merchant marine, and Lucille Marie Proulx, a WWII intelligence operative and later involved with the Atomic Energy Commiission.



John West Mattis met Lucille M. Proulx in 1945 onboard his ship as she was returning from South Africa at the end of the war. They then married in New York City. They moved to Washington State and John gave up the sea to work at the Hansard Nuclear site.

In recent research, we have seen merchant marines being close relatives of people we have been studying. Of more intrest is the wife/mother Lucille Proulx. She was born in Winnipeg, Manitoba. This immediately raises eyebrows as this has been the launching ground of British intelligence into the United States since the early 1900s. Sir William Stephenson, the OSS spymaster, was born in Winnipeg a generation earlier. The metadata suggests Sir William ran a British intelligence operation inside the USA long before WWII, and his quite possibly lived in Tennessee, where his wife is from.

Below is Lucille Proulx's obituary:

LUCILLE MARIE MATTIS of Richland passed away on August 4, 2019. She was born May 14, 1922 in St. Boniface (Winnipeg), Manitoba, Canada to Joseph and Eugenie Proulx. In 1923 th family emigrated to the Mesabi Iron Range in northern Minnesota where her father worked i the mines along with many other immigrants.

Lucille graduated from Horace Mann High School in Biwabik, Minnesota, in 1940. In 1941, aft attending nearby Evelyth Junior College for one year, she moved to Washington, D.C., where she went to work as a stenographer in the War Department as a civilian employee of Army Intelligence. In 1942, she moved to the newly completed Pentagon where among other tasks she typed up the plans for Operation Torch--the invasion of North Africa--America's first offensive campaign in the European Theater.

In 1943, she was assigned to the Office of the Military Attache at the U.S. Legation in Pretoria South Africa. She embarked from New York by ship along with other diplomatic personnel a a cargo of ammunition, was escorted by destroyers for the protection from German submarines to the Panama Canal, and then traveled down the west coast of South America, around Cape Horn and then to Capetown. En route she met one of the ship's mates, a Merchant Marine officer named West Mattis. When she left the ship in Capetown, they decide to write one another and after the war ended, they married in New York City on November 1 1945.

When West was transferred to a new homeport in San Francisco, Lucille worked for the Commonwealth Club of California in San Francisco until their son Tom was born in 1948. We subsequently left the Merchant Marine and in 1950, the family moved to Pullman, Washingt where he went to work at the Washington State College power plant. Son Jim was born in Pullman in 1950.

In 1952, the family moved to Richland when West went to work at the Hanford Site. Lucille worked variously for the US Army at Camp Hanford, the Richland School District and took time off to have a third son, Gerald, also born in Pullman in 1955. Lucille subsequently work for the Atomic Energy Commission and managed office services for Vitro Engineering, completing her career as a contracts officer with Washington Public Power Supply System.

Ian Robert Maxwell (born 1923)

Wikipedia Ian Robert Maxwell

1991 (Oct) - Obituary - NYTimes

See [HN00QK][GDrive]

Robert Maxwell, who died today after going overboard from his yacht off the Canary Islands, fled the collapse of Czechoslovakia in 1939 to become one of the most powerful publishers in Britain and the world, presiding over a multibillion-dollar empire he assembled with brass and bravura over 40 years.

An avowed socialist whose newspapers here supported the Labor Party, the 68-year-old publisher ran his businesses with legendary ruthlessness and attention to earnings, paring by the hundreds the staffs of the companies he acquired and instantly dismissing editors of his newspapers when they disagreed with him.

As a global businessman with interests in scores of countries, he borrowed money on a heroic scale, but kept his bankers, executives and staffs toeing the line by the power of his physical presence and his insistence on having his way.

Despite his physical size -- he was about 6 feet tall and weighed about 290 pounds -- Mr. Maxwell was compulsively active. With his beetling black eyebrows and his booming baritone, he had a talent for self-dramatization and knew how to skirt the edge of scandal. Even after taking large parts of his empire public this year, he kept his own financial affairs well hidden in a multinational web of holding companies, the most closely guarded of them a private family trust in Liechtenstein.

Once described by British Government fraud investigators as unsuited to run a public company, he lost his seat on the board of his first company, Pergamon Press, but eventually won it back. "I have never worried about what the Establishment believes about me or doesn't," he said a few years ago. "I don't give a damn."

5 Family Members Die in Auschwitz

This complex figure who sought and cultivated political and government connections in the Soviet Union, Eastern Europe and Israel as well as in the United States, was born on June 10, 1923, into a Hasidic family called Hoch in the Ruthenian village of Slatinske Doly, then part of Czechoslovakia and now in the Soviet Union, and was given the name Ludvik. He was selling trinkets on the streets of Bratislava in March 1939 when Hitler's allies in Hungary occupied his homeland as the Nazis marched into western Czechoslovakia.

His mother and four other members of his immediate family died in the Auschwitz concentration camp, and his father is believed to have been shot either there or during transport to the camp. Only two of Mr. Maxwell's sisters survived it.

Though Mr. Maxwell never made much of his religion, he was an outspoken supporter of Israel all his life. He escaped the Holocaust by making his way to France and joining a group of Czechoslovak volunteers in the French Foreign Legion in March 1940.

After the French defeat that year, he escaped again, being evacuated with other Czechoslovak troops to Britain. He later claimed he learned English in only six weeks. Soon after his arrival he joined the British Army as a volunteer and earned a battlefield commission as lieutenant. His talent for languages then led him into intelligence work.

It was on such an assignment to Paris, just after its liberation in July of 1944, that he met the woman who would become his wife, a French Huguenot named Elisabeth Meynard. Proposing to her in December, he promised that he would win a Military Cross, re-create a family, make a fortune, and become Prime Minister of England. "And I shall make you happy until the end of my days," he said.

The first promise, at least, he kept in 1945, winning the Military Cross for "heroism in the face of enemy action" at the Dutch-German border. When the war ended, he was discharged as captain, a title he insisted on using in civilian life for 20 years afterward. He also acquired his name, Ian Robert Maxwell, at the suggestion of a Scottish officer friend.

Company Is Lost In a Scandal

For the next two years he served in occupied Germany with the British Foreign Office as head of the press section in war-ravaged Berlin. There he would make business contacts that led to the purchase of his first company, a publisher of scientific journals and textbooks that he bought from its German and British owners and renamed Pergamon Press.

With a bank loan and money borrowed from his wife's family and from relatives in America, Mr. Maxwell built it into a thriving company by 1964, when he took a step toward fulfilling his political ambitions by winning a seat as a Labor Party Member of Parliament for the rural constituency of Buckingham, north of London.

His political and business fortunes took a turn for the worse in 1969, when he lost Pergamon in a financial scandal after trying to sell it to Saul P. Steinberg, the New York financier. Mr. Steinberg contended that Mr. Maxwell had misled him about the company's worth, and pulled out of the deal.

The principal shareholders then angrily ousted Mr. Maxwell from Pergamon's board. The next year, Labor lost the elections to the Conservatives, and, embroiled in the scandal, Mr. Maxwell lost his seat.

A protracted British Government investigation concluded in mid-1971 "that, notwithstanding Mr. Maxwell's acknowledged abilities and energy, he is not in our opinion a person who can be relied on to exercise proper stewardship of a publicly quoted company."

"Not true," Mr. Maxwell responded with fury. Ultimately he recovered, going heavily into debt to buy back Pergamon privately in 1974 after reaching an out-of-court financial settlement with Mr. Steinberg and his investment partners. He sold the company again to a Dutch publisher, Elseviers, last March for $:440 million ($770 million).

He would never again run for public office, but as a newspaper publisher --- one of the few, in the past decade, to back the Labor Party instead of the Conservatives -- he exercised another kind of political influence. He also helped revolutionize the newspaper business in Britain, ruthlessly eliminating the ancient practices of overstaffing and the overlapping jurisdictions that had given Fleet Street unions a stranglehold over management and allowing Conservative publishing rivals like Rupert Murdoch to follow his example.

Newspaper Payrolls Are Slashed

When Mr. Maxwell bought the British Printing and Communication Corporation in London in 1980, it was nearly bankrupt. He told the unions that the only way to save any jobs at all was to cut the payroll from 13,000 to 7,000 workers. Later, as Maxwell Communications Corporation, the company came to be regarded as a model of efficiency.

So, too, was Mirror Group Newspapers, which Mr. Maxwell acquired as a privately owned company in 1984. There he found typesetters earning more than assistant editors and many people working four-hour days and four-day weeks. His arrival as chairman came at 3 A.M. the morning after the sale.

Told that the entire staff of The Daily Mail and The Sunday Record in Glasgow was holding a meeting to decide whether to work for him, Mr. Maxwell replied, "If they don't return to work I will close down their papers and they won't open again."

"Forward with Britain," the Mirror proclaimed under his leadership, and it and its sister papers in Scotland increased their circulation from three million to nearly four million last year, though it fell this year by about 300,000. Mr. Maxwell sold 49 percent of Mirror Group Newspapers to the public this year for $:245.5 million ($421.8 million), more than twice what he had originally paid for them.

His editors would soon learn that having him as publisher was an entirely new experience. "When I fire someone it is like a thunderclap," he told Sebastian Faulks of The Independent, not one of the newspapers he owns, last year. "My primary duty is to hire and fire editors. I treat them like a field marshal."

Magnus Linklater, one editor who worked for him, said, "Balance is not something usually associated with Robert Maxwell." He had a habit, Mr. Linklater said, "of suddenly appearing out of the blue, and woe betide the person who is not at his desk and doing what he's expecting them to be doing."

Mr. Linklater was hired to run a new afternoon tabloid, The London Daily News, that Mr. Maxwell launched in 1987. Asked at the time by a reporter from another newspaper whether he would dismiss Mr. Linklater if he wrote editorials supporting the Conservative Prime Minister, Margaret Thatcher, instead of Labor's leader, Neil Kinnock, Mr. Maxwell paused briefly and then answered:

"He would have my permission to do so. I would have him certified. But he would certainly be able to do it."

Mr. Linklater survived, but the newspaper did not, and the flop cost Mr. Maxwell the equivalent of $50 million. Later, he said, "I made certain that never again would I launch a paper and leave it in the hands of the professionals."

A Weekly Paper For All of Europe

The publisher, who at the end claimed to be able to speak 11 languages, launched a European-wide English-language color weekly newspaper, The European, in May of last year. Visiting its offices one weekend and finding that he had no office in the newsroom, he took the nameplate off the door of the one used by its first editor, Ian Watson, and took over that room on the spot.

Last winter, he replaced Mr. Watson as editor, easing him upstairs to the board of directors. The weekly has reportedly lost money since its inception, and Mr. Maxwell kept it as part of his private business operations.

In recent years, he turned his business eye toward the United States, acquiring the publishing house of Macmillan in 1989 for $2.6 billion and Official Airline Guides for $750 million. The acquisitions came at a price of a heavy debt load that later forced him to sell Pergamon and part of the Mirror Group, but Mr. Maxwell's real interest soon became The Daily News in New York City, which he acquired from the Tribune Company of Chicago last spring, ending a long and costly strike from which the tabloid has not yet recovered.

Mr. Maxwell always insisted that The Daily News was "in danger of becoming profitable" by early next year, and promised to spend most of his time running it. At first, he did, parking the yacht that took him on his last voyage, the Lady Ghislaine, named after a daughter, in the East River off 30th Street and holding court. Hailed at first for saving two-thirds of the paper's jobs, he was made an honorary Grand Marshal at the Salute to Israel Parade on Fifth Avenue. But later he seemed to fade from public view and to spend more of his time in London.

To the members of the sedate British Establishment he said he despised, Mr. Maxwell was regarded as an upstart outsider, the piratical financier the satirical press weekly Private Eye called "Captain Bob." An American author, Seymour M. Hersh, contended in a recent book, "The Samson Option," that he had close ties with Israel's top leadership, and that Nicholas Davies, the foreign editor of The Daily Mirror, was buying and selling arms in partnership with an Israeli intelligence operative.

Mr. Davies denied the charge last month, but later, confronted with evidence that he had met an arms dealer in Ohio despite his denials, he acknowledged that he had not told the truth about the trip and The Mirror dismissed him. But Mr. Maxwell maintained his lawsuit against Mr. Hersh, who has filed a countersuit.

New Interests In Eastern Europe

Mr. Maxwell's critics have often made fun of the fawning biographies he published of Eastern European Communist leaders like Erich Honecker of East

Germany, Nicolae Ceausescu of Romania and Todor Zhivkov of Bulgaria.

After they fell, he pirouetted neatly around and acquired interests in newly democratic newspapers in Hungary and Eastern Germany, and last year formed a $250 million fund to invest in joint ventures in the region. Prime Minister John Major, paying tribute to him today, said he had offered useful advice at the time of the failed coup in Moscow last August.

Mr. Maxwell never took a car when a helicopter would do, and roared in and out of his London headquarters --called, naturally, Maxwell House -- by helicopter every day from the Headington Hill Hall estate he rented from the city authorities in Oxford.

An ardent soccer fan, he owned clubs in both Britain and Israel at various times, but controversy attended his every attempt to buy another one. Last year, he was said to be growing disillusioned with the sport in Britain, saying it "could not be in a sorrier state," and put his interests in four clubs on the market.

Mr. Maxwell is survived by his wife, three sons and four daughters. Two of the sons, Ian Robert Charles Maxwell, 35, and Kevin Francis Herbert Maxwell, 32, are directors of the publishing company. Another daughter died of leukemia in infancy, and another son, the eldest, died in 1968, seven years after an automobile accident.

Correction: November 8, 1991

The obituary of Robert Maxwell on Wednesday misidentified the afternoon newspaper he began in 1987. It was The London Evening News, not The London Daily News.

2006 (March 10) - Article in Independent

See [HM0005][GDrive]

Robert Maxwell was being investigated for war crimes and was to be interviewed by police just before he mysteriously drowned 15 years ago.

Revelations that Maxwell, a captain in the British Army, knew he faced a possible life sentence for murdering an unarmed German civilian in 1945 lend support to the theory that he took his own life in 1991.

A Metropolitan Police file released to The Independent under the Freedom of Information Act shows that, weeks before he died, detectives had begun questioning members of Maxwell's platoon and were preparing a case for the Crown Prosecution Service.

Maxwell would have been told about the inquiry and knew that, if found guilty, he would be the first Briton to be prosecuted for war crimes. The War Crimes Act 1991 was enacted just six months before Maxwell's body was found floating in the Atlantic on 5 November after disappearing from his yacht, the Lady Ghislane.

No one has been able to explain how he came to die. But the police file shows that, by that time, officers had been able to establish the location in Germany where Maxwell was alleged to have killed an unarmed civilian. The shooting, which is said to have happened on 2 April 1945, was first disclosed by Maxwell's authorised biographer, Joe Haines, in 1988. Maxwell is quoted in the book describing how he tried to capture a German town by threatening the population with a mortar bombardment, a tactic that had proved successful on a nearby village hours earlier.

In a letter to his wife, published in the book, Maxwell recounts how he asked some Germans to fetch the mayor. He ordered the mayor to go back to town and tell the soldiers defending it to surrender or face destruction. One hour later the mayor returned, saying the soldiers had agreed to his demands. "But as soon as we marched off a German tank opened fire on us," Maxwell wrote. "Luckily, he missed, so I shot the mayor and withdrew."

The Met's file says: "The reported circumstances of the shooting gave rise to an allegation of War Crimes. To some extent, the reporting of the shooting incident was confirmed by Mr Maxwell in an interview he gave in 1988 to the journalist Brian Walden [30th October 1988]."

But the police could do nothing until Parliament had enacted the war crimes legislation which had been specifically designed to prosecute Nazi war criminals living in this country.

It was only when a member of the public made a complaint under the new legislation that an official investigation could begin. Two officers from the Met's historic war crimes unit began tracing members of his platoon but had been unable to find a witness to the alleged shooting of the mayor.

Maxwell is presumed to have fallen overboard from Lady Ghislane, which was cruising off the Canary Islands. The official verdict was accidental drowning, though many people, including members of his own family, believe he took his own life. It did not emerge until after his death that he had plundered the Mirror Group pensions' funds to bail out his ailing media empire.

Shortly after he was buried in Jerusalem, the police passed the conclusions of their investigation to the Crown Prosecution Service. The file obtained under the Freedom of Information Act says "it was determined that the case could be progressed no further, and it was closed in March 1992". The file also shows that although a lot of work had gone into the case the police had not been able to find a reliable witness to corroborate the account in Haines's biography. They had also raised concerns about having to rely on the quotes attributed to Maxwell in the book. But Maxwell would not have known this and he may have felt that the net was closing.

Maxwell was immensely proud of his war record. He fought his way across Europe from the Normandy beaches to Berlin, winning the Military Cross in January 1945. He had a hatred for Germans that stemmed from his earlier life, most of his family in Czechoslovakia having been killed by the Nazis. Later in life, he was reported to have said that the two things he hated most were Germans and taxes.

FindAGrave.com

See [HL003K][GDrive]

Robert Maxwell was born Ján Ludvík Hyman Binyamin Hoch into a poor Yiddish-speaking orthodox Jewish family in the small town of Slatinské Doly (now Solotvino, Ukraine), in the easternmost province of (pre-World War II) Czechoslovakia. His parents were Mechel Hoch and Hannah Slomowitz. He had six siblings. ***In 1939, the area was reclaimed by Hungary. Most members of his family died in Auschwitz after Hungary was occupied in 1944, by its former ally, Nazi Germany, but he had already escaped to France. In Marseille he joined the Czechoslovak Army in exile in May 1940.***

After the defeat in France and the retreat to Great Britain, Maxwell took part in the protest against the leadership of the Czechoslovak Army, and with 500 other soldiers, he was transferred to the British Pioneer Corps, and later to the North Staffordshire Regiment in 1943. He was then involved in action across Europe, from the Normandy beaches to Berlin, and achieved the rank of sergeant. ***He gained a commission in 1945, and was promoted to captain. In January 1945, he received the Military Cross from Field Marshal Montgomery. Attached to the British Foreign Office, he served in Berlin during the next two years in the press section.***

In 1945, he married Elisabeth "Betty" Meynard; a French Protestant, with whom he had nine children, with the goal of "recreating the family he lost in the Holocaust". Five of his children were later employed within his companies. His three-year-old daughter Karine died of leukemia and his eldest son, Michael, was severely injured in 1961 (at the age of 15), after being driven home from a post-Christmas party when his driver fell asleep at the wheel. Michael never regained consciousness and died seven years later.

After the war he used various contacts in the Allied occupation authorities to go into business, becoming the British and United States distributor for Springer Verlag, a publisher of scientific books. In 1951 he bought three quarters of Butterworth-Springer, a minor publisher; the remaining quarter was held by the experienced scientific editor Paul Rosbaud. They changed the name of the company to Pergamon Press and rapidly built it into a major publishing house.

Elsewhere

Donald MacArthur

Donald Malcolm MacArthur, 57, president of Dynamac Corp. of Rockville, Md., died Nov. 27 at the Austin Airport in Texas.

He and his wife were returning to their home in Bethesda after spending a family Thanksgiving at the L.B.J. Ranch. Mrs. MacArthur is a daughter of the late Tony Taylor, who died two years ago, former owner of The Old Mexico Shop in Santa Fe. She also is a niece of Mrs. Lyndon B. Johnson.

Mr. MacArthur, who was well known in Washington and Scotland, was a scientist and businessman. In 1970 he founded the Dynamac Corp., which specializes in providing technical services in environmental and health sciences, engineering, and information management and computer systems. The company now has 12 offices and employs more than 500.

Mr. MacArthur was born Jan. 7, 1931, in Detroit, Mich., of Scottish parents who had emigrated from the Isle of Lewis in the Outer Hebrides to escape hard times. In 1933 the family returned to the Isle of Lewis.

Mr. MacArthur was raised in the village of Carloway, at the age of 8, was enrolled in the Nicholson Institute in Stornoway where he received his primary and secondary education. He was a scholarship student at St. Andrew's University and was awarded a bachelor of science with honors in 1954. He received a doctorate from Edinburgh University in 1957.

He returned to the United States in 1957 and joined the faculty of the University of Connecticut at Storrs. From 1958 to 1966, he was with Melpar Inc., where he developed the Life Science Laboratories and directed the Chemistry and Life Sciences Division. From 1966 to 1970 he was deputy director of research and engineering in the office of the secretary of defense.

Mr. MacArthur was a Fellow of the American Institute of Chemists and a member of the New York Academy of Sciences, the American Chemical Society, the American Association of the Advancement of Science and the National Association of Life Sciences and Industries.

He sometimes referred to himself as a foreigner in his native land. Although born in the United States he was a Gaelic-speaking Hebridean Scot who maintained strong ties with his ancestrial land. He visited Scotland frequently and was active in the alumni association at St. Andrew's University. He was secretary of the St. Andrew's Society of Washington, D.C.

Survivors include his wife, Diana MacArthur of Bethesda; two stepchildren, Alexander Tschursin of Santa Fe and Elizabeth Tschursin of Bethesda; his father, Donald John MacArthur of the Isle of Lewis, Scotland; two brothers, Angus MacArthur of Burlington, Ontario, Canada, and John MacArthur of Glasgow, Scotland; and two sisters, Catherine Stewart of Perth, Australia, and Christie Ann MacLeod of Thunder Bay, Ontario, Canada.

At the time of his death, Mr. MacArthur was involved in raising funds to build the Bethesda Nursing Home on the Isle of Lewis.

Steve Miera

A wake service will be conducted today for Steve Miera, 47, of Nashville, Tenn., and formerly of Española. Mr. Miera died Wednesday in Nashville.

Survivors include his mother, Lugarda Miera of Española; five sisters, Berlinda Martinez and JoAnn Miera, both of Española, Lourdes Apodaca and Pablita Esquibel of Fairview and Cordelia Mares of Albuquerque; and a brother, Priscilliano Miera of Albuquerque.

Wally Berger

Chem Club

Doctor Donald MacArthur, a research physical chemist at the Melpar Corporation, told the Chemistry Club about "high energy fuel cells and electrochemical devices" last Wednesday night, March 23.

Dr. MacArthur, 27, whose work, according to Chem Club president Bill Risen, is mostly classified, is doing research on guidance systems and solid state fuels for missiles. He received his PhD from the University of Edinburgh in 1957.

The club is going on a trip to the nuclear reactor at the Naval Research Laboratory on April 26, Mr. Risen said.

DIANA TAYLOR TSCHURSIN
— Hessler Studio

Diana Taylor Tschursin, Dr. MacArthur Will Wed

Antonio J. Taylor of Santa Fe announces the engagement of his daughter, Mrs. Diana Taylor Tschursin of Washington and New Mexico, to Dr. Donald Malcolm MacArthur of Washington and Stornoway, Scotland.

Mrs. Tschursin is the daughter of Mr. Taylor and Mrs. C. Noel Sibley of Marshall, Texas, and is the niece of Mrs. Lyndon B. Johnson. She attended the Shipley School at Bryn Mawr, Pa., and was graduated Phi Beta Kappa in economics at Vassar College in 1955. She is a vice president of the Thomas J. Deegan Company of New York City.

Dr. MacArthur is the son of Mr. and Mrs. Donald J. MacArthur of Scotland. He was graduated with a bachelor of science degree from St. Andrews University and graduated with a Ph.D. degree at the University of Edinburgh in 1957. He is the director of the Chemical and Biological Sciences Laboratories at Melpar, Inc. near Washington.

The couple plan a fall wedding.

Scientists Form Group for Johnson Campaign

Engineers Included in Committee That Plans Vote Drive at Grass-roots Level

BY ROBERT C. TOTH
Times National Science Correspondent

WASHINGTON — A committee of Scientists and Engineers for Johnson has been formed, it was announced here Wednesday.

The group is led by Dr. George B. Kistiakowsky, who was former President Dwight D. Eisenhower's science adviser, and Dr. Jerome B. Weisner, who was science adviser to the late President John. F. Kennedy.

Three Nobel Prize winners, a former president of the National Academy of Sciences, well known medical researchers and officials of the aerospace industry also were among the 42 organizing members of the committee.

The committee plans to mobilize "a vote drive at the grass-roots level" for the election of President Johnson. It hopes to enlist at least half of the 2 million scientists and engineers in the nation.

Termed 'Bipartisan'

Therefore, it differs from science committees for previous Presidential candidates who functioned as advisers rather than active workers. It thus represents a higher level of involvement by scientists in politics than in the past.

The committee called itself "bipartisan" and staff members said some of the members had been identified with Republican campaigns in the past.

The committee said it supports eight specific programs, some of which probably will become issues in the fall campaign.

These include a "balanced and rational defense policy, arms limitation consistent with national security . . . continued progress in space exploration, unqualified enforcement of the Civil Rights Act, and the rejection of extremism under any guise."

Local Branches Planned

The organization wants to set up 20 to 40 local chapters across the country, and will work in close co-operation with the National Citizens for Johnson, rather than the Democratic National Committee.

Members of the Scientists and Engineers for Johnson Committee "will comment through national media on science-related issues throughout the campaign," the announcement said.

No comparable group has been set up to support the Republican candidate, Sen. Barry Goldwater. A scientists panel did endorse Richard M. Nixon in 1960.

Among those on the science committee for President Johnson are two prominent Negroes, Dr. Rufus Clements, president of the University of Atlanta, and Dr. W. Montague Cobb, professor of anatomy at Howard University. Dr. Cobb also is president of the National Medical Assn., a primarily Negro association.

Nobel Recipients

The Nobel Prize winners are university professors: Dr. Owen Chamberlain and Dr. Harold Urey of the University of California, and Dr. Polykarp Kush of Columbia University.

Medical experts in the committee include Dr. Detlev W. Bronk, former president of the National Academy of Sciences and now president of Rockefeller Institute for Medical Research; Dr. Michael de Bakey, professor of surgery at Baylor University; Dr. Sidney Farber, director of the Children's Cancer Research Foundation in Boston, and Dr. Paul Dudley White, famed heart specialist who treated President Eisenhower.

Several university presidents are on the committee. These include Dr. Katharine McBride, president of Bryn Mawr; Dr. Kenneth S. Pitzer, president of Rice University, and Dr. Samuel M. Nabrit, president of Texas Southern University.

Aerospace Leaders

Top officials in aerospace and other industries on the committee include Clarence (Kelly) Johnson, vice president of Lockheed Aircraft Corp. and designer of the A-11 and U-2 aircraft; George S. Trimble Jr., vice president of the Martin Co.; Richard E. Horner, vice president of Northrop Corp.; Dr. Chauncey Starr, vice president of North American Aviation, Inc., and Dan A. Kimball, chairman of the board of Aerojet-General Corp.

The committee was formed in 10 days by two young scientists. Dr. Donald M. MacArthur, a chemist, got the original idea, he said, and has been helped by Rodney W. Nichols, a physicist. Both are members of its staff now.

Anthony Taylor Represents President Johnson At Mrs. Mesta's Party

Anthony Taylor, Santa Fe Democrat, and brother of Lady Bird Johnson, represented the President and Mrs. Johnson at a gala Perle Mesta party in Atlantic City's Claridge Hotel on the last night of the Democratic convention.

Attending the convention as a delegate from New Mexico, Taylor carried to Mrs. Mesta's fiesta—the fifth given in honor of her longtime friend Lyndon Johnson that week — the first family's regrets that they could not attend in person.

He was accompanied by his daughter and her husband, Dr. and Mrs. Donald MacArthur of Washington.

Taylor, in his courtly manner, expressed the appreciation of both the President and the First Lady for all Mrs. Mesta had done for the Democratic party.

The President and his family were gathered with more than 1000 other guests in Convention Hall's upstairs ballroom, celebrating—among other things—his 56th birthday with Sen. and Mrs. Hubert Humphrey, comedian Danny Thomas, a 350-pound cake and a gigantic fireworks display.

Scientist Group For Johnson Organized Here

The newly organized Scientists and Engineers for Johnson and Humphrey raised approximately $600 the past weekend in campaign funds and named a temporary chairman.

Dr. Donald MacArthur, of Washington, was here to launch the statewide link to the national group.

Dr. MacArthur and his wife, the former Diane Taylor of Santa Fe, niece of President and Mrs. Lyndon B. Johnson, departed early Monday for Dallas to continue organizing a coast-to-coast network of organizations of technical people for the Democratic nominees.

Temporary Chairman Named

Dr. MacArthur met with some 40 persons — all technical and scientists — Sunday at the home of Dr. Sidney Solomon, 2406 Morrow NE. Leo A. Dunn, of Sandia Corp., was named temporary chairman.

Dr. Julius R. Blum, of the University of New Mexico, will serve as temporary treasurer and Victor J. Goetz, with ACF Industries, Inc., acts as publicity chairman.

Another meeting of the newly formed group is planned for 7:30 p.m. tonight at the First National Bank Bldg. East.

Seek Big Victory

Dr. MacArthur said the technical and scientists are organizing " . . . to make sure of an overwhelming victory for Johnson and Humphrey.

Albuquerque will serve as state headquarters. Plans include forming at least one group in each state.

The meeting here was preceded by similar sessions at Santa Fe and Los Alamos.

A top speaker in the scientific - technical community is expected to address the group before the Nov. 3 election.

NATIONAL SCIENTISTS-ENGINEERS FOR LBJ: Dr. and Mrs. Donald M. MacArthur, of Washington, look over political material prepared specially for Scientists and Engineers for Johnson and Humphrey while standing just outside their national headquarters in Washington. Dr. MacArthur and his wife, the former Diane Taylor, of Santa Fe, were in New Mexico Saturday and Sunday. (UPI Teltphoto)

Professionals Emerge as Political Force

Washington—Scientists and engineers are adding a new dimension to the art of politics by involving themselves to an unprecedented extent in this presidential campaign.

The experience of the Scientists and Engineers for Johnson citizens group shows that there is considerable unexploited political capital in the scientific community. The capital is in the form of providing prestigious names for window dressing, money for the campaign and volunteer work ranging from speech writing to phone calling.

Scientists and Engineers for Johnson got started earliest and appears to be having the most success, although Sen. Barry Goldwater (R-Ariz.) is organizing a counterpart group (see box). The Johnson group claims to have chapters in 35 states and estimates it will have raised $200,000 by election day.

Rodney W. Nichols in July took leave from his job as head of a systems analysis research group at Melpar, Inc., Falls Church, Va., to help organize Scientists and Engineers for Johnson. He was joined by an associate at the firm, Dr. Donald MacArthur, manager of the life sciences research center. Nichols said he wanted to do something to help defeat Goldwater while MacArthur received an extra push into the campaign from his wife, the former Diana Taylor, a niece of the President's wife. Nichols, 27, is now staff director and MacArthur, 33, executive director of the group.

"We decided at the outset that our group would only be meaningful if it was a vote getting mechanism, not another brain trust," Nichols said. This is what they set out to do, with some professional advice and encouragement from the man President Johnson had put in charge of such citizens groups, James Rowe. They also had as a guide the campaign handbook compiled by Lawrence F. O'Brien, the late President Kennedy's campaign director and now President Johnson's. "We found the handbook very 'commonsensical,'" Nichols said.

First step was to thumb through the various directories of people in the scientific and engineering fields and compile a list of recognized leaders who might be persuaded to join the committee and help expand its membership.

Nichols said the basic sales point in getting those first members went this way: "You may have been apolitical all your life, but this November the issues to be decided are so vital and so basic that we don't believe anybody can afford to be neutral." Usually, Nichols said the committee got a commitment.

He concedes this would not have been as easy if the presidential candidates were not as opposed in viewpoints. "We are exploiting the peculiar polarized character of this campaign." He said many members of the scientific community were looking for a way to become involved in the campaign, "so we're probably riding a trend."

Charter members who helped recruit others in their fields for the committee include Richard E. Horner, Northrop Corp. vice president; C. L. (Kelly) Johnson, Lockheed vice president who designed the YF-12A (A-11); Dan A. Kimball, Aerojet General Corp. board chairman and a former Navy secretary; Dr. Jerome Wiesner, President Kennedy's science advisor (AW&ST Sept. 14, p. 25); C. R. Able, vice president and general manager of the Missile & Space Systems Div. of Douglas Aircraft Co.; Charles D. Perrine, Jr., executive vice president of General Dynamics/Pomona; Finn Larsen, a vice president of Honeywell, Inc.; and Herbert F. York, director of Defense Research and Engineering during the Eisenhower Administration, have joined since then.

Just how deeply involved some members of the scientific community are willing to get was evidenced by Dr. Stanley Klein, clinical psychologist at a children's psychiatric hospital in Boston. He reported to the National Head quarters here last August, announced he was spending his vacation there and went to work. He made speeches, recruited volunteer workers for the committee from nearby colleges and handed out literature at the Convention.

There were many from the scientific community who were reluctant to join such a political action committee. Nichols said a lot of these were won over by having someone in their own field call and persuade them to join. One aerospace executive on the committee would call another who was not, a member college dean would call one of his counterparts, etc.

Nichols said one lesson learned in this recruiting was that medical doctors displeased with the American Medical Assn. usually welcomed the chance to join a political action group of professionals. "It provides them with an umbrella of legitimacy," he said because Scientists and Engineers for Johnson is not a competing medical group subject to attack by the AMA. The doctors are contributing time and money—prime requisites for a successful campaign.

Nichols said the committee to date has collected about $50,000. Although most of the money came from individuals, the Democratic President's Club donated $12,000 to help start the group. Sizable contributions from individuals included one of $3,000 from Thomas J. Watson, Jr., board chairman of International Business Machines. The committee expected to raise additional money at a rally in Washington Oct. 11 when Democratic vice presidential candidate Hubert Humphrey was scheduled to speak on "Science and Technology in the Great Society."

Committee expenses so far have ranged from paying a New York public relations man, David L. Garth, $1,000 a week for four weeks for helping organize state chapters to buying directories of those in the science and engineering professions. There also were the usual bills for campaign literature.

Nichols predicts scientists, engineers, doctors and other professionals will participate more fully in future political campaigns, both national and state.

President Johnson stated the case for more involvement of the scientific community in politics. He told the National Space Club Mar. 22, 1963: "We are at a point in our national history in which the future capabilities of our country—and the future of our country's role as a leader of freedom—depend decisively on both mutual understanding and mutual trust, as well as mutual comprehension, between the community of technology and the community of public affairs."

GOP Task Force

Washington—Sen. Barry Goldwater (R-Ariz.) has formed an advisory Task Force on Space, Science and the Atom headed by Lewis L. Strauss, former chairman of the Atomic Energy Commission. Sen. Goldwater said he wanted the panel to provide him with "a sharper definition of the issues."

Other members of the panel are USAF Gen. James H. Doolittle (ret.), chairman of the National Citizens for Goldwater-Miller Committee and former member of the President's Science Advisory Committee in 1957; Dr. John H. Lawrence, Donner Laboratory director at the University of California; Dr. Willard F. Libby, former member of the AEC and now a chemistry professor at the same school; Dr. Edward Teller, physicist who advocates development of big nuclear bombs and who opposed the test ban treaty; Gen. Arthur Trudeau (ret.), chief of Army research and development 1958-62 and now president of Gulf Research and Development Corp.; and Dr. Shields Warren, Harvard medical school professor and AEC consultant.

THE ALTERNATIVE IS FRIGHTENING

JOHNSON/HUMPHREY

MUST BE ELECTED

WE SUPPORT:

A balanced and rational defense policy.

Arms limitations consistent with the national security.

Continued efforts toward lessening of international tensions.

Continued advancement in medical and other scientific research areas.

Uninterrupted growth in the number and quality of educational opportunities available to all citizens.

Expanded federal action on the application of science and technology to the social and economic problems of our time.

Unqualified support and enforcement of the Civil Rights Act.

1964 - Detailed recollection of Dr. Donald MacArthur working to defect election of Goldwater

"Science, Money, and Politics: Political Triumph and Ethical Erosion" by Daniel S. Greenberg

Each year, Congress appropriates billions of dollars for scientific research. In this book, veteran science reporter Daniel S. Greenberg takes us behind closed doors to show us who gets it, and why. What he reveals is startling: an overlooked world of false claims, pork, and cronyism, where science, money, and politics all manipulate one another.

PAGE TEN — Section Three — FORT WORTH S

LBJ Clan Members Share His Triumph

BY JOHN MORT
Star-Telegram Washington Bureau

WASHINGTON, Jan. 20—President Johnson's Texas kin shared in his moment of glory Wednesday.

Numerous relatives of both the President and his First Lady occupied seats of honor among some of the nation's leading dignitaries at the inaugural ceremony.

Seated in the first row on the inaugural platform were Mrs. Johnson and their daughters, Lynda and Luci, with the First Lady placed immediately to her husband's right.

Other front - row occupants were the President's sister, Mrs. Birge Alexander of Fort Worth, her husband and their daughter, Becky, a University of Texas student; Mrs. Johnson's brother, A. J. Taylor of Santa Fe, N. M., and his wife; and two of the President's aunts, Mrs. Jessie Hatcher and Mrs. W. E. Saunders.

In the second row, seated next to U. S. Chief Justice Earl Warren, were Gov. John Connally, long-time Johnson intimate, and Mrs. Connally.

In the same row were Johnson's sister, Mrs. O. P. Bobbitt of Austin, and her husband; his brother, Sam Houston Johnson, also of Austin; and the Taylors' daughter, Mrs. Donald MacArthur of Washington.

Mrs. Johnson's sister-in-law, Mrs. T. J. Taylor Jr., and her daughter, Susan, were assigned third-row seats, along with two of the President's nephews, Phillip Bobbitt and Rodney White.

An uncle of the President, Huffman Baines Sr. of San Antonio, was in the fourth row, along with members of the cabinet.

Also on the presidential platform were Dale Miller of Dallas, chairman of this year's inauguration committee, and his wife.

The family of Vice President Hubert Humphrey also was well represented on the platform.

Mrs. Humphrey sat next to Mrs. Johnson, between the First Lady and the Johnson daughters.

Seated elsewhere on the platform were the Humphrey sons, Hubert H. III, Robert and Douglas; the daughter, Mrs. Bruce Salomson; and Humphrey's brother, Ralph, and his sister, Mrs. Frances Howard.

B2 THE NEW MEXICAN Santa Fe, N.M., Sunday, May 9, 1965

MRS. DIANA TAYLOR MacARTHUR

SF Woman To Head Peace Corps Relations

Peace Corps Director Sargent Shriver has announced the appointment of Mrs. Diana Taylor MacArthur of Santa Fe, to head the Division of Private and International Organizations.

This division coordinates the relations of the Peace Corps with various organizations which cooperate in many of its programs and help to promote an understanding of its objectives.

Mrs. MacArthur is not new to the Peace Corps. Beginning in February 1963, she served first as deputy chief of the West Africa division and then as regional program officer for North Africa, Near East and South Asia. She also helped to prepare for the recent conference of returned volunteers.

"I was greatly inspired by the call to duty which President Kennedy sounded when he proposed the Peace Corps," Mrs. MacArthur said, "and this is something I want very much to do. I would like to have joined when I got out of college, but this is about the closest I can come now as an adult with a home and family to serving in a way which I would have chosen earlier, had there been a Peace Corps."

Prior to joining the Peace Corps, Mrs. MacArthur was vice president in charge of the Washington office of Thomas J. Deegan Company, New York public relations firm. From 1957 to 1961, she was a consulting economist for the firm of Checchi and Co., Washington, D.C. She is a member of the National Board of the Girl Scouts of America.

Mrs. MacArthur attended Vassar College from 1951 to 1955, majoring in economics and graduating Phi Beta Kappa. Her junior year was spent at the University of Geneva and Graduate School of International Studies, Geneva. She lived in France in 1950 under a scholarship from American Field Service, Experiment in International Living.

Mrs. MacArthur is married to Dr. Donald Malcolm MacArthur, scientist for a Washington industrial firm. They have a daughter Lisa, 10, and a son, Alex, 8.

AS OUR COLUMNISTS SEE IT

THE PHILADELPHIA INQUIRER, WEDNESDAY MORNING, AUGUST 4, 1965 h 27

Ruth Montgomery

Johnson Kinfolk Make News in Government Jobs

WASHINGTON.

SOME of President Johnson's kinfolk have been making headlines recently through their jobs with the Federal Government. Most of them could doubtless have done just dandy, even without an illustrious kinsman in the White House, but their appointments or promotions would not have been so newsworthy in that event.

LBJ's brother-in-law, Antonio J. Taylor, has just returned from a four weeks' mission to Latin America, where he served as a $75-a-day consultant to Agency for International Development officials on developing outlets for native handicrafts.

Lady Bird's only living brother has for the past 37 years been operating an import handicraft store in Santa Fe, N. M., and when President Johnson flew out West to meet the President of Mexico last year, he invited his Spanish-speaking brother-in-law to go along.

Tony Taylor's married daughter, Diana MacArthur, was appointed three months ago to head the Division of Private and International Organizations for the Peace Corps.

• • •

FORMERLY a vice president in charge of the Washington office of Thomas J. Deegan Associates, a New York public relations firm, Mrs. Donald Malcolm MacArthur switched to the Peace Corps while her uncle was Vice President, in February of 1963. A highly capable woman, she served as a deputy in charge of the West Africa division and as a regional programmer for the Peace Corps' North Africa division and as a regional programmer for the Peace Corps' North Africa, Near East and South African office before her recent promotion.

Another Presidential brother-in-law, Birge D. Alexander, has just been named to head a new Southwest area office of the Federal Aviation Agency. The 55-year-old husband of LBJ's sister could probably have made this step-up on his own, however, since he holds two bachelor of science degrees in mathematics and civil engineering from Southwest Texas State Teachers' College and the University of Texas, and has been with the FAA for many years.

A distaff Presidential cousin, Patsy Derby, works at the White House as one of Lady Bird's secretaries, and also accompanies 18-year-old Luci on visits to Volunteers for Vision projects, to Milwaukee for 4-H club appearances, and the like. Patsy's grandmother and Lady Bird's father, Thomas Jefferson Taylor, were brother and sister.

• • •

PRESIDENT Johnson will have a long way to go, however, to equal the kissin' kin record set by the Kennedy clan during the previous administration. The late President broke all precedents by naming his brother Bobby as Attorney General in the Cabinet, and his brother-in-law Sargent Shriver director of the Peace Corps.

JFK also placed another brother-in-law, Stephen Smith, in the State Department, and subsequently in a top spot at the Democratic National Committee; and he helped to elect his youngest brother, Teddy, to the Senate from Massachusetts.

The Texas drawl which has replaced the Boston twang in high circles is due far less to Presidential relatives than close friends. Scores of Lone Star Staters have been tapped by the magic wand, and their glittering jobs run the gamut from top White House advisory posts to chief of protocol and ambassador-designate to Australia.

All are bright, energetic and hard working, although most of them had no previous experience in government or diplomacy. The President's closest Congressional friend, Rep. Homer Thornberry of Texas, won appointment to the Federal bench in Texas through LBJ's intercession while Vice President, and has now been upped to a higher court.

OTHER long-time Johnsonian friends are also being tapped for exalted spots. The President's personal attorney, Abe Fortas, has been named to the Supreme Court, and the Johnson family's TV-radio lawyer, Leonard Marks, newly heads the United States Information Agency.

Precedent for this, too, was established by President Kennedy, who brought into government so many friends and advisers from Boston that they became known as the Irish Mafia. In President Truman's day, the cronies whom he brought to the seat of power were inelegantly known as the Missouri Gang, perhaps because President Harding's clique had been called the Ohio Gang.

All of which goes to show that there's nothing new under the sun.

Mr. And Mrs. Tony Taylor Welcomed In Madrid

Visiting in Madrid, Spain, this week, their first stop on a round-the-world flight, are Mr and Mrs. Tony Taylor.

The local couple spent several days in Washington enroute. While in the Capital, they were houseguests at the White House and attended the State of the Union Message occupying "front row" seats by invitation of his sister, Mrs. Johnson. They also spent time with their daughter, Mrs. Donald MacArthur and her family in nearby Maryland.

Officials of the Spanish Foreign Affice received the pair in Madrid where Santa Fe's Honorary Vice Consul of Spain Don Antonio Taylor conferred with his Spanish "colleagues."

Numerous festivities have been tendered the Taylors during their stay in the Spanish city. Among those honoring them was Miss Nini Montian (Marquesa Ampudia y de Montilla), Spanish chairman of the annual American - Madrid Debutante Ball, who complimented Mrs. Taylor, a member of the Ball's International Committee.

Mr. Taylor will fly from Madrid to Jordan on a government mission with the Agency for International Development program. Mrs. Taylor plans to tour Spain and Italy on a combined business - and - pleasure trip before joining her husband in the Holy Land.

From Jordan they will fly to India and the Far East for their first look at that side of the world and will return via Honolulu and the Pacific Coast.

Contrary to radio and television newscast reports, Mrs. Taylor's expenses are not being paid by the Government and his only during the period he is in Jordan as a consultant.

Dr. MacArthur Gets New Deputy DDRE (C&M) Post

Transfer of the Office of Director of Defense Technical Information from the Deputy Director of Defense Research and Engineering (Administration and Management) to the Deputy Director (Chemistry and Materials) is part of a recent DDR&E realignment.

Appointment of Dr. Donald M. MacArthur as Deputy Director (Chemistry and Materials), a recently created position, makes him one of the youngest scientific managers in the Department of Defense. Until installed in his new office, he had served since 1958 as a senior chemist with Melpar, Inc.

In addition to his responsibility for the Office of Director of Defense Technical Information, formerly under the Deputy Director (Administration and Management), Dr. MacArthur is charged with technical review and evaluation of all Defense research and development in the fields of chemistry and materials.

Responsibility for chemistry and materials formerly was assigned to the Deputy Director (Research and Technology), Dr. Chalmers W. Sherwin, who is now charged with management of in-house laboratories and the research program of the Deputy Director of Defense Research and Engineering.

Dr. MacArthur was manager of the Melpar, Inc. Chemistry and Life Sciences Center before the DDDR&E appointment. Educated in Scotland, he received a BS degree in 1950 from St. Andrews University and a PhD degree in physical chemistry from Edinburgh University in 1957.

Dr. Donald M. MacArthur

Scientists Convene to Fathom 'Ice Islands'

Arctic research conducted from floating "ice island" stations was discussed by about 100 scientists and engineers at a recent 3-day symposium sponsored by the Office of Naval Research and the Arctic Institute of North America, the ONR contract agency.

Participants were representative of the U.S. Armed Forces, other Federal agencies, private industry and academic research organizations in the United States, Canada and Japan. The symposium was held at Airlie House, Warrenton, Va., and was highlighted by some 30 technical presentations.

Travel To Capitol, Great Society Style

By SARAH McCLENDON
Times Washington Correspondent

Washington.—Here's how travel is some times arranged in the Great Society, so that persons who otherwise might not be able to afford a trip to Washington to attend one of those national conferences with the sponsorship of the White House may suddenly get a ticket and some times have hotel bills and meals all paid for.

Asked about reports of her personal solicitation of funds from big business for delegates' transportation expenses to the recent National Youth Conference on Natural Beauty and Conservation, Mrs. Diana MacArthur, niece of Mrs. Lyndon B. Johnson, told how she amassed $250,000.

Mrs. MacArthur said she told the firms which she was soliciting that their contribution would be made to the conference but their checks should be made out to the Girl Scouts of America, which was the organization that had been given the responsibility for management of this conference. The GSA was one of the cooperating organizations. Mrs. MacArthur said she was serving in this effort while on annual leave from her regular job as director of the Division of Private and International Organizations for the Peace Corps. She said she collected the funds as a member of the national public relations committee of the Girl Scouts. She is extremely interested in this organization and in youth. She has a daughter in the GSA and a son in Boy Scouts.

The conference fitted into the campaign for beauty and conservation which Mrs. Johnson as First Lady of the Land has been conducting with widespread results throughout the nation.

Mrs. MacArthur said the firms from which she collected could charge their contribution off in compiling income taxes. At least one of those firms, U.S. Steel Corp., when contacted about this, said they had not yet determined if they could charge this off.

Who asked you to pay part of the travel expenses of delegates to the conference?" an official of the corporation was asked.

"Mrs. Diana MacArthur," he replied.

"Did you know who she was?"

"Of course we did," he rejoined.

Other firms in the big business world from whom Mrs. MacArthur obtained funds for this purpose were, according to her, Campbell Soup, Coca Cola, Eastman Kodak, Hoover Foundation (Hoover vacuum cleaners), Texaco Inc., Zerox Corp.

Several of these firms have contracts with the Department of Defense where Mrs. MacArthur, is deputy director of Defense Research and Engineering for Chemistry and Materials.

Dr. and Mrs. Donald MacArthur together organized scientists and engineers for Johnson during the last presidential campaign.

ONE PLANT WATCHED

Mrs. MacArthur said that part of the money she collected went to pay for delegates' transportation and part for the salary of a coordinator. Some of the money which was left over from the conference will go to pay the salary of another coordinator who will soon start on her duties in carrying out the purposes of the conference.

U.S. Steel Corp., as a defense contractor, has been singled out as an example by the National Association for the Advancement of Colored People, which is making its Fairfield plant in Birmingham, Ala., a site of constant vigilance in the field of civil rights compliance, according to U.S. Steel officials.

Other large corporations recently helped defray the expenses for impoverished delegates and others to attend the White House Conference, "To Fulfill These Rights," held here June 1 and 2. There many of the delegates to the civil rights conference, whose bills at the Sheraton Park Hotel in Washington were paid, merely signed their names to the bill on leaving. Several contacted then said they did pay $25 for meals.

Among the big firms contributing to those costs were Textron, International Business Machines, Lockheed, Time, Inc.

Not all of the contributions came from management alone. United Steel Workers and the AFL-CIO also contributed.

Lausche Charges "Lop-Side Assignment" Of Science Grants Is Eroding Economy

By Medill News Service

WASHINGTON — Universities in some sections of the country are producing scientists in large numbers, only to have them "emmigrate" to areas where federal grants for research are heavily concentrated.

And Sen. Frank Lausche (D - Ohio) wants something done about it.

He says "the lop - sided assignment" of these federal grants is "eroding the economy of many states that aren't receiving these projects."

Lausche appeared before a Senate subcommittee which is investigating the procedure of federal agencies in assigning research money. The subcommittee heard testimony from officials of the Defense, Health Education and Welfare, and Agriculture Departments and the Atomic Energy Commission, all large flanaclers of research.

The officials all said that their departments were working to implement a Presidential directive which ordered the development of plans for a better geographical distribution of research funds. Most funds now go to large universities in the East and on the West Coast.

* * *

DR. DONALD MACARTHUR, deputy director of research and technology in the Defense Department, outlined his department's plan for a new $0.5 million program to develop "centers of excellence" in schools which now do not receive much Defense research money.

MacArthur said that inequality in the grants rests "upon an unequal development of graduate research facilities in the nation, and that it is in our interest, within the Defense Department, to provide some special attention toward equalization."

He said that to become "a center of excellence" for research, a school must attract a talented faculty. The new program would provide about $200,000 as an initial grant to start building up a faculty.

Chairman Glenn Seaborg of the Atomic Energy Commission said that the Commission's research program involved a few large laboratories which could not easily be set up in all parts of the country.

But, Seaborg said, "we have for many years, encouraged the use of these laboratories as regional and national research centers."

He said the Argonne, Ill., and Oak Ridge, Tenn., laboratories bring in graduate and undergraduate students from colleges in their areas. He said this program has lead to strengthened programs of research in 481 colleges and universities in all parts of the nation.

* * *

THE DIRECTOR of the National Institute of Health, Dr. James A. Shannon, said he did not think much would be gained "by a simple sharing of the wealth of science support" on a geographical formula basis.

"I do not believe any program or plan of support is reasonable as a federal action in the science field unless it requires as a counterpart a deep local commitment to excellence," Shannon said.

Sen. Carl Curtis (R - Neb.) said that many institutions in the Midwest and West have not received a "fair share" of research money because "Congress has not put agencies in a position of courage and risk in granting research contracts.

"If the contractor fails, it's the neck of the man who awarded the contract to the small school. But is he had awarded it to a big school, or to some company like General Electric, they would have said something was wrong with the project," Curtis said.

BETTY BEALE'S WASHINGTON LETTER

Expert Job by Chuck Robb on Honeymoon Secrecy

Washington, D. C.
Jan. 6, 1968

Dear News-Press Readers:

Chuck Robb shouldn't be heading for an overt war; he should join the covert part of the CIA. He's new to the goldfish bowl life, but he pulled off the greatest coup of any publicized bridegroom in recent memory.

He managed to cloak himself and his bride in a cloud of secrecy that must be the envy of everybody from Jacqueline Kennedy and Princess Margaret to Charles Lindbergh.

Despite reports that they honeymooned at Caneel Bay, V. I., to this day not even the First Lady is sure they did, and she is not the kind to ask. It's a cinch the President doesn't know either because he would be the first to tell, said a White House staffer with a chuckle.

Press Corps Alerted

And Chuck pulled this off at a time when the press corps all the way from the White House to the Caribbean, from Dulles Airport to Honolulu, was alerted to be on the lookout.

Yet not a single camera though equipped with telescopic lens and trained around the clock on the suspected honeymoon spot ever caught visible proof of the newlyweds' arrival,

Ambassador Jimmy Symington, chief of protocol, wowed his audience in the Shoreham Hotel's Blue room when he put on a fund-raising performance. A preview photo shows him with Mrs. Donald MacArthur, the First Lady's niece, and Warren Woodward.

wouldn't tell them when they looked at their social calendars.

The Middle East war, an earthquake and absences from town caused the swingingest diplomatic hostesses, the chatelaines of the Kuwait, Venezuelan, Spanish and Moroccan Embassies, to forego the usual

The Peabodys are now residents of Washington, but she recalled the time she was scheduled to be the main speaker at a B'nai B'rith dinner in Boston and canceled out the same day because her daughter had just come home from school and wanted very much to talk over

was nervous," he told them, "and I said 'Why should a col of protochief be nervous?"

Before singing "Shadow of Your Smile," he observed that there were many kinds of smiles.

"There is the kind you get when you call a king 'your royal highness;' or the kind you get when you step on the foot of a president as he is getting out of his car."

• • •

AROUND THE TOWN:

Sen. Joseph Clark's divorced wife of 32 years will marry a Washington socialite realtor in a couple of months. The Pennsylvania legislator who instigated the divorce remarried as soon as it was final.

Noel Clark, daughter of Mrs. William Hall of Louisville, Ky., and Easthampton, L. I., will wed Cuthbert Train, widower and son of the late Adm. and Mrs. Charles Russell Train. He has a post-debutante daughter and three sons. She has one married daughter.

Marjorie Post sent Mrs. Johnson a check for $10,000 made out to the Society for a More Beautiful Capital on Christmas eve. She had given an earlier check for $5,000 for the landscaping of a public school in a poor part of town.

What do you send a woman who has everything? To thank her the First Lady dispatched to the General Foods heiress' palatial residence on Christmas

day a basket of homey personal things such as loaves of bread baked at the White House, jars of peach and pear preserve put up at the LBJ Ranch, and a handwritten note.

CIA Director Dick Helms'

presence or departure. Jackie and Princess Margaret should seek his advice the next time they want to go off swimming somewhere in privacy.

How did he do it? He won't say.

"About 75 per cent of what we saw in print was amusing but not necessarily factual," he said. So the true story may never be known.

Said Lynda, regarding their first stop after leaving the White House, "I didn't know where we were going until we actually got there." Incidentally, they did not spend their wedding night at the Georgetown Inn as definitely stated in one paper.

An Early Riser

Lynda Robb, new Arlington resident, found out what it was like to be the dutiful wife of a marine officer even before she left the White House.

Her husband, she discovered during the two weeks they spent at the Executive Mansion after returning from their honeymoon, got up at 6:30 in the morning on work days.

"I think 8 a. m. is early!" exclaimed the President's daughter who, despite the fact that she was still surrounded by servants, arose in time to fix Chuck a real morning meal.

* * *

Washington had its quietest holiday season in years. A lot of chic people thought they must be slipping socially or had something their best friends ball on New Year's eve.

And there was even a new trend observed among the debutante set. The withdrawal from the exclusive Washington Debutante Ball of two girls whose parents had already paid $700 each for their participation and could not get their money back, is an indication of it.

Prefer to Travel

More and more prospective debutantes would rather have the money to go to Europe than have a coming out party. A lot would rather spend their vacation time at a ski resort where some of the most attractive stags are going. Many times it's the parents who nostagically are holding onto the traditional custom of presenting their daughters to society.

Even they skipped giving the usual holiday bashes for their contemporaries and spent their time instead keeping tabs on their gallivanting offspring—the reason being, the new morals among the young and the incredible crime on the streets.

Mrs. Endicott Peabody, the attractive wife of the former Governor of Massachusetts, says there would be a lot fewer hippies if parents were always there when their children needed them most.

Received an Award

Children, she thinks, "are desperately looking for someone who cares. And if they don't get the care at home they turn to love-ins and all the other things that go with it."

some things with her mother then and there.

Instead of not forgiving her for the last-minute cancellation, the same group gave Toni Peabody their next "Mother of the Year" award!

* * *

Ambassador Jimmy Symington, the socially impeacable, handsome young chief of protocol, made his professional debut as a singer at the Shoreham Hotel the other evening and was a smash hit.

The hotel's Blue room was packed with a society audience that cried "Fabulous!," "Sensational!," "Encore!" and "More!" when he finally put his guitar down and took a bow.

Guitar Project

The attractive director of the striped pants set, who may next run for Congress from Missouri, was making a one night appearance only to raise money for his pet project—guitar lessons and, if warranted, guitars, for the neglected poor children of Washington's dreary Junior Village.

"A guitar," said Jimmy, "is something you can treat with tenderness and love, and it gives you back the same." This was something these children need.

Washingtonians who have to go to so many dinners that when they have a night off they stay home—turned out in a large numbers to hear him. And what they heard was a very professional poised young man who interspersed his songs with an amusing patter.

"Doug Cater asked me if I

estranged wife [illegible] made a recent sale that firmly establishes her as a Washington sculptor of note. Although people were aware of her artistic talents, until last summer she was best known as the wife of the CIA boss because glamorous government jobs get more publicity here than any interpreter of the arts.

Now the Washington Gallery of Art has sold for $3,000 her garden bronze fountain sculpture of a young boy—her own son at a tender age—who is crouching down on a log and looking with beguiling interest at a frog. The purchasers were James Ramsay Hunt and his wife who is sister to the wife of Deputy Secretary of Defense Paul Nitze.

Yours, B. B.

Aga Khan's Sardinia 'Development' Draws Summer Resort Hounds

By Betty Beale
Special to The Bee

WASHINGTON — While the nation is suffering from tube eyestrain or Chicagnitis, and the Democrats are trying to unwind from their quadrennial swivet, the social pace in Newport, R.I., unfazed by it all, continues in its reassuring fashion.

Despite its tradition as "the" summer address, Newport of course is not the only posh summer vacation spot. Far from the crowds and threats of riots, the Aga Khan's heavenly new resort on the Island of Sardinia is gaining quickly in popularity.

Jay and Sharon Rockefeller, the glamour couple whose political prospects seem to be unlimited, own a house on the Costa Smeralda, which is the Aga's part of the island. Sharon's parents, Sen. and Mrs. Charles Percy, and their other children, who now are cruising in a chartered yacht on the Mediterranean, may put in there just to take a look.

Princess Alexandra and her husband, Angus Ogilvy, are constantly seen there. Rosalind Russell and her husband, Freddy Brisson, have been there this summer. Loel Guinness' magnificent yacht has been one of the 75 or 80 glistening yachts in the harbor at Puerto Cervo, and Tim Rootes of the Rolls Royce fortune has a house there.

The young Aga is determined to turn the rocky, Maine-like coast with its 82 sandy beaches into the smartest international resort in the world. He wants it elegant, not a jet set hangout.

During the past weeks you couldn't find a hippie in the whole area. The young might wear their hair a little long but they belong to the beautifully decked out, well-heeled segment of society.

Not the least fascinating of the Aga's developments is the little 17th Century village of Puerto Cervo that looks like something off a stage set. He also has built three big hotels and apartments designed like compilations of small houses, with some one-bedroom units for as modest a price tag as $12,000. That is so cheap compared to anything in the United States, Americans will probably flock there.

As the first agents for the Costa Smeralda, the Aga chose a Washington couple he has never met -- former American diplomat John Begg and his wife, Jeanne—to form the Islands Investment Corp.

Luckiest man in Paris, in his own opinion, is Robert O. Blake, new American minister to France.

Blake, a career diplomat, was all set to leave Washington and his family to head all civilian operations in the Mekong Delta, when Undersecretary of State Nicholas Katzenbach told him he was going to the plush capital of France instead. By this weekend he and his family have debarked and are ensconced in a beautiful government-owned house on the Left Bank.

The big switch came when Ambassador Sargent Shriver asked for a new minister who spoke French fluently and knew a great deal about Russia. When he found out Bob not only filled this bill but during the past year in Washington had organized 200 foreign service officers to give of their free time to inner city people, Sarge quickly said he'd take Blake.

Mrs. Blake, the former Sylvia Whitehouse, daughter of the Sheldon Whitehouses of New York and Newport, got a whole new wardrobe of American clothes to take to the fashion center of the world.

The Spanish Ambassador and Marquesa de Merry del Val got up a swinging dinner party for 40 just before the Democratic Convention on only 48 hours' notice.

Ordinarily, Washington rank has to be lined up a month in advance. But in the dog days of August it takes no time to put on a party of pomp, pep and pulchritude.

The dinner dance for Paris visitors turned out to be an unexpected farewell for Argentine Ambassador and Mrs. Alsogaray and Colombian Ambassador and Mrs. Echevarria. Neither man has been here for two years yet, which points up the rapid annual turnover of ambassadors — at least 25 per cent.

Alsogaray, an able politician, is going back home to persuade Argentina to adopt a more stable government which will include a prime minister as well as president. If it does, he may become the prime minister.

Also present was Lady Bird Johnson's niece, Mrs. Donald MacArthur, who is married to handsome Scotsbred scientist, deputy director of defense research, and is a very smart cookie herself.

Pretty, feminine Diana, daughter of Tony Taylor, knows all about ghetto gangs such as West Chicago's Conservative Vice Lords, Inc., New York's Real Great Society and California's Mission Rebels. These are gangs, she was saying, which don't want to end up in cemeteries or penitentiaries so have organized to help themselves to fit into "the system."

To help them she has volunteered her services to the new parent organization in Washington, YOU (Youth Organization United), and as chairman of its finance committee is raising money for it.

On a professional basis she has opened her own youth consulting firm.

So much news of FDR's romance with Lucy Mercer Rutherfurd was printed when Jonathan Daniels' "Washington Quadrille" came out that some of the other fascinating nuggets in the book were overlooked.

For instance, Alice Longworth — of whom her father said, "I can try to run the country or control Alice; I can't possibly do both" — appears throughout the book. And not the least fascinating story is how she and her husband made their own home brew during Prohibition.

As strong opponents of Prohibition, "they bought quantities of grapes and experimented in making wine." They also had, according to Alice, "a small still with which our butler managed to concoct a very passable gin from oranges."

Daniels recalls the Eugene Meyer dinner that instigated the Alice Longworth - Dolly Gann precedence feud. It started, he reveals, when Mrs. Meyer told Alice she was going to seat Vice President Curtis' sister at the highest spot at her dinner — ahead of Speaker Longworth's wife and other officials' wives.

When mischief-making Alice told her husband about the plan he used it as an excuse not to go to a "despised, dry dinner."

Incidentally, the protocol office at the State Department, for fear of getting into another feminine feud, has ever since that day refused to issue an approved list of precedence bearing the State Department's okay.

Former World Bank President George Woods and his wife, who have a house outside Lisbon, have returned to Portugal from Jerusalem in time for the "big parties," writes Louise.

She must be referring to the Pierre Schlumbergers' ball for 1,000 in their 16th Century house near Lisbon this Wednesday that is the talk of social Europe and America. Also the Atenor Patinos' ball Friday.

The ultra-chic Sao, second wife of the Texas industrialist, whose Houston house is done in exquisite taste, can be counted upon to produce something close to perfection even for a thousand.

Woods, incidentally, had his portrait painted in Portugal last month — the official one for the World Bank — by Henrique Medina, who also painted both CIA Director John McCone and his wife, Ty. Louise says of the Woods' portrait, "It's terrific!"

Sonja Haraldsen, future queen of Norway, who became the bride of Crown Prince Harald Thursday, once worked in a foreign home just as Anne-Marie Rockefeller did.

Longtime Norwegian diplomat Elovius Mangor telephoned the other day to say how pleased he was this correspondent's article about "Mia" Rockefeller indicated she was not a servant in the Nelson Rockefeller household where she met Steven.

Daughters of the best families in Scandinavia frequently take what they call an "au pair" post in a foreign country to learn a language, he said. They are taken into the family and earn their keep by doing housework just as a daughter of the family would do. Said Mangor, even the future queen of Norway had had an "au pair" post in France.

Mia's father, he added, is a Norwegian merchant and she "was beautifully brought up."

There's a Gem of a Reason for Small Debut

By Betty Beale

WASHINGTON — While the nation is suffering from tube eyestrain or Chicagoitis, and the Democrats are trying to unwind from their quadrennial swivet, the social pace in Newport, R.I., unfazed by it all, continues in its reassuring fashion.

The plush resort has been buzzing for weeks with the story of the disagreement between Mrs. John Bryce and her brother Huntington Hartford over their late mother's jewels.

Jo Bryce had Meyer Davis lined up for ages and invitations out for a ball of about 700 for Saturday, Aug. 31, in honor of her two debutante granddaughters, Dallas Pell and Betty O'Donnell. Dallas is the charming offspring of her chic daughter Nuala and dignified Sen. Claiborne Pell of Rhode Island.

BEALE

According to the grapevine, Huntington wanted his daughter to be the third honoree at the party to which his sister happily agreed but suggested as a return favor that he produce her mother's jewels.

Whether Hartford wouldn't or couldn't because he had bestowed them on wives, the disagreement was followed by a cancellation of the party altogether, with the explanation that Mrs. Bryce felt it would be inappropriate to have such a big ball during times of so much social unrest. In view of the senator's political connections, this may have been the real reason but to the Newport grapevine the gem of a reason was some very real gems.

The two granddaughters ended up by getting their party on the 31st, but a much smaller one for just the young set which in Newport adds up to less than 200.

* * *

Also people have been living it up, far from crowds and threats of riots, in the Aga Khan's heavenly new idyllic resort on the Island of Sardinia.

Jay and Sharon Rockefeller, the glamor couple whose political prospects seem to be unlimited, own a house on the Costa Smeralda, which is the Aga's part of the island. Sharon's parents, Sen. and Mrs. Charles Percy, and their other children, who are now cruising in a chartered yacht on the Mediterranean, may put in there just to take a look.

Glistening Yachts in Harbor

Princess Alexandra and her husband, Angus Oglivy, are constantly seen there. Rosalind Russell and her husband Freddy Brisson have been there this summer. Loel Guinness' magnificent yacht has been one of the 75 or 80 glistening yachts in the harbor at Puerto Cervo, and Tim Rootes of the Rolls Royce fortune has a house there.

The young Aga is determined to turn the rocky, Maine-like coast with its 82 sandy beaches into the smartest international resort in the world. He wants it elegant and not a jet set hangout.

During the past weeks you couldn't find a hippie in the whole area. The young might wear their hair a little long but they belong to the beautifully decked out, well-heeled segment of society.

Not the least fascinating of the Aga's development is the little 17th century village of Puerto Cervo that looks like something off a stage set. He has also built three big hotels and apartments designed like compilations of little houses, with some one-bedroom units for as modest a price tag as $12,000. That is so cheap compared to anything in the U.S.A., Americans will probably flock there.

As the first agents for the Costa Smeralda, the Aga chose a Washington couple he has never met — former American diplomat John Begg and his wife Jeanne, who together form the Islands Investment Corp.

* * *

Luckiest man in Paris, in his own opinion, is Robert O. Blake, new American minister to France.

Blake, a career diplomat, was all set to leave Washington and his family to head all civilian operations in the Mekong Delta, when Under Secretary of State Nicholas Katzenbach told him he was going to the plush capital of France instead. By this weekend he and his family have debarked and are ensconced in a beautiful government-owned house on the Left Bank.

The Big Shriver Switch

The big switch came when Ambassador Sargent Shriver asked for a new minister who spoke French fluently and knew a great deal about Russia. When he found out that Bob not only filled this bill but during the past year in Washington had organized 200 foreign service officers to give of their free time to inner city people, Sarge quickly said he'd take Blake.

Mrs. Blake, the former Sylvia Whitehouse, daughter of the Sheldon Whitehouses of New York and Newport, got a whole new wardrobe of American clothes to take to the fashion center of the world.

* * *

The Spanish Ambassador and Marquesa de Merry del Val got up a swinging dinner party for 40 just before the Democratic Convention on only 48 hours' notice.

So much news of FDR's romance with Lucy Mercer Rutherfurd was printed when Jonathan Daniels' "Washington Quadrille" came out that some of the other fascinating nuggets in the book were overlooked.

Run Country or Control Alice

For instance, Alice Longworth, of whom her father said, "I can try to run the country or control Alice; I can't possibly do both", appears throughout the book. And not the least fascinating story is how she and her husband made their own home brew during prohibition.

As strong opponents of the latter, "they bought quantities of grapes and experimented in making wine." They also had, according to Alice, "a small still with which our butler managed to concoct a very passable gin from oranges."

Daniels recalls the Eugene Meyer dinner that instigated the Alice Longworth-Dolly Gann precedence feud. It started, it reveals, when Mrs. Meyer told Alice that she was going to seat Vice-president Curtis' sister at the highest spot at her dinner — ahead of Speaker Longworth's wife and other officials' wives.

When mischiefmaking Alice told her husband about the plan he used it as an excuse not to go to a "despised, dry dinner."

Incidentally, the protocol office at the state department, for fear of getting into another feminine feud, has ever since that day refused to issue an approved list of precedence bearing the state department's okay.

* * *

Former World Bank President George Woods and his wife, who have a house outside Lisbon, have returned to Portugal from Jerusalem in time for the "big parties", writes Louise.

She must be referring to the Pierre Schlumbergers' ball of 1,000 in their 16th century house near Lisbon on Sept. 4 that is the talk of social Europe and America. Also the Atenor Patinos' ball on the 6th.

The ultra-chic Sao, second wife of the Texas industrialist, whose Houston house is done in exquisite taste, can be counted upon to produce something close to perfection even for a thousand.

George Woods, incidentally, had his portrait painted in Portugal last month — the official one for the World Bank — by Henrique Medina, who also painted both CIA Director John McCone and his wife Ty. Louise says of the Woods' portrait, "It's terrific!"

* * *

Sonja Haraldsen, future Queen of Norway, who become the bride of Crown Prince Harald on Thursday, once worked in a foreign home just as Anne-Marie Rockefeller did.

Longtime Norwegian diplomat Elovius Mangor telephoned the other day to say how pleased he was that this correspondent's article about "Mia" Rockefeller indicated that she was not a servant in the Nelson Rockefeller household where she met Steven.

Daughters of the best families in Scandinavia frequently take what they call an "au pair" post in a foreign country to learn a language, he said. They are taken into the family and earn their keep by doing housework just as a daughter of the family would do. Said Mangor, even the future Queen of Norway had had an "au pair" post in France.

Mia's father, he added, is a Norwegian merchant and she "was beautifully brought up."

Dallas Pell, Huntington Hartford's great-niece, bows to society next weekend in Newport, R. I. She is pictured here with her father, Sen. Claiborne Pell (D-R.I.) The coming-out has been the subject of much speculation.

Scientist Donald MacArthur and his wife Diana, who is Mrs. Lyndon Johnson's niece, chat at a Spanish Embassy party with Col. Howard Burris, founder and president of Heritage Gardens, Washington's coming historical Disneyland.

Frightening

Dr. Donald M. MacArthur, deputy director of research for the Defense Department, has complained that declining appropriations and rising public opposition will prevent the development of a synthetic germ weapon for which there would be no natural antidote. It is a terrifying thought.

Within five to 10 years molecular biologists could develop a "synthetic, biological agent, an agent that does not naturally exist and for which no natural immunity could have been acquired," MacArthur said in testimony before the House defense appropriations subcommittee. The agent "could differ in certain important aspects from any known disease-causing organisms," he said. But most important, it might repel "the immunological and therapeutic processes upon which we depend to maintain our relative freedom from infectious disease."

This is a prescription for possible disaster. An agent of the character described by MacArthur could sweep continents perhaps even more effectively than by atomic weapons. Only the hope that some naturally resistant members of the species could survive would stand between man and utter destruction.

Growing public criticism of biological warfare programs can only be redoubled by this kind of knowledge.

Soviet Doctrine Envisions Use Of Chemical Weapons

WASHINGTON (AP) — The chairman of the joint chiefs of staff has told Congress Soviet military doctrine anticipates use of chemical and biological weapons in any future large-scale war.

Gen. Earle G. Wheeler called that doctrine outmoded, but said Soviet inventories of chemical and biological weapons still "are quite large."

His estimates of the Soviet and U.S. stockpiles were deleted by the censor from June 12 testimony before the Senate defense appropriations subcommittee, a transcript of which was made public Friday.

President Nixon on Nov. 25 renounced U.S. use of lethal chemical weaons unless an enemy employed them first. He ruled out the use of biological weapons under any circumstances, and said the United States will dispose of its stockpiles of those devices.

In his June 12 testimony, Wheeler said he hopes the situation is one in which no nation would unleash chemical or biological warfare for fear of retaliation.

Dr. Donald M. MacArthur, a Pentagon research deputy, testified on Sept. 17 the Soviet Union "appears to be much more completely prepared to start, fight and defend against a chemical war today than the United States.

"Russian stockpiles are much larger, and Russian training, more comprehensive, in both offensive and defensive missions," MacArthur told the subcommittee.

He said the United States has been criticized for reaching an overkill position in chemical weapons. "I have explained that our chemical agents can't kill everyone in the world," he said. "We believe the U.S. should have enough chemical stocks to act as a credible deterrent and to have a minimal retaliatory capability if deterrence fails."

Defense Research Cutback May Stir Up Some Confusion

By DIETRICK E. THOMSEN
Science Service Writer

WASHINGTON — Scientists who get money from the Department of Defense have been getting bad news for years. This year the message was especially bad. The script was written by Sen. Mike Mansfield (D-Mont.), majority leader of the Senate, who topped off a billion-dollar cut in Defense's requested $8 billion research and development budget for fiscal year 1970 with a prohibition amendment. Now famous as Ariticle 203, the amendment forbids the department to spend any of the appropriated year and a half about the possibility of State's taking over some of Defense's projects in the social sciences. Nothing solid has come of the talks, says Dr. Donald M. MacArthur, deputy director of Defense Research and Engineering. There is speculation that people at State are reluctant to get involved in basic social-science research of the sort the Pentagon is doing.

In physical sciences the alternative for many will be the National Science Foundation. The Science Foundation's policy is that anyone dropped by the Defense agency as part of the giving agency's activities. Since the Mansfield amendment forbids using the Defense appropriation for research unrelated to Defense's mission, it seems to forbid such subcontracting by definition.

The alternative of putting supplemental appropriation bills through Congress remains, but is unlikely to be used since the 1971 budget is almost ready for presentation. There is the chance that adjustments are likely to be made in the 1971 budget, which takes effect next July, instead of further tinkering with this year's budget.

money on research projects not related to its mission.

Article 203 is the culmination of several years of Congressional grumbling about Defense's alleged tendency to build a research empire for itself in areas where Congressmen thought it had no business to be. "It was the only agency that could always get more for research than it asked for," says an official of the Democratic Policy Committee. For several years Mansfield and others have been trying to change this favored status.

The problem with Article 203 is that it neither defines the Defense Department's mission nor names any categories of research that are in or out. It is open to wide intrepretation and raises the need for an arbiter.

Defense had hopes that the National Academy of Sciences would be the arbiter, and had invited the Academy to join in a review of Defense research efforts to see what ones violate Article 203. But the Academy tossed the potato right back. "The academy is ready to give advice," says a spokesman, "but we feel it would be sensible for the Defense Department to take a first stab at the situation."

The department is proceeding to review its research programs. It is still too early to tell what categories may go or to name specifiec projects that may be discontinued, but it is clear that with the budget cut and Article 203 something will have to go. The department has been negotiating with other government agencies to see if they can take up the slack.

Some of these talks have been going on since the Defense Department began to have Congressional trouble. Defense has been talking to the State Department for a Department will have to go through the same procedures of application and evaluation as anyone else on the NSF lists. People who have been supported by Defense are already getting in line. "There are dozens or a hundred or more," says Dr. Paul F. Donovan, director of NSF's intermediate energy physics program, and impementation of Article 203 has not yet been carried out. When that happens, there may be a further substantial increase, he says.

This sort of thing could lead to a severe money problem at the Science Foundation and other agencies unless additional money is made available to them. It was not Mansfield's intention to provoke such a crisis, says a spokesman for the Democratic Policy Committee, but rather to relieve Defense of research projects in favor of other agencies. This committee suggests the possibility of transferring money for Defense to other agencies.

According to Budget Bureau opinion, however, such transfer of funds appropriated for fiscal 1970 seems impossible. One Federal agency can give money to another, but only if the receiving agency does some work on behalf of the giving

Unless something is done, interpretation of Article 203 could bring dire consequences to the nation's research establishment. At the University of Illinios, for example, over half the outside support for research in the Engineering College comes from the Defense Department says Dr. Daniel Alpert, dean of the college. About one-third of the work in the university's Materials Research Laboratory is basic enough to be subject to different interpretations under the Mansfield amendment. The University will contend that the research is relevant to Defense's mission, but, says Dean Alpert, "We've got to hold our breath and hope for the best."

If Defense Department support is cut immediately, says Dr. Charles Schwartz, associate professor of physics at the University of California at Berkeley, a bitter situation of competition for available funds will develop.

Dr. Schwartz feels that the Mansfield amendment is a good thing even though he has an Air Force contract he may lose as a result of it. He feels scientific leaders should start to work with Congress to provide alternate means of support for the day when the impact of Article 203 reaches the laboratories.

The Santa Fe New Mexican (Santa Fe, New … · 23 May 1973, Wed · Page 6

Valedictorian of the senior class at Mount Airy High School in Towson, Md., is Leeza Tschursin, granddaughter of Mr. and Mrs. Antonio J. Taylor, who attended school here in earlier years. She transferred to Mount Airy after freshman and sophomore year studies at Santa Fe Preparatory School and a previous year at Loretto Academy.

Attending her graduation on May 30 will be her grandfather since he just happens to have business at the east at the time. He will visit at the home of Leeza's mother, Mrs. Donald MacArthur, the former Miss Diana Taylor, in Washington, D.C. Leeza plans to remain in Washington to work this summer, departing from her usual custom of spending the vacation months in Santa Fe.

WEDDINGS ARE A TIME for tradition and it will be followed on June 19 when Miss Elizabeth Tschursin and John Francis Bierschenk are married at St. Francis Cathedral. Family and old friends of the family have been invited to attend the nuptial mass at 10:30 a.m. and the reception that will follow at the home of the bride's grandparents, Mr. and Mrs. Antonio J. Taylor. The guests further include the college set of the bride and groom both of whom attend the College of Santa Fe.

"Leeza," to use the bride's chosen nickname, is the daughter of Dr. and Mrs. Donald M. MacArthur of Washington, D.C., who will be arriving about a week before the wedding. Mrs. MacArthur, the former Miss Diana Taylor, introduced her daughter to Santa Fe at an early age with schooling at Loretto Academy in the first grade. Leeza returned to the east to attend the Madeira School in Maryland and to finish preparatory school in Baltimore before she again came to Santa Fe for college. She has called Santa Fe home for three years, attending St. John's College the first year and College of Santa Fe the past two.

Also arriving the week before the wedding, will be the groom's parents, Mr. and Mrs. John Bierschenk, and his paternal grandfather, all of Temple,Texas.

Others in the wedding party will include Miss Jennifer McLaughlin, maid of honor, and Mrs. Jack Hopkins Jr., bridesmaid, a cousin of the bride. The bride's brother, Alexander Tschursin, Boston University student, and Tom McLaughlin will be ushers with the best man coming from Texas.

Mr. and Mrs. A.J. Taylor and Mrs. Jack Hopkins went east to visit his daughter and son-in-law, Dr. and Mrs. Donald MacArthur of Washington. Mrs. MacArthur, a Washington career woman, is remembered as the former Diana Taylor, and is a sister of Mrs. Hopkins. The MacArthurs recently purchased a condominium in Bethany Beach, Md., so they drove the short distance to see this beautiful area, a new development in a magnificent setting.

Texans bring a Lone Star Christmas to Washington

Continued from Page 1

Not everyone, of course, feels the urge to bankrupt their bank account before the New Year.

The Texans in town, who celebrated Christmas early before scattering home, seemed to cling to the simpler symbols and traditions of the Lone Star State.

Sandra Hall, who will return to Washington in January from Marshall to begin working for Rep. Steve Bartlett, R-Dallas, threw a party in her Georgetown row house for the staff of the State of Texas Federal Relations office.

The crowning touch of that gathering, besides the cannelloni, was a 9-foot scotch pine trimmed with Texas ornaments. Santas in chaps and cowboy hats, replicas of the state and balls with bluebonnets hung from the tree while yet another Santa, this one dressed in Levis and a cowboy hat, drove a train around the tree.

Atop it all was not a star, angel or elf, but a man-sized, black suede cowboy hat blinking with white lights.

"Because there are so many people in the business of public affairs here, Christmas is used as a time to go around and say howdy."
— Don Womack, a Texas Utilities representative in Washington

"I thought my favorite black cowboy hat would look great up there," said Sandra, the daughter of Rep. Sam Hall, D-Marshall.

The guests, all Texans, reportedly enjoyed the touches from home.

Elizabeth Morris, energy coordinator for the State of Texas office, doesn't spend the holiday in Washington and rarely gives a Christmas party because "there are so many to go to."

But she does make her friends homesick for Texas almost as soon as they get back with a New Year's Day party. It's all the ham, black-eyed peas and cornbread that you can eat.

There were more elaborate Texas bashes, and one of the memorable ones, according to the guests, was given by Wayne Gibbens, president of Mid-Continent Oil & Gas, and his wife.

The ornaments on the tree were little leather cowboy boots and the buffet table was filled with Tex-Mex food.

"It was delicious," said Bob Waldron, Lyndon Johnson's traveling secretary who now runs an interior design shop in Georgetown.

Waldron, a bachelor from Arp, thinks Christmas in Washington is "delightful."

He has been invited to no less than 25 Christmas get-togethers so far, and will accept an invitation to a day-after-Christmas party to be given by Lady Bird Johnson's niece and her husband, Donald MacArthur.

Although many of the government agencies throw Christmas office parties — the Equal Opportunity Employment Commission and the Securities and Exchange Commission even had some daylight disco — the highest in the government hierarchy can usually be found at some time during the season at the White House, enjoying a taste of the 15-odd tours, receptions, open houses and parties that the first family gives.

For the Reagans, the Christmas season means entertaining about 100,000 visitors in three weeks.

There are sessions to preview the decorations at the White House. Congress and its staff, at least 1,100 members of the news media, 400 children of the members of the diplomatic corps, senior citizens, the Secret Service, the White House staff and the handicapped have been sampling holiday cheer at the White House since Dec. 9.

Most of the town's professional partygoers, who step up their involvement socially at Christmas, don't think the cheerless state of the nation's economy has had an effect on the season.

"Because there are so many people in the business of public affairs here, Christmas is used as a time to go around and say howdy," said Don Womack, one of Texas Utilities' representatives in Washington who gives his friends a sample of his homemade chili blend at Christmas.

But there is a less glittery face to the holiday for those who were not invited to a tea at the vice president's house, a smorgasbord at the Swedish Embassy or a lavish Victorian Christmas at the home of conservative Richard Vigurie.

There will be single people who will not join the "party" at National Airport to go home to families. There will be native Washington families who will gather their families for a quiet celebration. And there are those — they may number 10,000 — who will spend most of the holiday on the street except for the special soup kitchen meals that volunteer groups will prepare and serve.

Lin Romano, a volunteer with the Center for Creative Non-Violence, said 600 are expected for her group's special Christmas Eve dinner. They may get a Christmas gift — probably a pair of socks.

For one homeless Washingtonian, the spirit of the season and the hope for world peace will only be realized when everyone can find shelter and "no one else freezes to death."

Merry Christmas.

Practice Experience:

Thirty-five years of community hospital anatomic and clinical pathology practice.

Research:

Borrelia biology and pathobiology :

- All areas in the realm of anatomic and clinical pathology, histologic diagnosis of spirochetes in tissue (animals, controls, infected cases submitted blindly for testing, immunohistochemistry applied to paraffin sections (Monoclonal antibodies for *borrelia burgdorferi*);

REPORT THIS AD

- Design of immunodiagnosis methodologies for Borrelia antibodies in blood;
- Dark field microscopy of *Borrelia* in cerebrospinal fluid and blood;
- Culture and primary isolation of wild type *Borrelia* strains from human autopsy tissues, fetal autopsies, human adult blood, and human skin biopsies of Erythema migrans punch biopsies;
- Polymerase Chain Reaction of triturated human tissue for detection of *borrelia* DNA;
- Design of DNA probes for detection of *Borrelia* in human tissue using FISH method;

- Design of Molecular Beacons for detection of DNA of *Borrelia* species (of both USA and European strains of borrelia) in human tissue, and Borrelia miyamotoi in human tissues and human body fluids;

- First Isolation of *borrelia burgdorferi* in culture from autopsy fetal brain (Miscarriage);

- First isolation of *borrelia* from frozen autopsy Alzheimer's brain;

- First description of Cystic *Borrelia burgdorferi* in world's literature;

- First description of granular forms of *Borrelia burgdorferi* in human tissue (Alzheimer's disease);

- First proof, by FISH study, that brain Granulovacuolar Degeneration in Alzheimer's disease is due to granular forms of *Borrelia* which have penetrated human neurons;

- First direct identification of *Borrelia* spirochetes inside the cytoplasm of human neuronal cells in Alzheimer's disease autopsy brain;

- First description of Spheroplast forms of *Borrelia burgdorferi* in human tissue and in culture;

REPORT THIS AD

REPORT THIS AD

- First description of transfection of human DNA by *Borrelia burgdorferi* DNA via horizontal DNA transfer;

- First to prove that amyloid plaques in Alzheimer's disease all contain biofilms of *Borrelia* dwelling inside of the topography of the plaques;

- First description of *Borrelia* Temporal arteritis with blindness (1989);

- First description of liposomal form of *Borrelia* (blebs) by electron microscopy, 1988;

- First description of electron microscopy identification of *Borrelia* in blood of Multiple Sclerosis patient;

- First serostudy of Amyotrophic Lateral Sclerosis patients from Long Island, New York area for antibodies to *Borrelia* species, with identification of 20% seropositive rate for *Borrelia* infection in ALS patients as compared with background rate of seropositive patients 8.2% in year 1987-1988;

- Elucidation of the "negative phase" in Borreliosis as a state in which infective *Borrelia* in minute granular form reconstitute spiral *borrelia* forms in *in vitro* cultures;

- Suggestion that autoimmune phenomenon in Borreliosis patients may represent proteins of *Borrelia* deposited on human cytoplasmic membranes consequent to Borrelia transfection of human DNA and resultant production of *Borrelia* proteins from the infected/transfected human DNA;

- Identification of 100 cases of *Babesia microti* infection in humans with Borreliosis with all categories of disease including death, transplacental transfer of infection in utero to the fetus, asymptomatic *Babesia* carrier state;

- Proof of *Babesiosis* with hamster inoculation method with seronegative cases;

  - Discovery of *Babesia* ***microti*** species seronegative *Babesia* infections in humans in 1986-1990. (in retrospect probable examples of *Duncani* species human babesiosis from East coast, USA tick vectored infections);

Additional commentary on research projects completed:

1985 to Present:

The investigation of autopsy Alzheimer's brain tissues for evidence of *Borrelia burgdorferi* and *Borrelia miyamotoi*.

This approach was inspired by the model of Dr Hideyo Noguchi, who proved that *Treponema pallidum* infection in its tertiary phase was the cause of General Paresis.

Like syphilis, Lyme Borreliosis is recognized as having primary, secondary and tertiary manifestations. In 1985 I requested frozen Alzheimer's disease brains from Dr. George Glenner who maintained a research Brain Bank at the University of California, San Diego.

I received four frozen whole brains, after my credentials to undertake research studies were approved by Dr Glenner and by the Institutional Review Board of the Medical staff of Southampton Hospital, Southampton, N.Y. I had acquired experience in the primary isolation of *Borrelia burgdorferi* from human tissue in studies of the Erythema migrans lesion.

I was in possession of positive and negative control material from earlier studies which I completed on Gestational Lyme Borreliosis. I commenced culture of 0.5cm cubes of flame-sterilized thawed Alzheimer hippocampus and observed the cultures for growth of *Borrelia* spirochetes.

I submitted a manuscript to the Journal of the American Medical Association, which was entitled "*Borrelia* in the brains of patients dying with Alzheimer's disease". The Editors were concerned that the words "Alzheimer's disease" in the title would create problems among the readership and returned the manuscript for title revision, agreeing to publish my report of positive culture results as a "letter to the editor", with the words "*Borrelia* in the Brains of Patients Dying with Dementia".

This substitution to placate the Editor also meant that the phrase "Alzheimer's disease" was removed from the title and the word "Dementia" substituted. (JAMA, 1986, 256:2195-6) .

The classification of the cultured spirochetes from 2 patient autopsy hippocampus specimens was substantiated by positive immunoreactivity with Murine monoclonal antibodies H5332, and H9724, which were on hand in the laboratory courtesy of the generosity of Dr. Alan G. Barbour, at the Rocky Mountain Laboratory, NIAID, NIH, Hamilton Montana.

Subsequent studies of additional cases of Alzheimer's disease yielded more culture positive cases.

In 1987, the editors of the first-line academic pathology journal Human Pathology accepted a case report entitled "Concurrent Neocortical Borreliosis and Alzheimer's Disease. This was the first publication which allowed the use of the words "Alzheimer's" and "Borreliosis" in the title.

Subsequent work revealed a culture-positive case of Alzheimer's disease, from Dr. Glenner's Brain Bank, which disclosed a "cystic" form of *Borrelia burgdorferi* in tissue section, and immunoreactive *Borrelia* cysts with Dr. Barbour's gift of murine monoclonal antibody H9724 which recognizes the flagellin epitopes of *Borrelia burgdorferi* and related relapsing fever *borrelia*.

REPORT THIS AD

REPORT THIS AD

This report was published in the Annals of the New York Academy of Sciences, 1988, 539: 468-70. I began work on molecular detection methods for the *Borrelia burgdorferi* genomic elements in Alzheimer's disease tissues – initially with PCR detection of the Flagellin B transcriptome, and subsequently with Fluorescein-labeled specific DNA probes for *in situ* DNA hybridization {FISH method}.

In 1993, Dr Judith Miklossy published her first paper on Alzheimer's disease and neuroborreliosis. Dr Miklossy has continued to produce multiple landmark manuscripts on Alzheimer's neuroborreliosis, the most recent in 2011 reviewing the evidence from the perspective of Koch and Hill's hypotheses.

My present research is the utilization of Molecular Beacons for *in situ* DNA hybridization to detect *Borrelia* transcriptomes in Alzheimer's disease autopsy brain tissues. Such tools have produced image evidence via i*n situ* DNA hybridization with both Molecular Beacons and conventional FISH reagents, that the Alzheimer plaques bind and hybridize with DNA probes which are uniquely specific for *Borrelia* DNA [Fla B ORF BBO 147], and *Borrelia miyamotoi* DNA .

The Alzheimer plaques and the GVB bodies hybridize with these FISH DNA probes, while the human autopsy brain tissue between the plaques and the GVB bodies produces no hybridization signals.

Based on these observations, it is my view that the Alzheimer plaques in Neuroborreliosis-related AD cases are Biofilm communities, consisting of Granular *Borrelia*, Cystic *Borrelia*, Cell wall-deficient *Borrelia* and peripheral rim-like areas of spiral *borrelia*.

Water channels are features of biofilms. Empty spaces within Alzheimer plaques also are consistent with water channels of borrelia biofilms. The possibility of mixed-species biofilms in AD plaques has merit, and multi-species infections are an open possibility in Neuroborreliosis-related AD cases.

I continue my work on primary isolation of *Borrelia* from Alzheimer's brain tissue. I believe that Molecular Beacons are the ultimate FISH DNA/RNA probes, because Molecular Beacons are endowed with the property of rejecting all potential hybridization sites in tissue if *even a single base mismatch* exists between the Molecular Beacon DNA probe and any potential hybridization tissue site.

FISH DNA/RNA hybridization is unique in allowing *back* correlation of areas showing hybridization with the DNA probes with tissue sites also showing either AD plaques or GVB foci by conventional methods.

MCI, Inc. (previously **Worldcom** and **MCI WorldCom**) was a telecommunications company. For a time, it was the second largest long-distance telephone company in the United States, after AT&T. Worldcom grew largely by acquiring other telecommunications companies, including MCI Communications in 1998, and filed bankruptcy in 2002 after an accounting scandal, in which several executives, including CEO Bernard Ebbers, were convicted of a scheme to inflate the company's assets. In January 2006, the company, by now renamed MCI, was acquired by Verizon Communications and was later integrated into Verizon Business.

Worldcom was originally headquartered in Clinton, Mississippi before relocating to Ashburn, Virginia when it changed its name to MCI.[1][2]

Foundation

In 1983, in a coffee shop in Hattiesburg, Mississippi, Bernard Ebbers and 3 other investors formed Long Distance Discount Services, Inc. based in Jackson, Mississippi and in 1985, Ebbers was named chief executive officer. The company acquired over 60 telecommunications firms and in 1995, it changed its name to WorldCom.[3]

The company became a public company as a corporation in 1989 as a result of a merger with Advantage Companies Inc.[4] The company name was changed to **LDDS WorldCom**in 1995, and relocated to Clinton, Mississippi.

The company grew rapidly in the 1990s, after completing several mergers and acquisitions.

Worldcom's first major acquisition was in 1992 with the $720 million acquisition of Advanced Telecommunications Corporation, outbidding larger rivals Sprint Corporation and AT&Tto secure the deal, making Worldcom a larger player in the telecoms market.[5]

Other acquisitions included: Metromedia Communication Corp. and Resurgens Communications Group in 1993,[6] IDB Communications Group, Inc (1994), Williams Technology Group, Inc. (1995), and MFS Communications Company (1996), and MCI in 1998. The acquisition of MFS included UUNET Technologies, Inc., which had been acquired by MFS shortly before the merger with WorldCom. In February 1998, WorldCom acquired CompuServe from its parent company H&R Block. WorldCom then retained the CompuServe Network Services Division, sold its online service to America Online, and received AOL's network division, ANS. WorldCom acquired the corporate parent of Digex, Intermedia Communications in June 2001 and then sold all of Intermedia's non-Digex assets to Allegiance Telecom.

MCI acquisition

On November 4, 1997, WorldCom and MCI Communications announced a $37 billion merger to form MCI WorldCom, making it the largest corporate merger in U.S. history. On September 15, 1998, the merger was consummated, forming **MCI WorldCom**. MCI divested itself of its "internetMCI" business to gain approval from the U.S. United States Department of Justice.[7]

Proposed Sprint merger

On October 5, 1999, Sprint Corporation and MCI WorldCom announced a $129 billion merger. Had the deal been completed, it would have been the largest corporate merger in history. The merged company would have surpassed AT&T as the largest communications company in the United States. However, the deal floundered due to opposition from the United States Department of Justice and the European Union on concerns that it would create a monopoly. On July 13, 2000, the boards of directors of both companies terminated the merger. Later that year, MCI WorldCom renamed itself "WorldCom".[8]

Accounting scandals

See also: Cynthia Cooper, Eugene Morse, and WorldCom scandal

Between September 2000 and April 2002, the board of directors of Worldcom authorized several loans and loan guarantees to CEO Bernard Ebbers so that he would not have to sell his Worldcom shares to meet margin calls as the share price plummeted during the bursting of the dot-com bubble. By April 2002, the board had lost patience with these loans. Directors also believed that Ebbers didn't seem to have a coherent strategy after the Sprint merger collapsed. On April 26, the board voted to ask for Ebbers' resignation. Ebbers formally resigned on April 30, 2002 and was replaced by John W. Sidgmore, former CEO of UUNET. As part of his departure, Ebbers's loans were consolidated into a single $408.2 million promissory note.[9][10][11]:216–218 In 2003, Ebbers defaulted on the note and Worldcom foreclosed on many of his assets.[12]

Beginning modestly during mid-1999 and continuing at an accelerated pace through May 2002, Ebbers, CFO Scott Sullivan, controller David Myers and general accounting director Buford "Buddy" Yates used fraudulent accounting methods to disguise WorldCom's decreasing earnings in order to maintain the company's stock price.[12]

The fraud was accomplished primarily in two ways:

1. Booking "line costs" (interconnection expenses with other telecommunication companies) as capital expenditures on the balance sheet instead of expenses.
2. Inflating revenues with bogus accounting entries from "corporate unallocated revenue accounts".

In June 2002, a small team of internal auditors at WorldCom led by division vice president Cynthia Cooper and senior associate Eugene Morse worked together, often at night and secretly, to investigate and reveal what was ultimately discovered to be $3.8 billion worth of fraudulent entries in WorldCom's books.[13][14] The investigation was triggered by suspicious balance sheet entries discovered during a routine capital expenditure audit. Cooper notified the company's audit committee and board of directors in June 2002. The board moved swiftly, forcing Myers to resign and firing Sullivan when he refused to resign. Arthur Andersen withdrew its audit opinion for 2001.[11]:223–264 Cooper and her team had exposed the largest accounting fraud in American history, displacing the fraud uncovered at Enron less than a year earlier. It would remain the largest accounting fraud ever uncovered until the exposure of Bernard Madoff's giant Ponzi scheme in 2008.

By this time, the U. S. Attorney for the Southern District of Mississippi, the Federal Bureau of Investigation and the U.S. Securities and Exchange Commission were already looking into the matter as well. The SEC launched a formal inquiry into these matters on June 26, 2002.[11]:265 The SEC was already investigating WorldCom for questionable accounting practices.[15] By the end of 2003, it was estimated that the company's total assets had been inflated by about $11 billion.[12]

The fraud came to light just days after Andersen was convicted of obstruction of justice in the Enron scandal, a verdict that effectively put Andersen out of business. In his post-mortem of the Enron scandal, *Conspiracy of Fools*, journalist Kurt Eichenwald argued that Andersen's failure to uncover WorldCom's deceit would have brought Andersen down even if it had escaped the Enron fraud unscathed.[16]

Bankruptcy

On July 21, 2002, WorldCom filed bankruptcy in the largest such filing in United States history at the time (overtaken by the bankruptcies of both Lehman Brothers and Washington Mutual in a span of eleven days during September 2008). The WorldCom bankruptcy proceedings were held before U.S. Federal Bankruptcy Judge Arthur Gonzalez, who simultaneously heard the Enron bankruptcy proceedings, which were the second largest bankruptcy case resulting from one of the largest corporate fraud scandals. None of the criminal proceedings against WorldCom and its officers and agents were originated by referral from Gonzalez or the Department of Justice lawyers. By the bankruptcy reorganization agreement, the company paid $750 million to the SEC in cash and stock in the new MCI, which was intended to be paid to wronged investors.[17]

Effective December 16, 2002, Michael Capellas became chairman and chief executive officer.[18] On April 14, 2003, WorldCom changed its name to **MCI**, and relocated its corporate headquarters from Clinton, Mississippi, to Ashburn, Virginia.[19]

Even before then, however, employees from the MCI side of the merger had taken over top executive posts, while many longtime executives from the old WorldCom were pushed out. In late 2002, the company began moving most of its operations to its campus in Ashburn, which had opened in 2000. Capellas, for instance, spent most of his time in Northern Virginia. After the name change, one executive from the old MCI said, "We're taking our company back." Another wrote in an email, "My company was not founded in a motel coffee shop."[11]:320

In May 2003, in a controversial deal, the company was given a $45 million no-bid contract by the United States Department of Defense to build a

cellular phone service in Iraq as part of the U.S.-led reconstruction effort despite the fact that the company was not known for its expertise in building wireless networks.[20][21]

WorldCom agreed to pay a civil penalty of $2.25 billion to the U.S. Securities and Exchange Commission. The deal was approved by federal judge Jed Rakoff in July 2003.[22] In a sweeping consent decree, the SEC and Rakoff essentially took control of WorldCom. Rakoff appointed former SEC chairman Richard C. Breeden to oversee WorldCom's compliance with the SEC agreement. Breeden actively involved himself with the management of the company, and prepared a report for Rakoff, titled Restoring Trust, in which he proposed extensive corporate governance reforms, as part of an effort to "cast the new MCI into what he hoped would become a model of how shareholders should be protected and how companies should be run".[23]

Post-bankruptcy

The company emerged from bankruptcy in 2004 with about $5.7 billion in debt and $6 billion in cash. About half of the cash was intended to pay various claims and settlements. Previous bondholders ended up being paid 35.7 cents on the dollar, in bonds and stock in the new MCI company. The previous stockholders' stock was cancelled.[24]

It had yet to pay many of its creditors, who had waited for two years for a portion of the money owed. Many of the small creditors included former employees, primarily those who were dismissed during June 2002 and whose severance and benefits were withheld when WorldCom filed for bankruptcy.

Citigroup settled with Worldcom investors for $2.65 billion on May 10, 2004.[25] In March 2007, 16 of WorldCom's 17 former underwriters reached settlements with investors.[26]

On March 15, 2005, Bernard Ebbers was found guilty of all charges and convicted of fraud, conspiracy and filing false documents with regulators — all related to the $11 billion accounting scandal. Other former WorldCom officials charged with criminal penalties in relation to the company's financial misstatements include former CFO Scott Sullivan (entered a guilty plea on March 2, 2004, to one count each of securities fraud, conspiracy to commit securities fraud, and filing false statements),[27] former controller David Myers (pleaded guilty to securities fraud, conspiracy to commit securities fraud, and filing false statements on September 27, 2002),[28] former accounting director Buford Yates (pleaded guilty to conspiracy and fraud charges on October 7, 2002),[29] and former accounting managers Betty Vinson and Troy Normand (both pleading guilty to conspiracy and securities fraud on October 10, 2002).[30]

On July 13, 2005, Bernard Ebbers received a sentence that would have kept him imprisoned for 25 years. At time of sentencing, Ebbers was 63 years old. On September 26, 2006, Ebbers surrendered himself to the Federal Bureau of Prisons prison at Oakdale, Louisiana, the Oakdale Federal Correctional Institution, to begin serving his sentence; he was released in late 2019 for health reasons and died in February 2020, after serving 13 years of his sentence.[31]

In December 2005, Microsoft announced a partnership with MCI to provide Windows Live Messenger customers voice over IP service to make telephone calls - called "MCI Web Calling".[32] After the merger with Verizon, this product was renamed "Verizon Web Calling".

In January 2006, the company was acquired by Verizon Communications and was later integrated into Verizon Business.[33]

Evidence timeline

1998 (Feb 12)

Full newspaper page - [HN01EP][GDrive]

MCI, WorldCom merger would become nation's largest

(Editor's Note: The following article concerning the proposed acquisition of MCI by WorldCom Inc., and its possible effect on the Internet, is condensed from two articles which were published in the January, 1998, edition of Boardwatch Magazine. Information from the articles by Editor/Publisher Jack Rickard and Copy Editor Bill McCarthy is reprinted with permission.)

The concept of an Internet monopoly was originally an oxymoron. There were a large number of networks, most notably universities and DOD contractors. If you interconnected them in cooperative fashion, for the exchange of data, you had an internet. And if it somehow connected to the NSFNet backbone after about 1986, it was on the capital "I" Internet.

Since the commercialization and privatization of the Internet - intended to end the government "monopoly" of the Internet - there has been approximately 1,400 Teramanhours spent by nearly everyone, but particularly telco types, in trying to devise a method to control or "own" the Internet. This can be terribly difficult with over 4,000 vendors in a competitive environment.

But the Internet is quite hierarchical. Almost all of the 4,470 ISPs we count in operation in the U.S. and Canada as of Dec. 1 get THEIR connection to the Internet from a relative handful of top-level backbone operators. And the distribution there is not very symmetrical either. These 4,470 ISPs, many of which sport more than one connection, have a total of 5,458 connections between them to backbones that we have some data on. MCI, Sprint and UUNET, together, provide 74 percent of those connections with about 30 backbones splitting up the rest.

And while the number of Internet service providers continues to grow, the number of national backbones they can connect to is beginning to shrink. GTE has purchased BBN and now Genuity. Even PSINet, which has struggled financially in the past two years despite continued growth, has now acquired Canadian backbone operator iSTAR.

But nothing in the history of business mergers in North America matches WorldCom's 12-year buying spree with its most significant deals, at least in terms of the Internet, coming in the past two years. In 1996, the company bought MFS Communications and UUNET Technologies, two of the biggest players in Internet traffic. In September, it bought CompuServe Network Services and ANS Communications, two of the largest and fastest backbones in the United States. And none of this includes what the company has been doing overseas, such as the recent purchase of the largest ISP in the Netherlands.

In a frenzied season of telcos shopping for each other, MCI Communications Corp. agreed Nov. 10 to be acquired by WorldCom Inc., after the telco that appears determined to buy the Internet sweetened its bid for MCI to $37 billion in stock and cash.

The new offer, raised to $51 a share from $41.50, will be paid in WorldCom stock to all shareholders other than British Telecommunications. BT, which holds a 20 percent stake in MCI, will receive $7.4 billion in cash. WorldCom, the number four long-distance phone company, also picks up $5 billion in MCI debt. With British Telecommunications cashing out, MCI shareholders will own about 45 percent of the new company, while WorldCom will have a 55 percent stake.

The actual number of shares of WorldCom common stock to be exchanged for each MCI share owned by investors other than BT will be determined by dividing $51 by the 20-day average of the high and low sales prices for WorldCom common stock prior to the closing, but will not be less than 1.2439 shares (if WorldCom's average stock price exceeds $41) or more than 1.7586 shares (if WorldCom's average stock price is less than $29).

Although the merger will take six to nine months to garner regulator approvals, Bernard J. Ebbers, president and chief executive officer of WorldCom, said there are "no issues that we can anticipate in even the worst circumstances that will derail this transaction."

The MCI WorldCom deal would surpass the largest U.S. merger so far, a $25.6 billion union of Bell Atlantic Corp. and Nynex Corp. that was completed in August.

Since its founding in 1968 and its revolutionary leadership in the breakup of Ma Bell, MCI has been reminiscent of the rebellious teenager who wakes up in his thirties to realize he has become his parent. Meanwhile, WorldCom seems to be busting out like a 16-year-old with the keys to the family car and high hopes of picking up some girls and beer.

MCI WorldCom will provide an interesting mesh of the executive staffs, starting at the top. During a news conference, Ebbers referred to Bert C. Roberts Jr., chairman of MCI, as "bossman," but few people in the business believe that Ebbers will actually take a back seat to Roberts. Upon completion of the merger, Roberts, currently chairman of MCI, will become chairman of MCI WorldCom. Ebbers will serve as president and chief executive officer of MCI WorldCom.

The merger agreement is subject to the approvals of MCI and WorldCom stockholders as well as approvals from the Federal Communications Commission, the Justice Department, which is preoccupied with desktop icons, and numerous state government bodies. In addition, the merger is subject to review by the European Commission.

What is next on WorldCom's shopping list? Ebbers said that executives will "focus our time" on the merger. But he added: "Entrepreneurs look for opportunities. If there are opportunities out there that make sense, we certainly will not shy away from them."

wow - MCi-Worldcom eventually failed due to a scandal, and were bought by verizon anyways!

See **GTE Corporation** .

GTE seeks to block WorldCom-MCI merger

■ Company says deal would crimp competition

By JEANNINE AVERSA
The Associated Press

WASHINGTON — GTE Corp. is suing in an effort to stop the big WorldCom-MCI merger, contending it would crimp competition and possibly raise prices in the Internet and long-distance businesses.

GTE, which itself made an unsuccessful bid for MCI last November, says the merger would violate antitrust laws. MCI says GTE is just worried about competition.

The lawsuit, filed late Thursday in federal court, raises the same points GTE has made to the Justice Department and other regulatory bodies that are investigating the $37 billion deal.

GTE general counsel William Barr said Friday the lawsuit was "a firewall," filed in case regulators do not stop the merger.

"While we believe that the enforcement agencies are going to do the right thing ... at the end of the day GTE has to be in the position to defend its interests if our concerns are not fully addressed," he said.

Under the merger, MCI-WorldCom would control between 40 percent and 60 percent of Internet traffic flowing on "backbones" in the United States, Barr said. GTE accounts for between 8 percent and 10 percent of such Internet backbone traffic, Barr said.

Internet backbones are high capacity networks that carry Internet and other data traffic.

"The merger will give MCI-WorldCom a stranglehold over the burgeoning Internet and the incentive and ability to stifle competition from all other rival Internet backbone operators, including GTE," the company said in its suit.

WorldCom and MCI reject rivals' allegations that the merger would lead to higher pricing in the Internet and long-distance businesses, MCI spokesman Frank Walter said.

"We think GTE's motive is clearly to keep us from competing more aggressively in the local phone market where GTE has a virtual monopoly," said Walter. "It is disingenuous for them to take the mantle of pro-competition when they preside over one of the largest telephone monopolies in the country."

Walter also said there are 40 major companies, including AT&T, Sprint and IBM, that provide Internet backbone services.

GTE's lawsuit also alleges that the merger will "substantially lessen competition in the highly concentrated wholesale and retail markets for long-distance services."

MCI is the nation's second-largest long-distance company and WorldCom is the fourth largest. WorldCom accounts for 40 percent of long-distance service sold to other companies at wholesale rates, GTE's lawsuit says.

Description

In late summer 1999, an outbreak of human encephalitis occurred in the northeastern United States that was concurrent with extensive mortality in crows (Corvusspecies) as well as the deaths of several exotic birds at a zoological park in the same area. Complete genome sequencing of a flavivirus isolated from the brain of a dead Chilean flamingo (Phoenicopterus chilensis), together with partial sequence analysis of envelope glycoprotein (E-glycoprotein) genes amplified from several other species including mosquitoes and two fatal human cases, revealed that West Nile (WN) virus circulated in natural transmission cycles and was responsible for the human disease. Antigenic mapping with E-glycoprotein–specific monoclonal antibodies and E-glycoprotein phylogenetic analysis confirmed these viruses as WN. This North American WN virus was most closely related to a WN virus isolated from a dead goose in …

1. SOUNDBITE (English) Doctor (Dr) John S. MacKenzie, Team leader and virologist from the University of Queensland in Australia: "We hope it will be very productive from both sides. From the global perspective - in terms of knowing more about SARS - but also from the more local perspective, shall we say, in terms of us providing whatever information we can, whatever help we can to our colleagues here in China."
2. Pan from Dr Meirion R. Evans, UK epidemologist (left) and Dr Wolfgang Preiser, German virologist to Dr Robert F Breiman, US Infectious disease specialist (left) and MacKenzie
3. SOUNDBITE (English) Dr John S. MacKenzie, Team leader and virologist from the University of Queensland in Australia: "We've had 27 suspected cases in Australia but it's only information of the sort we're getting now - I mean, like we've been getting for the last three weeks - that we've been able to say that those 27 suspect cases in Australia are not SARS. And sure they've travelled in the right place. Sure they've got atypical pneumonia but they're not SARS under the current case-definition. So to be able to find out what the best definition possibly is, is incredibly important."
4. SOUNDBITE (English) Dr Robert F Breiman, American Epidemiologist and Infectious disease specialist: "In the case of Legionnaires disease and (unclear) virus - and there have been many other emerging diseases - there is plenty of evidence that those diseases existed before. What's made it recognised is the actual clustering, it's the epidemic."
5. SOUNDBITE (English) Dr James H. Maguire, Chief of epidemiology, US National Centre for Infectious Diseases, Centres for Disease Control and Prevention: "It may be, it may not be but it may be that what we learn, what is learned here in China will provide the key. There may be issues here. The fact that if this was really the first location for where these diseases occurred, there may be some reasons why that happened here that I think are gonna be very interesting to explore."

STORYLINE: A team of World Health Organization (WHO) experts said on Monday they were analyzing the cases of Chinese sickened in an outbreak of a fatal flu-like illness in hopes of finding out whether it is linked to a mystery disease that has spread to three continents. The five-member team arrived on Sunday and said they would examine Chinese records this week. They said they had not decided whether to visit the southern province of Guangdong, where five deaths from atypical pneumonia were reported. WHO says it is treating the outbreaks as part of the same emergency that has killed 10 people in Hong Kong, two in Vietnam and two in Canada, though it isn't clear if the deaths were caused by severe acute respiratory syndrome, or SARS. Another 305 people also were sickened in Guangdong since the first cases were reported in November, Chinese health authorities say. The Chinese government didn't report the outbreak until February and its reluctance to release information fueled a panic in Guangdong and neighboring Hong Kong. People bought up supplies of antibiotics and vinegar for use as a disinfectant. Cases of SARS have also been confirmed in Europe.

Editorial

1st International One Health Congress

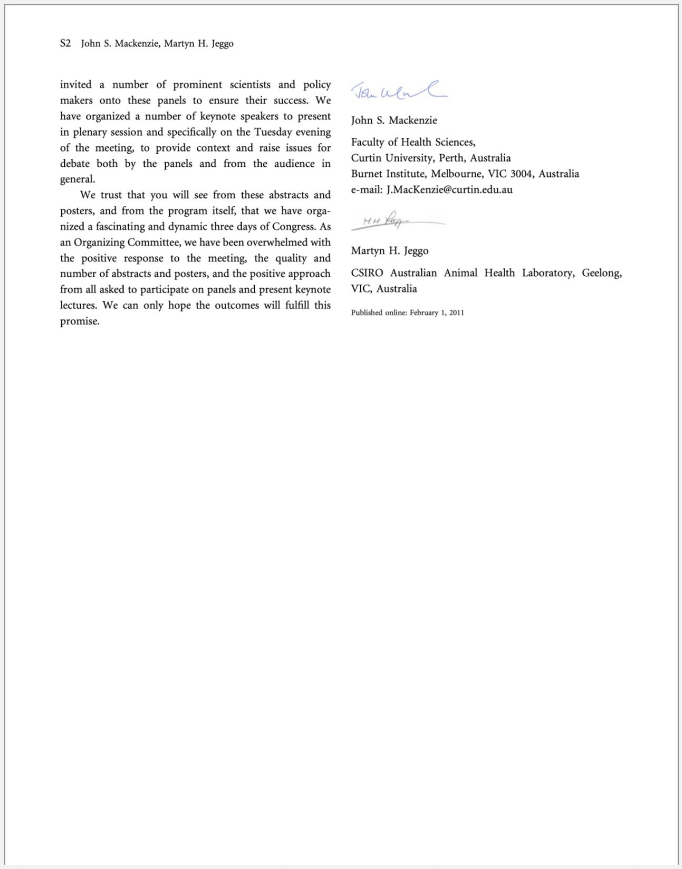
This supplemental edition of *EcoHealth* contains abstracts of the presentations and posters that will be given at the 1st International Congress on One Health being held in Melbourne, 14–16 February 2011.

The concept of One Health is not new but has been discussed for a number of years, and various meetings have been held on the subject. To date, however, all these have either been by invitation, had a very directed agenda, or have focused on specific elements of the One Health Concept. This 1st International Congress is open to all; wishes to address both the science and the policy issues; and includes not just infectious diseases as a discipline, but also the much broader issues of trade, food security and safety, and the impacts on the environment.

The One Health approach and the need to strengthen the cross-sectoral cooperation between the human and animal health community has been strongly endorsed by a number of national and international human and animal health organizations and at a series of international meetings over the past three to five years. In 2008, the three major international organizations charged with animal health and human health—FAO, OIE and WHO—collaborated with UNICEF, the UN System for Influenza Coordinator, and the World Bank to develop a joint strategic framework in response to the evolving risk of emerging and re-emerging infectious diseases. The document communicating this framework, 'Contributing to One World, One Health—A Strategic Framework for Reducing Risks of Infectious Diseases at the Animal-Human-Ecosystems Interface,' was officially released at the 6th International Ministerial Conference on Avian and Pandemic Influenza at Sharm-el-Sheikh in October 2008. A number of meetings have been held subsequently, the most recent international developments being (a) the Chatham House meeting report 'Shifting from Emergency Response to Prevention of Pandemic Disease Threats at Source'; (b) the document 'The FAO-OIE-WHO Collaboration: Sharing responsibilities and coordinating global activities to address health risks at the animal-human-ecosystems interfaces', which was endorsed by the Directors-General of the three organizations, and (c) the Hanoi Declaration at the International Ministerial Conference: "Animal and Pandemic Influenza: the Way Forward" in Hanoi, all of which occurred in April 2010. Two important international technical meetings have also been held, one hosted by the Canadian Government in Winnipeg in 2009, and the second in May 2010 by the US Centers for Disease Prevention and Control, both with the support of WHO, OIE and FAO, but importantly, in our view, these two meetings were by invitation only.

The purpose of the Melbourne meeting is to open the One Health debate to the wider international scientific and policy making community, particularly to the Asia Pacific countries where many of the risks emanate; to provide a forum for discussing these risks with respect to global health, trade, and food security; and to explore possible ways to better prepare and plan in order to prevent or mitigate future pandemic threats.

We are determined to achieve real outcomes from this meeting in terms of mapping forward One Health activities on a global basis and having Australia start to play a major role in achieving this. To this aim, we have organized a series of panel sessions during the meeting to debate the issues at hand and the way forward. We have



invited a number of prominent scientists and policy makers onto these panels to ensure their success. We have organized a number of keynote speakers to present in plenary session and specifically on the Tuesday evening of the meeting, to provide context and raise issues for debate both by the panels and from the audience in general.

We trust that you will see from these abstracts and posters, and from the program itself, that we have organized a fascinating and dynamic three days of Congress. As an Organizing Committee, we have been overwhelmed with the positive response to the meeting, the quality and number of abstracts and posters, and the positive approach from all asked to participate on panels and present keynote lectures. We can only hope the outcomes will fulfill this promise.

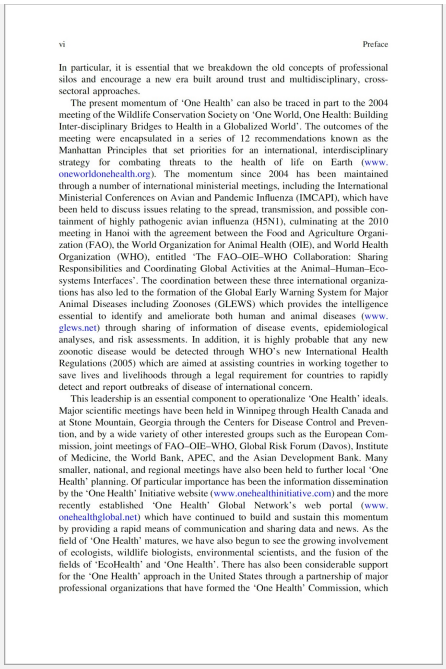
Preface

Global health security has become a major international concern. Our population faces imminent threats to human and animal health from the emergence and re-emergence of epidemic-prone infectious diseases, linked to the significant impact that these outbreaks are already having on national and international economies. The concept and drivers of disease emergence were clearly documented 20 years ago in the Institute of Medicine's seminal 1992 report, *Emerging Infections: Microbial Threats to Health in the United States*. (www.nap.edu/catalog.php?record_id=2008). This volume described the mechanisms leading to infectious disease emergence and highlighted possible strategies for recognizing and counteracting the threats. It has long been known that many of these diseases can cross the species barrier between humans, wildlife, and domestic animals; and indeed over 70 % of novel emerging infectious diseases are zoonotic, that is, they have their origins in animal reservoirs. There have been many examples of this since the Institute of Medicine's report two decades ago, including the emergence of H1N1 pandemic influenza virus, the SARS coronavirus, Nipah and Hendra viruses, Australian bat lyssavirus, Malaka virus, and avian influenza H5N1, to name but a few.

These diseases remind us that the health of humans, animals, and ecosystems are interconnected, and that to better understand and respond rapidly to zoonotic diseases at the human–animal–environment interfaces requires coordinated, collaborative, multidisciplinary, and cross-sectoral approaches. This holistic approach has been referred to as 'One Health', indicative of the commonality of human and animal medicine, and their connection to the environment. Although the concept is not new, 'One Health' has gained added momentum in the aftermath of the SARS epidemic of 2003 which posed the first major threat to human health and global economy of the new millennium. These concerns added to the mounting fears that highly pathogenic avian influenza H5N1 could develop into the next severe influenza pandemic. Not only would such a pandemic lead to significant mortality and morbidity, but the World Bank has estimated that it could cause a decline of up to 5% of global GDP (damages of US$3 trillion), causing far-reaching disruptions in the lives of people, communities, and countries. There are currently other potential threats from the new SARS-like coronavirus and H7N9 avian influenza virus. Thus there are compelling reasons to develop new approaches that will improve the detection, prevention, and control of zoonotic diseases.

v



vi Preface

In particular, it is essential that we breakdown the old concepts of professional silos and encourage a new era built around trust and multidisciplinary, cross-sectoral approaches.

The present momentum of 'One Health' can also be traced in part to the 2004 meeting of the Wildlife Conservation Society on 'One World, One Health: Building Inter-disciplinary Bridges to Health in a Globalized World'. The outcomes of the meeting were encapsulated in a series of 12 recommendations known as the Manhattan Principles that set priorities for an international, interdisciplinary strategy for combating threats to the health of life on Earth (www.oneworldonehealth.org). The momentum since 2004 has been maintained through a number of international ministerial meetings, including the International Ministerial Conferences on Avian and Pandemic Influenza (IMCAPI), which have been held to discuss issues relating to the spread, transmission, and possible containment of highly pathogenic avian influenza (H5N1), culminating at the 2010 meeting in Hanoi with the agreement between the Food and Agriculture Organization (FAO), the World Organization for Animal Health (OIE), and World Health Organization (WHO), entitled 'The FAO–OIE–WHO Collaboration: Sharing Responsibilities and Coordinating Global Activities at the Animal–Human–Ecosystems Interfaces'. The coordination between these three international organizations has also led to the formation of the Global Early Warning System for Major Animal Diseases including Zoonoses (GLEWS) which provides the intelligence essential to identify and ameliorate both human and animal diseases (www.glews.net) through sharing of information of disease events, epidemiological analyses, and risk assessments. In addition, it is highly probable that any new zoonotic disease would be detected through WHO's new International Health Regulations (2005) which are aimed at assisting countries in working together to save lives and livelihoods through a legal requirement for countries to rapidly detect and report outbreaks of disease of international concern.

This leadership is an essential component to operationalize 'One Health' ideals. Major scientific meetings have been held in Winnipeg through Health Canada and at Stone Mountain, Georgia through the Centers for Disease Control and Prevention, and by a wide variety of other interested groups such as the European Commission, joint meetings of FAO–OIE–WHO, Global Risk Forum (Davos), Institute of Medicine, the World Bank, APEC, and the Asian Development Bank. Many smaller, national, and regional meetings have also been held to further local 'One Health' planning. Of particular importance has been the information dissemination by the 'One Health' Initiative website (www.onehealthinitiative.com) and the more recently established 'One Health' Global Network's web portal (www.onehealthglobal.net) which have continued to build and sustain this momentum by providing a rapid means of communication and sharing data and news. As the field of 'One Health' matures, we have also begun to see the growing involvement of ecologists, wildlife biologists, environmental scientists, and the fusion of the fields of 'EcoHealth' and 'One Health'. There has also been considerable support for the 'One Health' approach in the United States through a partnership of major professional organizations that have formed the 'One Health' Commission, which

Influenza virus infection has probably shaped human populations for centuries, if not millennia. Novel influenza viruses formed by genetic reassortment of avian and mammalian viruses emerge sporadically and, if they have the necessary infectivity and transmissibility in humans, spread rapidly around the globe causing a pandemic. While mortality and morbidity varied widely between the pandemics of the last century, the loss of an estimated 50 million lives in the most devastating pandemic of 1918–1919 has had a lasting global impact. Here we briefly review the history and effects of influenza pandemics on the global human population and events of the time. Then we discuss some of the ways in which the experience of the 1918–1919 and later pandemics has influenced development of international influenza surveillance and global public health policy, the full impact of which will become apparent in future pandemics.

Early history of influenza

Influenza viruses evolved in aquatic birds. They remain there in a number of antigenically diverse forms as an enzootic reservoir[1] from which they occasionally cross into and become established in other species, including humans. Swine and horses are known to have been infected with avian influenza viruses and suggested as intermediate hosts for introduction to humans[1,2]. Their domestication together with that of ducks, thousands of years ago, could have provided opportunities for repeated introductions into humans.

Outbreaks of human influenza have been chronicled from the late Middle Ages in Europe and Britain, and although outbreaks as early as the 5th century in Greece have been described by some historians, most believe that descriptions predating 1520, and possibly later, should be treated with caution[3,4]. Many of these outbreaks were accompanied by high morbidity and sometimes mortality. However, it is unclear whether any of those recorded in the pre-Elizabethan period shaped world history although influenza reputedly contributed to the demise of Oliver Cromwell[2]. A possible exception to this was the suggestion that influenza was introduced to the Americas by Columbus's second voyage in 1492, and was the first of the Old World diseases to depopulate indigenous peoples in Hispaniola and beyond with many hundred thousand deaths[5]. Although this has been questioned, it seems probable that influenza contributed to the depopulation of the New World and other remote, immunologically naive communities including French Polynesia[6]. Similarly, the first recorded influenza outbreak in Australia in 1820 severely affected the indigenous population[7].

A disproportionate impact on indigenous populations in Australia[8], New Zealand[9] and elsewhere[10] persists to this day.

Pandemic influenza: the 1918–1919 pandemic

We now know that recent, and presumably previous, influenza pandemics involved viruses bearing surface antigens, haemagglutinin (H) and neuraminidase (N), to which most or all of the population lacked immunity. These surface antigen genes originate from the avian influenza gene pool, by adaptation or genetic reassortment with circulating human or animal influenzas, thus acquiring the ability to infect and be serially transmitted in humans. Spread is global and rapid, with high morbidity and often high mortality. The new pandemic virus then persists for decades as a seasonal infection by virtue of exceptional mutability.

Although numerous epidemics with significant morbidity and mortality occurred from the 16th century it is generally agreed that the first recorded outbreak meeting pandemic criteria is that of 1580 followed by those commencing in 1729, 1781, 1830 and 1889[3,4]. The pandemic of 1918–1919 was the most deadly influenza pandemic recorded with a recent estimate of 50 million or more deaths[11]. The pandemic was inextricably intertwined with World War I. It influenced the capacity to conduct hostilities[12] while its evolution may have been influenced by crowded conditions and soldiers' exposure to toxic gases[13]. Remarkably the genetic blueprint of the H1N1 pandemic virus has been determined and the virus reconstructed[14]. Nevertheless, unanswered questions remain: how and where the virus evolved and reasons for the unusual age distribution of deaths and usually three distinct waves of differing pathogenicity.

Mortality varied across countries with sparing attributed to affluence[15] and delayed introduction achieved by maritime quarantine[16]. Australia, where introduction was delayed until March 1919, had one of the lowest mortality rates, particularly in Tasmania[16]. Undoubtedly the pandemic had enormous social and economic impact in most societies but most attention was given to elucidating its cause, mode of transmission and toll, rather than to its social and cultural dimensions or consequences. It may never be possible to disentangle these from the consequences of the war. In Australia, where it stressed relations between the states, it was a catalyst for formation of the Commonwealth Department of Health[17]. There is, however, the intriguing possibility of one huge historical consequence. US president Woodrow Wilson suffered severe influenza absenting him from much of the WW1 armistice negotiations. This resulted in Britain and France imposing severe punitive conditions on Germany in the Treaty of Versailles which may have facilitated the rise to power of Adolf Hitler[18].

The virologic era

Influenza viruses were first isolated in the early 1930s, and shortly afterwards the first inactivated virus vaccines were produced and used by the allied forces in the Second World War. In 1947, a major antigenic change in the circulating Type A viruses resulted in vaccine failures. This kindled fears of another influenza pandemic like 1918–1919 and was a driver for an informal meeting of influenza experts during the 4th International Congress of Microbiology in Copenhagen in July 1947. They recommended to the Interim Commission of the World Health Organization (WHO) that an international surveillance program for influenza be initiated. Following adoption by WHO in September 1947, a World Influenza Centre was established at the National Institute for Medical Research, London, to work with regional laboratories and, later, national centres to study epidemiology and isolate new influenza strains[19]. In Australia, the Commonwealth Serum Laboratories were designated as a Regional Influenza Centre in 1951, upgraded to Collaborating Centre in 1992, until 2006 when the responsibility for the Centre was transferred to the Victorian Infectious Diseases Reference Laboratory. Today, there are 141 national centres in 101 countries and six WHO Collaborating Centres for Influenza in London, Atlanta, Melbourne, Beijing, Tokyo and Memphis, the latter concerned with the Ecology of Influenza in Animals. The efficacy of the network in surveillance was demonstrated during the 1957 and 1968 pandemics and the re-emergence of H1N1 in 1977[20].

The pandemics of 1957 (Asian) and 1968-69 (Hong Kong) were far milder than that of 1918–1919. The first was moderately severe globally and spread quickly, reaching Australia within 3 months of its origin in China[21], while the second was a 'smouldering' pandemic and had a delayed peak in many countries including Australia in 1970[22]. In addition to demonstrating the difficulty in producing vaccine in the necessary timeframe[23], these pandemics provided the viruses which allowed elucidation of the origins of pandemic viruses.

The Fort Dix episode

In 1976 a small influenza outbreak occurred among military recruits at Fort Dix, New Jersey, with severe respiratory disease in 13 soldiers and one death. The outbreak involved a combination of H3N2 virus and a virus related to early swine-like H1N1 strains derived from the 1918–1919 pandemic[24]. Concerned that it might signal a re-introduction of a 1918 pandemic-like virus, and in a divisive decision, the US Government planned to immunise the whole country; scientific and medical evidence did not support the decision. The program was stopped after an epidemiologic association between vaccination and increased incidence of Guillain-Barré Syndrome was

Influenza virus infection has probably shaped human populations for centuries, if not millennia. Novel influenza viruses formed by genetic reassortment of avian and mammalian viruses emerge sporadically and, if they have the necessary infectivity and transmissibility in humans, spread rapidly around the globe causing a pandemic. Early history of influenza

Influenza viruses evolved in aquatic birds. They remain there in a number of antigenically diverse forms as an enzootic reservoir1 from which they occasionally cross into and become established in other species, including humans. Swine and horses are known to have been infected with avian influenza viruses and suggested as intermediate hosts for introduction to humans1,2. Their domestication together with that of ducks, thousands of years ago, could have provided opportunities for repeated introductions into humans.

Outbreaks of human influenza have been chronicled from the late Middle Ages in Europe and Britain, and although outbreaks as early as the 5th century in Greece have been described by some historians most believe that descriptions predating 1520, and possibly later, should be treated with caution3,4. Many of these outbreaks were accompanied by high morbidity and sometimes mortality. However, it is unclear whether any of those recorded in the pre-Elizabethan period shaped world history although influenza reputedly contributed to the demise of Oliver Cromwell2. A possible exception to this was the suggestion that influenza was introduced to the Americas by Columbus's second voyage in 1492, and was the first of the Old World diseases to depopulate indigenous peoples in Hispaniola and beyond with many hundred thousand deaths5. Although this has been questioned, it seems probable that influenza contributed to the depopulation of the New World and other remote, immunologically naive communities including French Polynesia6. Similarly, the first recorded influenza outbreak in Australia in 1820 severely affected the indigenous population7. A disproportionate impact on indigenous populations in Australia8, New Zealand9 and elsewhere10 persists to this day.

Pandemic influenza: the 1918–1919 pandemic

We now know that recent, and presumably previous, influenza pandemics involved viruses bearing surface antigens, haemagglutinin (H) and neuraminidase (N), to which most or all of the population lacked immunity. These surface antigen genes originate from the avian influenza gene pool, by adaptation or genetic reassortment with circulating human or animal influenzas, thus acquiring the ability to infect and be serially transmitted in humans. Spread is global and rapid, with high morbidity and often high mortality. The new pandemic virus then persists for decades as a seasonal infection by virtue of exceptional mutability.

Although numerous epidemics with significant morbidity and mortality occurred from the 16th century it is generally agreed that the first recorded outbreak meeting pandemic criteria is that of 1580 followed by those commencing in 1729, 1781, 1830 and 18893,4. The pandemic of 1918–1919 was the most deadly influenza pandemic recorded with a recent estimate of 50 million or more deaths11. The pandemic was inextricably intertwined with World War I. It influenced the capacity to conduct hostilities12 while its evolution may have been influenced by crowded conditions and soldiers' exposure to toxic gases13. Remarkably the genetic blueprint of the H1N1 pandemic virus has been determined and the virus reconstructed14. Nevertheless, unanswered questions remain: how and where the virus evolved and reasons for the unusual age distribution of deaths and usually three distinct waves of differing pathogenicity.

Mortality varied across countries with sparing attributed to affluence15 and delayed introduction achieved by maritime quarantine16. Australia, where introduction was delayed until March 1919, had one of the lowest mortality rates, particularly in Tasmania16. Undoubtedly the pandemic had enormous social and economic impact in most societies but most attention was given to elucidating its cause, mode of transmission and toll, rather than to its social and cultural dimensions or consequences. It may never be possible to disentangle these from the consequences of the war. In Australia, where it stressed relations between the states, it was a catalyst for formation of the Commonwealth Department of Health17. There is, however, the intriguing possibility of one huge historical consequence. US president Woodrow Wilson suffered severe influenza absenting him from much of the WW1 armistice negotiations. This resulted in Britain and France imposing severe punitive conditions on Germany in the Treaty of Versailles which may have facilitated the rise to power of Adolf Hitler18.

The virologic era

Influenza viruses were first isolated in the early 1930s, and shortly afterwards the first inactivated virus vaccines were produced and used by the allied forces in the Second World War. In 1947, a major antigenic change in the circulating Type Aviruses resulted in vaccine failures. This kindled fears of another influenza pandemic like 1918–1919 and was a driver for an informal meeting of influenza experts during the 4th International Congress of Microbiology in Copenhagen in July 1947. They recommended to the Interim Commission of the World Health Organization (WHO) that an international surveillance program for influenza be initiated. Following adoption by WHO in September 1947, a World Influenza Centre was established at the National Institute for Medical Research, London, to work with regional laboratories and, later, national centres to study epidemiology and isolate new influenza strains19. In Australia, the Commonwealth Serum Laboratories were designated as a Regional Influenza Centre in 1951, upgraded to Collaborating Centre in 1992, until 2006 when the responsibility for the Centre was transferred to the Victorian Infectious Diseases Reference Laboratory. Today, there are 141 national centres in 101 countries and six WHO Collaborating Centres for Influenza in London, Atlanta, Melbourne, Beijing, Tokyo and Memphis, the latter concerned with the Ecology of Influenza in Animals. The efficacy of the network in surveillance was demonstrated during the 1957 and 1968 pandemics and the re-emergence of H1N1 in 197720.

The pandemics of 1957 (Asian) and 1968-69 (Hong Kong) were far milder than that of 1918–1919. The first was moderately severe globally and spread quickly, reaching Australia within 3 months of its origin in China21, while the second was a 'smouldering' pandemic and had a delayed peak in many countries including Australia in 197022. In addition to demonstrating the difficulty in producing vaccine in the necessary timeframe23, these pandemics provided the viruses which allowed elucidation of the origins of pandemic viruses.

The Fort Dix episode

In 1976 a small influenza outbreak occurred among military recruits at Fort Dix, NewJersey, with severe respiratory disease in 13 soldiersand one death. The outbreak involved a combination of H3N2 virus and a virus related to early swine-like H1N1 strains derived from the 1918–1919 pandemic24. Concerned that it might signal a re-introduction of a 1918 pandemic-like virus, and in a divisive decision, the US Government planned to immunise the whole country; scientific and medical evidence did not support the decision. The program was stopped after an epidemiologic association between vaccination and increased incidence of Guillain-Barré Syndrome was reported, something which has not been significant in subsequent surveillance25. The incident prompted the beginnings, in 1978, of formal pandemic preparedness planning by the USA and a handful of other countries, although WHO did not release its first pandemic planning document until 1999.

Avian influenza and recent pandemic concerns

The 1950s discovery that fowl plague was due to an influenza A virus, followed by the isolation of many additional avian influenza viruses, revealed the role of birds as a virus reservoir and the multiplicity of virus subtypes. H7 (responsible for fowl plague) and H5 can be highly pathogenic in domestic poultry, with exceptionally high mortality, and outbreaks of both subtypes have been recorded around the world, including Australia, since the 1950s26. Before 1997, recorded transmission of avian influenza to humans was rare, restricted to H7 viruses and almost always mild27.

In 1997, 18 H5N1 cases in humans with 6 deaths signalled poultry infections in Hong Kong. Culling appeared to stamp out the virus; however it reappeared in Thailand and Vietnam in 2003, and has since spread widely in birds and caused over 660 human cases with morethan 390 deaths across 16 countries28. Global concern over the pandemic potential of H5N1, so soon after SARS, reinvigorated pandemic planning nationally and internationally. An International Partnership on Avian and Pandemic Influenza was forged at a highlevel Plenary Meeting of the United Nations (UN) General Assembly in 2005, and the UN Secretary-General, Kofi Annan, subsequently pledged that theUNwould do all it could to ensure all countries, rich and poor, were protected and prepared for an avian influenza pandemic. A UN Systems Coordinator for Avian and Human Influenza (UNSIC) was appointed and International Ministerial Conferences on Avian and Pandemic Influenza (IMCAPI) were convened. These provided the impetus for a global response to emerging diseases and a One Health approach to manage zoonotic diseases29. In Australia, the National Action Plan forHumanInfluenza Pandemic and the Australian Health Management Plan for Pandemic Influenza have continued to be refined30,31.

Strain sharing: a new challenge for international collaboration

The H5N1 zoonotic also prompted the Government of Indonesia in 2006 to raise an issue of international equity. Developing countries share potential pandemic influenza viruses, such as A(H5N1), with WHO to support the development of vaccines and other interventions but cannot afford to purchase those products for the protection of their own people. Indonesia stopped sending H5N1 viruses to international WHO laboratories in protest. Several other countries lent their support to the campaign.

In response, WHO convened a series of technical, intergovernmental and working group meetings between 2007 and 2011. Discussions were technically, legally and politically complex, spanning influenza virology, commercial vaccine development and production, intellectual property, and sovereign rights of nations over their biological materials32. Ultimately, the meetings produced a new framework, the Pandemic Influenza Preparedness Framework for sharing of influenza viruses and access to vaccines and other benefits, adopted by the World Health Assembly in 201133,34, a crucial feature of which is the sharing of vaccines, antiviral drugs and other benefits through donations and financial contributions to WHO by manufacturers.

Implementation of the Framework faces challenges, including the use of genetic approaches to vaccine development that bypass the need to share the viruses themselves. Regardless, the Framework has embedded the principle of equity in the activities of theWHO's Global Influenza Surveillance and Response System. The true test will come with the next pandemic.

First pandemic of the 21st century

In March 2009 a respiratory outbreak in Mexico was caused by a reassortant swine H1N1 virus more closely related to pre-1950s viruses than to recent strains. With initial indications of high mortality in Mexico and rapid spread through North America and beyond, the WHO issued escalating alerts until 11 June when a pandemic was declared. Many countries, including Australia, had already activated their pandemic plans and placed orders for many millions of doses of vaccine. In retrospect mortality was well below the early indications from Mexico and, while virus spread and major target groups were generally similar to previous pandemics, overall impact was moderate. Vaccine availability again lagged behind the peak of the outbreak, invigorating efforts to develop "universal" influenza vaccines that will protect against diverse subtypes, as well as novel delivery systems and faster production processes35. There were allegations that the WHO and national responses had been unduly influenced by commercial interests and it became clear that planning documents lacked the flexibility to tailor responses according to ongoing assessment of severity36. While these issues have been largely addressed, pandemic preparedness and public support may have been damaged37.

The next pandemic

Today, H5N1 remains widespread in poultry and human infections continue. This large family of viruses has diversified genetically and antigenically, to the extent that a single vaccine would not protect against all circulating strains. In some H5N1 strains, only a few further mutations may enable respiratory droplet transmission between mammals38.

In 2013, a new threat emerged with human infections (>440) and deaths (>120) due to a novel H7N9 avian influenza in China39. Although this virus, unlike H5N1, causes a silent infection in poultry, human infections are strongly associated with exposure to live bird markets. These viruses have several features of adaptation to mammalian infection.

Although these and other novel influenza viruses pose a continuing pandemic risk, China's response to H7N9 exemplifies the benefits of the international networks and frameworks developed as a result of the 1918–1919 pandemic and later events outlined here. Early announcement of the outbreak, sharing of sequences and viruses, and openness about the epidemiology enabled rapid preparation of diagnostic reagents and candidate vaccine viruses by WHO laboratories and early interventions to limit spread. While sporadic influenza pandemics are an inevitable companion tohumanhistory, such international cooperation is the key to minimising their future impact on its course.

Professor John Mackenzie

Adjunct Professor of Tropical at Curtin University, Western Australia, Perth, Australia, and part-time Senior Medical Scientist-in-Charge at PathWest, Perth

Professor John Mackenzie is an Honorary Professor at the University of Queensland and Honorary Senior Principal Fellow at the Burnet Institute, Melbourne. He was formerly Professor of Microbiology and Adjunct Professor of Tropical Infectious Diseases at the University of Queensland.
He received his PhD in 1969 from the Australian National University where he worked with Professor Frank Fenner and Dr Robert Webster. He was then a faculty member at the University of Western Australia for 22 years, working principally on influenza and mosquito-borne viral diseases.
He was elected Secretary-General of the International Union of Microbiological Societies (IUMS) from 1999 to 2005, Fellow of the American Academy of Microbiology, and is a Past President of the Australian Society for Microbiology and the Asia-Pacific Society for Medical Virology. In 2002, he was appointed as Officer in the Order of Australia for services to public health research and to education, and in 2005, he was the inaugural recipient of the Academy of Science Malaysia's Mahathir Science Award for Excellence in Tropical Research. He was elected to Fellowship of the Australian Academy of Technological Sciences and Engineering in 2015.
He serves on a number of international committees with the World Health Organization (WHO) and other Non-Government Organizations. He is a member of the IHR Roster of Experts, and is currently a member of the Emergency Committee for Polio. He served as Chair of the IHR Emergency Committee for Influenza H1N1.He had previously served as a member of the steering committee of the Global Outbreak Alert and Response Network (GOARN) and a member of the Technical Advisory Group of the WHO Asia-Pacific Strategy for Emerging Diseases.
His recent major research interests have been in mosquito-borne virus diseases (particularly the ecology of Flaviviruses) and in emerging zoonotic viruses, and he has published over 300 major papers and research chapters on these and other research topics concerned with human and animal viral diseases. He has also been closely involved with the One Health concept and helped establish the One Health Platform foundation.
Professor MacKenzie is a member of the IHR Emergency Committee concerning ongoing events and context involving transmission and international spread of poliovirus. He is also member of the IHR Emergency Committee concerning Influenza Pandemic (H1N1) 2009.

About the Special Issue Editors

John S. Mackenzie, Professor, AO, FTSE, is an Emeritus Professor at Curtin University in Perth, Western Australia, where he held a Chair in Tropical Infectious Diseases. He is currently a part-time Senior Research Scientist at PathWest, Perth; an Honorary Professor in the School of Chemistry and Molecular Biosciences at the University of Queensland, St Lucia; and an Honorary Senior Principal Fellow at the Burnet Institute, Melbourne.

He has worked extensively with WHO, and particularly with the Global Outbreak Alert and Response Network, and the Asia Pacific Strategy for Emerging Infectious Diseases. He is a member of the Roster of Experts of the International Health Regulations. In 2009–2010, he was appointed as Chair of a WHO International Health Regulations Emergency Committee for Pandemic H1N1 influenza, and is currently a member of the International Health Regulations Emergency Committee Concerning the International Spread of Wild Poliovirus.

With his colleague, Prof. Martyn Jeggo, Mackenzie initiated the International One Health Congresses and helped to organize the first and fourth congresses in Melbourne. In 2015, he co-founded the One Health Platform Foundation with his colleagues Ab Osterhaus and Chris Vanlangendonck. The platform is a non-profit international foundation based in Belgium (www.onehealthplatform.com), and is responsible for the biennial World One Heath Congresses and the One Health Strategic Policy Forums.

Martyn Jeggo, Professor, BVetMed, FTSE, qualified as veterinary surgeon in the UK in 1972, and after a short four-year spell in general practice, has worked in research and the research management of infectious diseases. This included spells in a number of developing countries, at the UK high containment laboratory, and within the United Nations (UN). During this period of 18 years at the UN, he managed programs of support for animal health in the developing world, with research-related projects in some 150 countries. One such program involved support to laboratories in 40 countries and assisting in the global eradication of rinderpest. For this work, he was awarded a UN medal. In 2002, he became Director of the Australian Animal Health Laboratory and, as such, was a member of the Australian Animal Health Committee and Chair of SCHALS. In 2013, he retired from AAHL and now works on a part-time basis within the framework of the Geelong Centre for Emerging Infectious Diseases—a One Health consortium. He is Chair of the Governing Board of AUSGEM (a research partnership between UTS and EMAI, NSW), on the Board of the International Livestock Research Institute (ILRI), the Advisory Board of GALMED, and the International Advisory Board of SACIDS. For a number of years now, he has adopted a One Health approach to tackling a number of health research areas and along with Professor Mackenzie, has published a number of papers and books detailing the development and use of the One Health concept.

Zoonoses

John S Mackenzie and David Williams

The selection of papers included in this issue of *Microbiology Australia* present a broad brush of zoonotic diseases, from those known or described in ancient times such as rabies, first described in the Eshnunna cuneiform law tablets from ancient Mesopotamia dating back to the 18th–19th centuries BC[1], and glanders, thought to be first described in donkeys by Aristotle in Ancient Greece in 420–450 BC[2] and subsequently by the Romans[3], to some discovered or recognised as zoonotic within the past 30 years, such as the recently described zoonotic bat-borne pathogens in Australia, and *Clostridium difficile*, only recently recognised as a zoonotic pathogen. The selection of papers also demonstrates the wide range of zoonotic origins, including arthropod-borne viruses and potentially seafood-borne parasites.

More than 60% of human infectious diseases are caused by pathogens shared with wild or domestic animals[4], and over 75% of emerging diseases are zoonotic in origin. Over the past few decades, an increasing number of infectious diseases have jumped the species barrier from animals to humans to cause disease, and in many instances have subsequently spread regionally and/or globally. Most of these have been viruses jumping from wildlife to humans, as exemplified by HIV/AIDS in the 1980s originating from the great apes possibly as early as the 1920s[5]; Sin Nombre virus, recognised as a cause of hantavirus pulmonary syndrome in 1993, originating from the deer mouse (*Peromyscus maniculatus*)[6]; Nipah virus in 1998–99 originating from bats via pigs[7]; severe acute respiratory syndrome coronavirus (SARS-CoV) in 2002–03 originating from bats via civets[8,9]; Middle East respiratory syndrome coronavirus (MERS-CoV) in 2012 from dromedary camels, but probably originating from bats more than 30 years previously[10]; and currently, the novel coronavirus, SARS-CoV-2, almost certainly originating from bats and probably via an as yet unknown intermediary host, such as pangolins. Other important emerging diseases have jumped from domesticated species, such as pandemic influenza H1N1 originating from pigs in 2009.

What precipitates the cross-species jump, and what can be done to prevent or mitigate it? Much of the recent increase in the emergence and spread of zoonoses can be linked to environmental and societal changes that have brought people and wild and/or domesticated animals closer together, increasing the potential for cross-species transmission. Environmental factors and climate change are altering the habitats of animals or arthropod vectors of zoonoses, changing how and where they live. Anthropogenic factors have changed the interactions between humans and their domestic animals through intensive agriculture and altered land use; and with the need to seek meat for human consumption, there has been increased hunting of wild animals for bushmeat. As cities have expanded and new population centres emerged, there has been increasing encroachment into wildlife habitats. In addition, increased city living and expanding metropolitan areas are providing new homes for a variety of wildlife, from rats and mice to foxes, birds, fruit bats, wallabies, bandicoots, possums, and other small marsupials in Australia, which can live off the plentiful food supply we discard or which are available in parks and gardens, and in additional green areas[4,11]. In other countries, many local wildlife species are commonly making their homes in cities, including monkeys, squirrels, mongooses and raccoons. Underscoring this is that 'synanthropic' mammal species, those wildlife species that adapt well in human-modified environments, are 15 times more likely to be the source of emerging infectious diseases[12]. As pathogens evolve and emerge, transmission of zoonotic infections and outbreaks have occurred because of the everyday practices of people. This often involves the chain of activities in livestock production, such as intensive growing, breeding, transport, slaughter and sale of animals. In many countries, live ('wet') animal markets where several species of domestic or wild animals may be caged in close proximity have been the origins of zoonoses. The interactions of people with wildlife areas for recreational purposes such as hunting, hiking and camping, also lead to zoonotic transmission of pathogens.

Lessons should have been learnt from some of the emergent zoonoses over the past few decades, but despite major outbreaks

Guest **Editorial**

of disease, the memories and messages seem to fail to resonate. The outbreak of SARS in 2002–03 was clearly associated with transmission from live wild animals in the wet markets of Guangdong. Despite strong recommendations that these markets be stopped because of the risks they pose of potential human transmission, they continue to flourish selling poultry and wild and often exotic animals, often illegally (a temporary ban on the trade in wild animals was introduced from 26 January 2020 by the Chinese Government). The same problem exists in the trade and export of bushmeat in Africa. While it is unlikely that the bushmeat trade will be halted in Africa as it provides a much-needed source of dietary protein, export of bushmeat to Europe, US and elsewhere provides an ongoing risk of disease including Ebola, Marburg and other exotic diseases[13–15]. The amount of bushmeat exported is in surprisingly large amounts, measured in tonnes/airport/year rather than kilograms.

Another recommendation that has not been sufficiently heeded is the need to incorporate surveillance of wildlife disease outbreaks into national and global disease surveillance programs. In Australia, a surveillance system has been implemented to detect outbreaks in free-living wildlife, and the information fed into coordination mechanisms that exist between animal health and public health[16], and similar systems are in place in the United States and the UK. Wildlife disease surveillance is not well resourced or well reported in many countries, and a concerted and cooperative push is urgently needed to develop improved wild animal disease surveillance mechanisms, especially in resource-poor countries.

Understanding the drivers of human behaviours that lead to the emergence or re-emergence of zoonoses, not just the behaviours themselves, will be equally important to enable comprehensive disease control and mitigation strategies to be put in place. Fundamental to this will be the commitment and support of relevant government departments and industry groups within an affected country to resource zoonotic disease control and prevention through the combined efforts of the human health, livestock and wildlife sectors. Continued efforts to identify potential zoonoses through initiatives such as the USAID Expanded Pandemic Threats program will also be another key element to zoonotic disease preparedness. Closer to home, in Australia, zoonotic disease risks are well recognised, and it will be important for those involved in zoonotic disease diagnosis, research, surveillance and response to remain vigilant and vocal about the ongoing threat they pose. Continued and expanded support for the disease control capabilities of our neighbours in the Pacific and Southeast Asia will also pay dividends for pre-border disease mitigation with the dual benefit of addressing zoonotic disease threats in-country and potentially reducing the importation or spread of pathogens into Australia via people or animals/animal products.

It has been estimated that zoonoses cause about a billion cases of illness in people and millions of deaths every year, and emerging zoonoses are a rising threat to global health, having caused hundreds of billions of US dollars of economic damage over the past 30 years[4]. With the current emergence of the novel coronavirus in China now threatening to develop into a global pandemic, this should surely raise enough concern for a concerted effort to reduce potential opportunities for future zoonosis emergence, using One Health approaches.

Professor John S Mackenzie

Emeritus Professor John S Mackenzie, Faculty of Health Sciences, Curtin University, Perth, Australia

Professor John Mackenzie is Emeritus Professor at Curtin University in Perth, Western Australia. He is an Honorary Professor in the School of Chemistry and Molecular Biosciences at The University of Queensland, and Honorary Senior Principal Fellow at the Burnet Institute, Melbourne, He is currently a part-time Senior Research Scientist at PathWest in Perth.

He was Director of the WHO Collaborating Centre for the Collection and Dissemination of Data on Virus Diseases of SE Asia and the Western Pacific from 1984 to 1994. He was a member of the steering committee of the Global Outbreak Alert and Response Network from 2002-2016 (Chair in 2009-10), and the Asia-Pacific Strategy for Emerging Diseases. He chaired the WHO IHR Emergency Committee for Pandemic H1N1 influenza in 2009-10 and is currently a member of the Emergency Committee for Poliovirus. In 2003-04 he worked at WHO to support post-SARS response efforts. He had earlier led a mission into China investigating the origin of SARS in March 2003 and was a member of the WHO Indian Ocean Tsunami response team in Aceh.

He co-founded the One Health Platform, a non-profit Foundation based in Belgium, which is responsible for the International One Health Congresses, of which the 6th will be held in Edinburgh in 2020.

He was elected to Fellow of the American Academy of Microbiology, and as a Fellow of the Australian Academy of Technological Sciences and Engineering. In 2002, he was appointed as Officer in the Order of Australia for services to public health research and to education and is the recipient of various awards including the Akademi Sains Malaysia's Mahathir Science Award for Excellence in Tropical Research.

Post nominals

AO, PhD, FTSE, FASM, FACTM

Brief Summary

I was a Professor of Tropical Infectious Diseases at Curtin University prior to my retirement.. Most of my recent work has been concerned with global aspects of infectious disease surveillance and response, particularly concerned with emerging zoonotic diseases, through working with the World Health Organization on various committees and consultancies. I have also been closely involved with establishing a new foundation to support the concept of One Health, the One Health Platform. I am also involved in other One Health activities, including organising the One Health congresses and co Editor-in-Chief of a new journal from Elsevier, called One Health. I am also asisting some of the public health programs at PathWest, and was appointed an Associate Fellow at Chatham House, London.

Overview

I have retired but continue my association with Curtin University as an Emeritus Professor. Most of my recent work has been concerned with global surveillance and response to outbreaks of emerging diseases, usually zoonoses, with a strong commitment and involvement in programmes within the World Health Organization (WHO), particularly through the Global Outbreak Alert and Response Network and the Asia Pacific Strategy for Emerging Diseases. I'm also very involved in all aspects concerned with the concept of 'One Health' – a recognition that the health of humans, animals and ecosystems are interconnected. In addition to these activities, I am closely involved in federal and state health activities concerned with emerging diseases, arboviral disease surveillance and biosecurity.

My research falls in three sections. The first between 1965 and 1983 was concerned largely with influenza, with emphasis on virus genetics, live virus vaccines, and the ecology of avian influenza in wild birds in Western Australia. During this phase, studies were also undertaken with foot-and-mouth disease virus, avian paramyxoviruses and murine cytomegalovirus. The second phase from 1983 to the present has been concerned with mosquito-borne viruses, including Ross River, Barmah Forest, Murray Valley encephalitis, West Nile and Japanese encephalitis viruses. The emphasis has been broad and has included surveillance, virus ecology, molecular biology and phylogenetics, diagnostic developments, and host resistance. The third phase has been in two parts – one concerned with emerging zoonotics bat-borne diseases including Hendra virus and Australian Bat lyssavirus, and the other concerned with global surveillance and response activities for infectious diseases.

Most recently my main interest has shifted to develop and support activities directed towards the One Health paradigm - the concept that recognises that the health of humans, animals, and their ecosystems are interconnected, and that to better understand and respond to newly emergent and/or zoonotic diseases, food safety and food security, ana antimicrobial resistance, requires coordinated, collaborative, multidisciplinary and cross-sectoral approaches. To this end, and in colaboration with a number of colleagues, we have initiated the Interational One Health Congresses, a new open access One Health journal in collaboration with Elsevier (https://www.journals.elsevier.com/one-health), and a new foundation, the One Health Platform (https://onehealthplatform.com/) to further international linkages and to support the aims and activities in the One Health space.

During my research career, my achievements are best exemplified by my publication record, with four books edited, a number of major textbook chapters, and over 330 peer-reviewed publications.

Memberships, Awards and Training

I am a member of various international committees including Foundation Member of the Asian-Pacific Society for Medical Virology; a member of the Advisory Board, Centre for Emerging Infectious Diseases, Chinese University of Hong Kong; an Associate of the Consortium of Conservation Medicine, New York; a member of the Scientific Advisory Committee, Centre for Emerging Infectious Diseases, Wuhan Institute of Virology, Chinese Academy of Sciences; a member of the Center for Infection and Immunity, Mailman School of Public Health, Columbia University; a member of the Advisory Board, EcoHealth Alliance, New York; a founding member and Vice-Chair of the One Health Platform a foundation to promote the One Health concept. I am also a member of various national and state committees including, National Arbovirus and Malaria Advisory Committee; the Australian National Certification Committee for the Eradication of Poliovirus; and most recently, the Biosecurity Council of Western Australia.

I have been a Consultant in Virus Diseases at the World Health Organization (WHO) since 1982 and a member of various committees within the WHO, including the Steering Committee of the Global Outbreak Alert and Response Network; a member of the Asia Pacific Technical Advisory Group on Emerging Infectious Diseases, Regional Offices of the Western Pacific, Manila, and of South-East Asia, New Delhi; a member of the International Health Regulations Roster of Experts; Chair of the International Health Regulations Emergency Committee on Influenza H1N1; and member and rapporteur, International Health Regulations Emergency Committee on Poliovirus. I was also Team Leader of the firstTechnical Mission to China to investigate the origin of SARS and a member of the WHO Tsunami relief team to Banda Aceh. I was also Convenor of the SARS International Research Advisory Committee and the SARS Laboratory Verification Network Committee at WHO in Geneva.

I have received a number of honours and awards during my career, including recipient of the D I Ivanovsky Medal, Russian Academy of Sciences; co-recipient of the The Medical Journal of Australia/Wyeth Research Award, for the best original research paper published in The Medical Journal of Australia during 1996; Distinguished Service Award, The Australian Society for Microbiology; Excellence in Virology Award, Asian-Pacific Society for Medical Virology; co-recipient of the James H Nakano Citation of the US National Center for Infectious Diseases of the Centers for Disease Control and Prevention, for an outstanding scientific paper published in 1999; appointed an Officer in the Order of Australia, Queen's Birthday Honours List, 2002, for service to microbiology research, particularly as a leading contributor in the understanding of the genetics, pathogenesis and public health implications of viruses, and to education; awarded the Premier's Research Fellowship, Science Council of Western Australia, Office of Premier and Cabinet; and Awarded the Mahathir Science Award of the Academy of Sciences Malaysia for Scientific Excellence in recognition of contributions and innovations towards solving problems in the tropics through science and technology.

My elected honours include election to President of the Australian Society for Microbiology (1992-94); as a member of the International Advisory Board, Virology Division, International Union of Microbiological Societies (IUMS) (1990-1996); to Fellowship of the American Academy of Microbiology (1997); to Member-at-Large of the Executive Board of IUMS, and subsequently to the position of Secretary-General 1996-2005); to President of the; Asian-Pacific Society for Medical Virology 2000-03); and to member of the Executive Board and subsequently to Vice-President of the International Committee for the Taxonomy of Viruses, of IUMS (2005-11). I was also appointed Chair of the National Committee for Microbiology, Australian Academy of Science for the period 1993-2000.

Employment History

- 1969-70: Post-doctoral Fellow, Public Health Research Institute of the City of New York
- 1970-72: Senior Scientific Officer and Head of Genetics Dept, Animal Virus Research Institute, Pirbright, UK
- 1973-79: Senior Lecturer, Dept of Microbiology, University of Western Australia
- 1980-94: Associate Professor, Dept of Microbiology, University of Western Australia
- 1985-86: Visiting Fellow, School of Biological Sciences, University of Warwick, UK
- 1981-85 and 1990-94: Head, Dept of Microbiology, University of Western Australia
- 1994: Professor, Dept of Microbiology, University of Western Australia

- 1994: Professor, Dept of Microbiology, University of Western Australia
- 1995-2004: Professor and Head of Dept of Microbiology, University of Queensland
- 2000-04: Professor of Tropical Infectious Diseases, University of Queensland
- 2001-04: Honorary Senior Principal Fellow, Queensland Institute of Medical Research
- 2003: Interim Chief Executive Officer, Australian Biosecurity Cooperative Research Centre for Emerging Infectious Diseases
- 2003-04: Temporary Medical Officer, Dept of Communicable Disease Surveillance and Control, World Health Organization, Geneva
- 2004-08: Non-Executive Director, Panbio Ltd (ASX:PBO)
- 2004-08: Premier's Research Fellow and Professor of Tropical Infectious Diseases, Curtin University.
- 2007-08: Deputy Chief Executive Officer, Australian Biosecurity CRC
- 2008-continuing: Honorary Professor, School of Chemistry and Molecular Biosciences, University of Queensland
- 2008 – continuing: Honorary Senior Principal Fellow, Burnet Institute, Melbourne
- 2009 - 2017: Research Associate, Curtin University
- 2016 - continuing: Vice-Chair, One Health Platform Foundation;
- 2017 - continuing: part-time (one session/week), Senior Medical Technologist-in-charge, PathWest, Perth
- 2018 -continuing: Emerritus Professor, Curtin University
- 2018-2021 - Member, WA Biosecurity Council

Specialty Areas

- Emerging viral diseases
- Arboviruses (mosquito-borne viruses)
- One Health

" In the wake of 10,000 dead mink at a mink farm in Utah, I feel compelled to make others aware of something I published with two fellow veterinarians about the need to fund/perform veterinary studies to establish species susceptibility; risk of transmission to humans; and investigation of potential animal reservoirs. Studies that should have been performed in February were not funded. We could easily have established species susceptibility by doing serosurveys of zoo species. We did that with West Nile virus and it provided a wealth of information. COVID-19? Nope. There has been a reluctance to investigate companion animals borne out of the fear of "what if we find something bad"? By this point, I now firmly believe that our national bird needs to change from the Bald Eagle to an ostrich. Burying our heads in the sand is not the way to address a novel zoonotic threat. I hope COVID-19 makes people recognize that taking a human-centric approach to novel zoonoses is short sighted and dangerous. "

West Nile Virus / 11/21/2011

Human and animal science converges in defeating zoonotic diseases

West Nile virus causes an emerging infectious disease that was first discovered in Uganda in 1937. In recent years it has spread beyond its traditional boundaries, causing illness in birds, horses, and humans in Europe and the United States. Since [the **West Nile Virus discovery in the United States (1999)**], West Nile virus has been detected in humans, animals, and mosquitoes throughout the United States.

In 1999 in New York City, several elderly people became deathly ill with signs of encephalitis, and crows began dying in large numbers in the same area. Analyses of human blood specimens by the Centers for Disease Control and Prevention (CDC) initially suggested St. Louis encephalitis (SLE), a disease that had previously occurred in the area and is transmitted from infected birds to humans by mosquitoes. But something didn't seem right since birds do not normally show any signs of illness from SLE. Dr. Tracey McNamara, head pathologist at the Bronx Zoo, began to investigate why a growing number of crows were becoming ill and dying. An epidemiologist at the city health department raised concern that the large numbers of dead birds might be connected to the human cases of encephalitis. McNamara soon was dealing with the deaths of a cormorant, several flamingos, and a bald eagle.

Analysis of samples from the dead zoo birds by the US Department of Agriculture National Veterinary Services Lab in Ames, Iowa, revealed a virus too small to be SLE virus. It was soon clear that the human and bird deaths were being caused by the same virus and that this was a newly emerging disease. Nearly 3 months after the initial outbreak, government scientists announced that the disease was caused by West Nile virus, which had never before been found in the Western hemisphere.

The 1999 epidemic in the New York City area resulted in 62 cases of encephalitis and 7 deaths. Zoo birds, American crows and at least 20 other North American wild bird species and horses were also affected. It is not clear how West Nile virus entered the United States. It could have come from a mosquito carried on a plane, or it may have been from an infected wild or imported bird. But since its introduction, West Nile virus has continued to spread and is now a significant threat to the health of humans, birds, and horses. Since 1999, there have been 1.5 million West Nile virus infections in the United States.

Dr. Mcnamara was "trained at the USDA's Plum Island Animal Disease Center"

Dr. McNamara was recognized for her work on the West Nile Virus outbreak in New York. In 1999, Dr. McNamara was the Head of Pathology at the Wildlife Conservation Society headquartered at the Bronx Zoo. She noticed an unusual number of dead crows on the zoo's premises, and she became alarmed when many of the birds in the zoo's collection died shortly thereafter. The deaths coincided with a mysterious viral disease afflicting some New York City residents.

Public health experts initially attributed the human illnesses to St. Louis encephalitis. But Dr. McNamara and her colleagues at the zoo did their own pathology tests on the dead birds at the zoo and identified West Nile virus as the real culprit.

Her efforts and those of other veterinarians during the outbreak highlighted the important role veterinarians play in ensuring public health.

Dr. Brandt recognized Dr. McNamara in particular for her tenacity. "Dr. McNamara has learned to never say never," he said. "Her skill, reasoning, and tenacity may have saved hundreds of lives."

Dr. McNamara is a diplomate of the American College of Veterinary Pathologists, and **was trained at the USDA's Plum Island Animal Disease Cente**r. She earned her DVM degree from Cornell University and received an honorary Doctor of Science degree from St. Lawrence University. [...]

NEW YORK Now family

AMUSEMENT

Who's Who at the Zoo

You can't tell the bipeds without a scorecard

By **KAREN AVENOSO**/Daily News Staff Writer

Bandit and Righty have a lot of folks to thank for making them stars among sea lions. An exhibit designer landscaped the rocks where they sunbathe. A nutritionist and a wild-animal keeper prepare the fish they eat twice a day. A veterinarian pays pool calls to perform physical exams.

At the Bronx zoo, where these sea lions reside, 683 staff people care for the 265-acre park and its 4,000 animals. What follows is a behind-the-scenes guide to our city's famous zoo — a look at the people who zip around the park in safari carts, caring for Bandit and his friends.

■ Ever wonder how an Ohio gorilla ended up with two girlfriends in New York City? Among other duties, the Bronx zoo's five **curators** are responsible for negotiating with other zoos to expand collections and to help prevent species from becoming extinct. Gorilla Timmy, it turns out, was lovelorn in Cleveland before the Bronx zoo, which already had two female lowland gorillas, volunteered to adopt him. Last year, Timmy's new sweetie, Pattycake, gave birth to baby Okpara.

The curators also coordinate the zoo's educational materials — from the painted placards on cages to media releases about the arrival of two proboscis monkeys from Germany. Each curator is assigned to birds, reptiles or mammals. As a team, they oversee all components of the collection.

■ Kim Tropea, one of the Bronx zoo's 100 **wild-animal keepers**, spends 45 hours a week with monkeys and sea lions. Her day begins with a morning feeding (fruit and insects for the monkeys, fish for the sea lions). While serving breakfast, she cleans cages, administers antibiotics and records changes in animals' behavior.

Recently transferred from the Mouse House, Tropea says she misses her former charges.

"I knew every single one by name. They really have unique personalities."

■ One zoo **veterinarian** does the work of a family practitioner, dentist and surgeon. The Bronx zoo's five clinical vets interact with curators and keepers on a daily basis, attending to sick animals in their cages or transporting them to the Wildlife Health Sciences Center for necessary X-rays, blood tests or surgery. Recent crises that have required their care: A naked mole-rat who needed a Caesarean section and a crocodile who came down with a case of zinc toxicosis (from swallowing a penny that a visitor had tossed into his pool).

■ Think of a Quincy who performs postmortems on gibbons and giraffes and you'll understand the animal **pathologist**. The Bronx zoo employs two of these professionals to study animals' causes of death. When one of the zoo's inhabitants dies, a pathologist immediately performs a necropsy, using slides of the animal's tissue. Though often the causes are natural, pathologists need to know about any parasites or viruses that could affect other animals.

■ Bandit the sea lion does not need to use the new food labels. A **nutritionist** watches what he eats. "A lot of animals would like to spend all their days eating Twinkies, but that's not in their best interests," explains one of the zoo's clinical vets, Dr. Tracey McNamara.

So, what's in a sea lion's best interest? Herring, mackerel and vitamin supplements to make up for any dietary deficiencies. The Bronx zoo's one full-time nutritionist does field research to determine creatures' diets. (Two years ago, she tracked black rhinos through Africa, plucking half-chewed leaves.) Based on her findings, the nutritionist works with keepers and employes at the animal commissary to develop viable menus.

■ Sue Chin has spent the last few months deep in the African jungle — without having to leave her desk. As one of the zoo's 12 **exhibit and graphic designers**, Chin is currently planning the Congo Forest exhibit where gorillas, okapi and mandrills will roam next year. For the new exhibit, she has worked with field researchers familiar with the African rainforest and with horticulturists who understand African vegetation.

Several years ago, she helped design a baboon preserve that resembles an African marketplace. The design team's creative coup: using chickens from the children's zoo to make scratchmarks in the market's pathways.

At the Bronx zoo, 683 staff people care for the 265-acre park and its 4,000 animals.

CARE & FEEDING: Wild-animal keeper Kim Tropea, left, dishes out herring to the sea lions, while technician Alfred Ngbokoli, above, studies slides in the zoo's pathology lab. GARY ROTHSTEIN

Detectives of animal world, zoo pathologists track clues

WASHINGTON (AP) – The white fuzz all over the pink-toe tarantula was a telltale clue.

A fungus, most likely. A sign of the infection that probably killed the hairy creature, Dr. Richard Montali said as he glanced over paperwork on the lifeless spider. Tissues will be collected and blood smeared onto slides – and both will be preserved if needed for future research.

As the chief pathologist for the Smithsonian's National Zoo, Montali confronts death routinely.

"Any given day we might have a fish or a bat and a spiny mouse and a lobster. Some invertebrate. We might have a snake," he said. "People think in terms of lions and tigers and rhinos and elephants, and that's very rare. ... They have pretty long lives."

Zoo pathologists play crucial roles in keeping the exotic animals on display healthy – often uncovering new diseases that threaten animals in zoos nationwide and even preventing extinction in the wild.

Think of them as veterinarian detectives, working in a lab nestled behind the menagerie of lions, tigers and bears that get all the regular visitors. Montali's workshop is an entirely separate animal kingdom, one with a hospital, various laboratories and numerous veterinarian colleagues.

The information gathered by pathologists comes not only from their own zoos but from veterinarians and researchers throughout the world.

"I can receive tissues from Mongolia because we have field researchers in 300 projects in 50 countries," said Tracey McNamara, chief pathologist at the Bronx Zoo in New York. "I work on tissues on penguins from Patagonia, from dolphins in Brazil."

Zoo animals need different attention than the average household pet, McNamara said, and vets still have much to learn about these animals, many of which are experts at masking diseases from their curators.

"They're not like a domestic dog," she said. "They're not going to go up and whimper to the keeper. Sometimes animals are simply found dead."

Like the slipper lobster found on its back in the aquarium.

An autopsy yielded a preliminary diagnosis. A curator had noted the lobster had not been eating. The creature's flat claws and lack of body fat suggested it died from malnutrition.

"Sometimes we can tell immediately, if there's some kind of obvious injury, or a twist of the intestines or something visible," Montali said, watching a vet resident examine a short-tail bat that apparently died after flying into something. "But often we don't."

Autopsies are performed in a building where the stench of formaldehyde and carcasses hangs in the air. Here, among the steel gurneys and subzero freezers, pathologists look for clues among the dead, collecting tissue samples and slides to examine under the microscope.

The information is then cataloged in a database that goes back several decades and is linked to zoos nationwide. Samples are often frozen for further investigation.

That's how Montali and an associate discovered a type of herpes virus that killed Kumari, the first elephant born at the National Zoo. Kumari died from a brief unknown illness in 1995, 16 months after she was born. Another apparent victim, 18-month old Astor, died in 1983 at the Bronx Zoo. Vets had no idea what killed these animals at the time, but tests of preserved tissue samples revealed the same herpes virus.

Montali's work also helped prevent golden lion tamarins from disappearing in Brazilian forests. Scientists had planned to propagate the South American monkeys in captivity and reintroduce them into the wild, but an unknown disease got in the way. About a dozen zoos reported similar outbreaks of the mysterious illness.

Montali worked with other veterinarians and physicians to pinpoint a cause, eventually identifying a virus similar to the one that causes hepatitis. In humans, the virus causes meningitis and affects the brain.

New York, Summer 1999 In late July 1999, Dr. Tracey S. McNamara, head of the veterinary pathology department at the Bronx Zoo, realized that crows

were dying in the neighborhood around the zoo grounds. Dr. McNamara's crow count had reached forty in August, about the same time that an infectious diseases specialist, Dr. Deborah S. Asnis, began caring for two elderly patients at the Flushing Hospital, across the East River in Queens.

The first patient, a sixty-year-old man, had been admitted to the hospital on August 12 complaining of three days of fever, weakness, and nausea. On admission, he had a temperature of 103°F and was thought to be suffering from pneumonia. However, on the fourth day he became confused and developed weakness in his limbs. His deep tendon reflexes, like the knee jerk, were feeble, his bladder stopped functioning, and his doctors had to insert a catheter to drain his urine.

Three days later, on August 15, an eighty-year-old man came to the same hospital with fever and weakness. He had collapsed at home and had been resuscitated in the field. On admission to the intensive care unit, he was already being supported by a mechanical ventilator, had a fever of of 104°F, and barely responded to the voices of his doctors. Then, on his third day in the hospital, sudden, total paralysis struck.

Laboratory tests suggested that the patients were suffering from viral encephalitis, and that the weakness was due to some kind of nerve damage, perhaps the Guillain-Barré syndrome. Unlike meningitis, which starts with inflammation limited to the membranes lining the outside of the brain, encephalitis affects the deep brain tissues immediately. Permanent neurological damage or death may result.

One of the most common causes of viral encephalitis is ***Herpes simplex***, the same virus that causes cold sores. But faced with cases of viral encephalitis during the summer, Dr. Asnis also had to consider infections contracted from the bite of a mosquito. The viruses that cause these arthropod-borne infections are called arboviruses, for short. Arboviruses in the United States include eastern equine encephalitis and St. Louis encephalitis. However, these two patients had a striking clinical feature in common that was not typical of any arbovirus with which Dr. Asnis was familiar. They had both been stricken with paralyzing weakness. Dr. Asnis wondered if she were dealing with an entirely new and very dangerous infection.

On Monday, August 23, she telephoned the New York City Health Department. She was put through to Dr. Marcelle Layton, the head of the department's Bureau of Communicable Diseases. Dr. Layton asked Dr. Asnis to submit samples of blood and of cerebrospinal fluid (the liquid that surrounds the brain, obtained by doing a spinal tap) to the New York State Health Department laboratory in Albany. Dr. Layton then dispatched an epidemiologist to Flushing Hospital to study the background of the two patients in order to determine whether they were linked by any common factors.

O**n Friday, August 27, Dr. Asnis called Dr. Layton to discuss a third possible case, and, while they were on the telephone, another doctor interrupted the call to tell Dr. Asnis about a fourth case. On Saturday, August 28, a fifth case was reported, this time from another hospital in North Queens.** Rather than a few sporadic cases, this was beginning to look like a true outbreak.

In addition to looking for clinical clues in the patients' histories, health department investigators sent samples of blood and cerebrospinal fluid from suspected encephalitis patients to the state laboratory for analysis. On August 31, the eighty-year-old man who had collapsed at home died in the intensive care unit at Flushing hospital. On September 2, one of the second group of patients Dr. Asnis had discussed with Dr. Layton also died. The victim, and eighty-seven-year-old woman, had been admitted to the hospital on August 20 with headache, loose stools, fever, and weakness. The health department obtained fresh brain samples from both of these fatalities and sent them t**o the state lab**.

The first apparent breakthrough in the encephalitis outbreak came from tests of blood and cerebrospinal fluid of this second fatality. **While no specific virus had been isolated on culture, the specimens from the eighty-seven-year-old woman did contain a type of antibody suggestive of infection by the St. Louis encephalitis virus, a mosquito-borne arbovirus in the yellow fever family.** Though it had never been reported in New York City, cases did occur during the summer months in rural and suburban areas in the southeast. Carried by birds and transmitted by mosquitoes, St. Louis encephalitis is known to cause very severe illness in patients over the age of fifty.

Based on these preliminary test results, Mayor Rudolph W. Giuliani called a news conference in Whitestone, Queens, on **September 4 and informed the public of the death of the eighty-seven-year-old woman from St. Louis encephalitis. He noted that it was likely, though not yet confirmed, that an eighty-year-old man who died at Flushing Hospital on August 31 had fallen to the same illness. While there is no specific treatment for St. Louis encephalitis, explained the mayor, the public needed to be informed and familiar with the symptoms of the illness.** Mayor Giuliani suggested that New Yorkers remain indoors in the evening and use insect repellent whenever they had to go outside. F**inally, the mayor reluctantly declared that the city would need to begin a limited program of nocturnal aerial spraying in northern Queens with the insecticide Malathion. This was a delicate issue; not only would he have to reassure people of the safety of the insecticide, but he would also have to convince everybody in the neighborhoods being sprayed to shut their windows tightly and keep air conditioners off all night despite the heat.**

While the public was trying to adjust to the first outbreak of St. Louis encephalitis, the crow epidemic spread over the fence and began killing birds inside the Bronx Zoo. By September 9, Dr. McNamara's zoo refrigerator contained a dead Guanay cormorant, five Chilean flamingos, a pheasant, and a bald eagle. Upon performing autopsies on the dead birds, she found that they had all died of encephalitis and severe inflammation of the heart. The forty-five-year-old pathologist felt certain that the bird and human encephalitis outbreaks were linked. However, she was not convinced that the infectious agent was St. Louis encephalitis, because birds infected with that virus typically don't die. On the other hand, she doubted that it was an equine agent, such as eastern equine encephalitis, and South America were affected. Like Dr. Asnis, Dr. McNamara suspected an unusual infectious agent, perhaps one that was newly evolved or recently introduced to this hemisphere. Undeterred by the official announcement, she decided to look further.

On September 9, Dr. McNamara called the Centers for Disease Control and Prevention in Atlanta (CDC) to alert them to a possible link between the avian outbreak and the human cases. She voiced her doubts about the diagnosis of St. Louis encephalitis and arranged to send them samples of bird tissue.

The next day Dr. McNamara also sent tissue samples from two flamingos to the United States Department of Agriculture National Veterinary Services Laboratory in Ames, Iowa. By Monday, September 13, cell cultures in Ames showed that the zoo birds and the wild crows appeared to be dying of the same virus. Although they could not tell exactly what it was, electron microscopy showed it to be the size of a flavivirus, the yellow fever group. Because the Ames laboratory lacked the necessary containment facilities to handle an uncharacterized virus that was potentially dangerous to human beings, they notified the CDC.

Meanwhile, Dr. McNamara's inquiries had led her to Dr. Daniel J. Gubler, head of the CDC's arbovirus field station in Fort Collins, Colorado. She sent more specimens and made frequent telephone calls to the Fort Collins laboratory. Later, when asked by the New York Times if it was "persistent sleuthing or persistent pestering" that solved the encephalitis mystery, she replied, "Let's say the secretaries recognize my voice."

On September 19, after a week without an answer from the CDC, Dr. McNamara decided to telephone the United States Army Medical Research Institute for Infectious Diseases (USAMRIID) in Maryland. USAMRIID took over the functions of the old biological warfare labs at Fort Detrick, and is now in charge

of national defense against biological agents. When she told the army about a possible new virus pathogenic for human beings as well as for birds, they expressed alarm for her safety and asked her to send samples to them immediately. By September 21, USAMRIID had confirmed the presence of a flavivirus in the bird samples and had notified the CDC.

While Dr. McNamara was pursuing a diagnosis of her avian cases, the scientists from the New York State Health Department were following a separate but ultimately converging trail of investigation. During the New York outbreak some of these scientists happened to be attending a conference in Albany, New York. In Albany, they had the brain samples from the fatal encephalitis cases to California and test them using advanced equipment for the study of rare viruses.

In mid-September, Dr. Lipkin began studying the brain samples in his Irvine lab using molecular probes to test the virus's genetic structure. By September 23, when the human toll had reached nine deaths, he had narrowed his search down to two flaviviruses, one native to Australia, called Kunjin, and West Nile virus. The next day both USAMRIID and his laboratories had completed their tests. The virus was West Nile.

West Nile virus was first isolated in 1937 from the blood of a feverish woman in the West Nile district of Uganda. It is in the yellow fever family, the flaviviruses (flavi means yellow in Latin)—a group of RNA viruses that also includes Japanese and St. Louis encephalitis, and Dengue fever. It is transmitted by the bite of the female mosquito to its bird host. Humans, horses, and domestic animals may also be infected, but are not important in perpetuating the virus in nature. Found throughout Africa and the Middle East and, less commonly, in Europe, Russia, India, and Indonesia, West Nile encephalitis caused an outbreak in Romania in 1996, in which there were approximately ninety thousand human cases with seventeen deaths. The strain of West Nile that the two labs isolated closely matched a virus found in a sick goose in Israel in 1998. Since West Nile is not generally lethal to its bird hosts, scientists speculate that the Israeli strain that found its way into the United States may have been particularly virulent. Alternatively, birds in the Western Hemisphere, being evolutionary strangers to the virus, may have been more sensitive to its effects.

In human beings, West Nile infection starts out like the flu, with fever and body aches. Patients may then develop some swollen glands, and about half will have a transient rash. Illness is usually mild, either because in areas where the disease is common, people, like birds, have become adapted to it over time, or because infection in these areas occurs in youth, when serious complications are unusual. In some parts of the Nile Delta in Egypt, for example, 40 percent of young adults show evidence on blood tests of past exposure to West Nile, and most do not recall a specific illness.

However, a fascinating experiment conducted in the early 1950s showed that West Nile could produce severe disease in some patients. Researchers working with cancer in laboratory animals had observed that certain viruses seemed to cause animal tumors to regress. In a desperate attempt to help patients with advanced malignancy, researchers injected them with massive doses of West Nile the inoculated patients came down with encephalitis, and one of the patients became paralyzed. Happily, they all recovered from their experimental infection.

We will probably never know how West Nile virus first arrived in the United States in 1999. That the epidemic started in the New York metropolitan area suggests that it was brought to this country by air or ship, rather than as a result of any natural bird migration. The three most likely sources were a recently infected airline passenger from the Near East, who still had the virus circulating in his bloodstream, an infected bird brought into the United States legally or illegally, or an infected mosquito brought by ship or airplane.

The New York patients were not suffering from a new disease then, but were the first cases of an old disease occurring in a new place. Based on past experience with West Nile, the investigators suspected that a wider outbreak of the disease was going on. Therefore, public health authorities asked all the hospitals in New York City and neighboring counties to report any suspected cases of viral infections of the central nervous system, including patients hospitalized back to August 1, 1999. They devised tests for West Nile antibodies in serum and cerebrospinal fluid. In that first year of the epidemic, the investigation identified fifty-nine patients hospitalized with West Nile infection in the New York metropolitan area, with seven fatalities. The median age of hospitalized patients was seventy-one years, but patients as young as five and as old as ninety were also affected. The risk of death was especially high in patients seventy-five years of age or older. In the first outbreak, thirty-two of the fifty-nine patients lived in the New York borough of Queens, and none of the cases occurred outside New York State. An ominous finding, however, was that infected birds were found in three nearby states—Connecticut, Maryland, and New Jersey.

Most North American birds proved more resistant to the virus than the crow; house sparrows and other migratory species can live with West Nile multiplying in their blood streams. Even as scientists were struggling to identify the virus during the fall of 1999, the bird migration season had already begun. West Nile was winging its way in a thousand birds to a thousand destinations.

The last recorded patient that first year fell ill on September 22, and the human epidemic ended when the weather turned cold and the mosquitoes stopped biting. But it was already clear that West Nile could not be contained by spraying affected neighborhoods, or even by spraying whole states. West Nile was sure to return with each summer's birds and mosquitoes. Scientists only hoped spread through the human population would be slow.

In preparation for the 2000 West Nile season, seventeen eastern states along the Atlantic and Gulf coasts, New York City, and the District of Columbia began West Nile surveillance. Beginning in the winter they collected mosquitoes, set up sentinel chicken flocks, sampled wild birds, and collected serum from horses and other mammals. In 2000, West Nile was found in twelve states, with human cases occurring in three. There were twenty-one cases of acute West Nile infection, with nineteen patients hospitalized, one death, and one patient left in a "vegetative state." Although the number of people identified with severe disease was less than in 1999, CDC estimated that approximately two thousand people had milder forms of the disease. Ominously, animal surveillance found over four thousand dead birds with West Nile, and, in addition, sixty-five horses were identified with severe neurological diseases. West Nile was detected in fourteen bats, four rodents, three rabbits, two cats, and two raccoons in New York, and in a skunk in Connecticut. During this outbreak, the CDC noted that severe disease in people in any given county was always preceded by fatal cases in birds, confirming the value of avian surveillance.

mals are simply found dead."

Like the slipper lobster found on its back in the aquarium.

In its case, an autopsy yielded a preliminary diagnosis. A curator had noted the lobster had not been eating. The creature's flat claws and lack of body fat further suggested it died from malnutrition.

"Sometimes we can tell immediately, if there's some kind of obvious injury, or a twist of the intestines or something visible," Montali said, watching a vet resident examine a short-tail bat that apparently died after flying into something. "But often we don't."

Autopsies are performed in a building where the stench of formaldehyde and carcasses clings in the air. Among the steel gurneys and subzero freezers, pathologists look for clues among the dead, collecting tissue samples and slides to examine under the microscope.

The information is cataloged in a database that goes back several decades and is linked to zoos nationwide. Samples are often frozen for further investigation.

That's how Montali and an associate discovered a type of herpes virus that killed Kumari, the first elephant born at the National Zoo. Kumari died from a brief and unknown illness in 1995, 16 months after she was born. Another apparent victim, 18-month old Astor, died in 1983 at the Bronx Zoo. Vets had no idea what killed these animals at the time but later tests of preserved tissue samples revealed the same herpes virus.

Montali's work also helped prevent golden lion tamarins from disappearing in Brazilian forests. Scientists had planned to propagate the South American monkeys in captivity and reintroduce them into the wild, but an unknown disease got in the way. About a dozen zoos reported outbreaks of the mysterious illness.

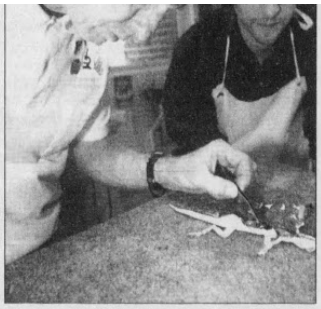
Montali worked with other veterinarians and physicians to pinpoint a cause, eventually identifying a virus similar to the one that causes hepatitis. In humans, the virus causes meningitis and affects the brain. In tamarins, it destroys the liver.

Once a disease is pinpointed, finding its cure or a treatment can be just as difficult. An antidote for one species doesn't necessarily work for another.

"Some of the vaccines available for domestic animals — say, canine distemper vaccine — are very effective in dogs," McNamara said. "But if you give that vaccine to red pandas, and they're very susceptible to [distemper], it actually induces disease."

Only a handful of accredited zoos have their own pathology departments, mainly because most zoos are nonprofit organizations that can't afford full-time pathologists.

"Those few of us working full-time in the field are understaffed and overworked," McNamara said.



Lizard: *Dr. Don Nichols, left, and National Zoo resident pathologist Jim Raymond perform an autopsy on a lizard.*

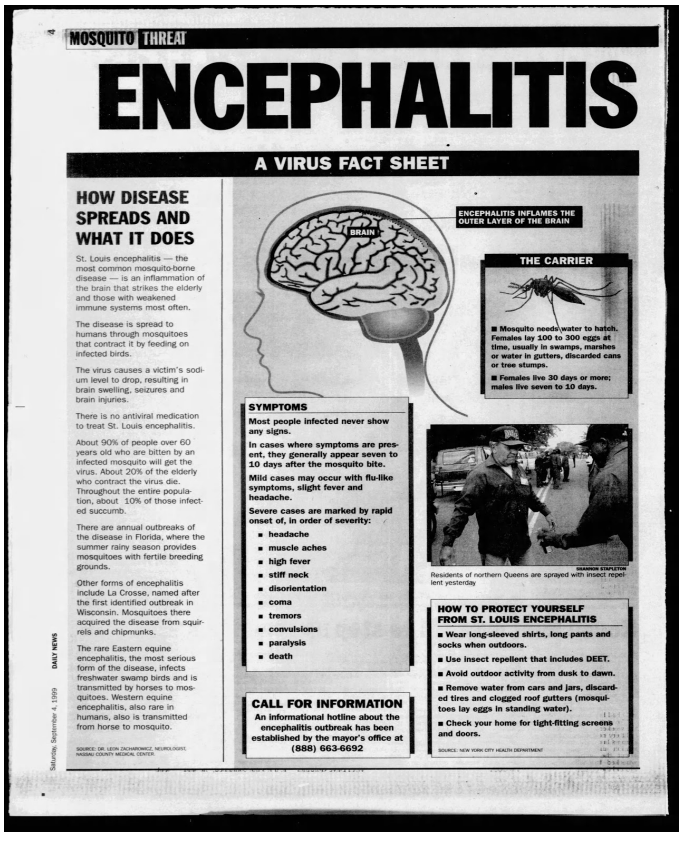
1999 (Sep 04)



MOSQUITO THREAT

ENCEPHALITIS

A VIRUS FACT SHEET

HOW DISEASE SPREADS AND WHAT IT DOES

St. Louis encephalitis — the most common mosquito-borne disease — is an inflammation of the brain that strikes the elderly and those with weakened immune systems most often.

The disease is spread to humans through mosquitoes that contract it by feeding on infected birds.

The virus causes a victim's sodium level to drop, resulting in brain swelling, seizures and brain injuries.

There is no antiviral medication to treat St. Louis encephalitis.

About 90% of people over 60 years old who are bitten by an infected mosquito will get the virus. About 20% of the elderly who contract the virus die. Throughout the entire population, about 10% of those infected succumb.

There are annual outbreaks of the disease in Florida, where the summer rainy season provides mosquitoes with fertile breeding grounds.

Other forms of encephalitis include La Crosse, named after the first identified outbreak in Wisconsin. Mosquitoes there acquired the disease from squirrels and chipmunks.

The rare Eastern equine encephalitis, the most serious form of the disease, infects freshwater swamp birds and is transmitted by horses to mosquitoes. Western equine encephalitis, also rare in humans, also is transmitted from horse to mosquito.

THE CARRIER

- Mosquito needs water to hatch. Females lay 100 to 300 eggs at time, usually in swamps, marshes or water in gutters, discarded cans or tree stumps.
- Females live 30 days or more; males live seven to 10 days.

SYMPTOMS

Most people infected never show any signs.

In cases where symptoms are present, they generally appear seven to 10 days after the mosquito bite.

Mild cases may occur with flu-like symptoms, slight fever and headache.

Severe cases are marked by rapid onset of, in order of severity:

- headache
- muscle aches
- high fever
- stiff neck
- disorientation
- coma
- tremors
- convulsions
- paralysis
- death

SHANNON STAPLETON

Residents of northern Queens are sprayed with insect repellent yesterday

HOW TO PROTECT YOURSELF FROM ST. LOUIS ENCEPHALITIS

- Wear long-sleeved shirts, long pants and socks when outdoors.
- Use insect repellent that includes DEET.
- Avoid outdoor activity from dusk to dawn.
- Remove water from cars and jars, discarded tires and clogged roof gutters (mosquitoes lay eggs in standing water).
- Check your home for tight-fitting screens and doors.

Viral peril worries nabe

By MICHAEL R. BLOOD, MARTY ROSEN and LISA L. COLANGELO
DAILY NEWS STAFF WRITERS

An outbreak of St. Louis encephalitis has killed an 80-year-old man in northern Queens and may have sickened as many as two dozen other people, health officials said yesterday.

Authorities confirmed three cases of the disease, which is transmitted by mosquitoes, and were investigating whether the virus had killed a second Queens resident, an 87-year-old woman.

The city started spraying the Whitestone, Flushing and Auburndale areas with the pesticide pyrethreum by helicopter last night. Spraying was expected to continue today.

Officials at the federal Centers for Disease Control and Prevention in Atlanta said most people recover from the St. Louis strain, but added that it can kill 5% to 10% of those it strikes, with the death rate as high as 30% in elderly victims.

Duane Gubler, director of the CDC's division of vector-borne infectious diseases, said the outbreak was probably not a major health risk, but he expressed surprise and worry that the disease had struck such an urban area as Queens.

"It's something to be very concerned about," he said. "But I don't think it is something you need to be concerned about for the whole city."

There is no vaccine to protect against St. Louis, which is striking here for the first time, according to Sandra Mullin of the city Health Department.

"It is the first-ever confirmed cases of this in New York City," Mullin said. "That certainly makes it a remarkable event. The fact is, while some people who are bitten by an infected mosquito can contract St. Louis encephalitis, there are very few mosquitoes that tend to be infected."

The last major nationwide epidemic of mosquito-borne encephalitis occurred in Illinois in 1975, when 581 cases of St. Louis encephalitis left 47 people dead.

"If you're bitten, and you're over 60, your chances of dying are pretty high," said Dr. Leon Zacharowicz, a neurologist at Nassau County Medical Center.

He said the outbreak, which is most dangerous for the young and the elderly, is cause for concern.

"It can cause a major epidemic if it's not contained," he said.

By LISA L. COLANGELO
DAILY NEWS STAFF WRITER

Kathy Reiter runs the air conditioner day and night to fend off mosquitoes that blow across her Queens neighborhood from Long Island Sound.

The longtime resident of the Malba section discovered yesterday that this year's crop of bugs is more than a nuisance. Some of the mosquitoes carry a form of potentially deadly encephalitis.

"It's just scary," said Reiter's daughter, Jaye Anne. "There are all these schools around here. What about the kids?"

Up and down the quiet tree-lined blocks, residents worried over reports of the outbreak of the fatal ailment, spraying overhead and police going door-to-door with pamphlets.

"I'm upset, because I really don't know anything about this," said Giovanna Battaglia. "I'm scared of it, and no one has told us what to do."

Battaglia has two daughters, 5-month-old Christina and 2-year-old Sabrina.

Warnings to keep them indoors and wearing long sleeves only had her more worried.

"I'm getting out of town for the weekend," she said.

Jittery neighbors gathered on corners last night, trading information and swapping rumors about the outbreak as boys whacked baseballs in a park around the corner.

Health officials said they hope to have the problem contained by next week and don't expect any special problems for children. People bitten by mosquitoes carrying the virus usually do not develop St. Louis encephalitis, health officials said.

Residents say mosquitoes always have infested this area, which looks out on the swamps Powell's Cove beneath the Bronx-Whitestone Bridge.

Reiter never goes swimming in the pool after a long day of work. Vicki Lanzellotto ducks indoors every summer evening at 7 o'clock.

"We've always had a problem with mosquitoes, but no one has ever been sick as far as I know," said Joanne McCauley, 52. "I am worried, just because I don't know anything about it."

Lanzellotto, who has lived in the area for 18 years, said officials once placed canisters of repellent in the sewers to ease the mosquito problem.

But no one ever worried the skeeters could put their lives in danger — until now.

"I just want to know how to protect my family," Lanzellotto said.

With Dave Goldiner

The city Health Department immediately sent a medical alert to all New York City hospitals, seeking assistance in identifying and reporting any possible cases of the virus.

Gubler estimated the outbreak began about Aug. 9, sparked by mosquitoes feeding on infected birds.

"That's what caused the cycle to get started," he said.

Gubler said the CDC received four samples from the New York State Health Department on Thursday, confirmed the existence of St. Louis encephalitis yesterday morning and immediately notified state and city officials.

Mayor Giuliani called for calm, and Queens Borough President Claire Shulman insisted, "This is not a moment for panic."

The mayor also implored area residents not to panic, but to stay inside their homes from dusk until dawn while the spraying is taking place.

"We will do everything we can to wipe out the mosquito population," he said at a hastily called news conference at the corner of 138th St. and 11th Ave.

Giuliani advised that anyone venturing out should wear long pants and long sleeves, and apply plenty of insect repellent containing DEET.

At Shea Stadium last night, an announcement was made on the scoreboard and over the loudspeaker that fans concerned about the disease could obtain bug repellent from ushers. The National Tennis Center next door, where the U.S. Open is in full swing, made no such offer and had no comment about the outbreak.

In all, health officials are investigating 24 cases. Only three cases have been confirmed: a 58-year-old man, a 60-year-old man and the 80-year-old man, a resident of Whitestone who died earlier this week.

Mullin said there was no evidence "right now that it is widespread. We don't expect this is going to happen citywide."

City officials think the disease was brought into Queens by a migrating bird.

Most of the victims live within a 4-mile radius, although one suspected case was detected in a South Bronx resident. Another victim lives in lower Manhattan but works in the Whitestone area.

Health officials said they planned to go door to door in the neighborhood, passing out information and cans of repellent.

Encephalitis, E. coli outbreaks challenge state health officials

■ Investigators are seeking the sources of two deadly illnesses.

The Associated Press

ALBANY — Facing two major outbreaks, state Health Department workers have become detectives to root out the source of the deadly illnesses in New York City and upstate.

"They have to do a lot of what they call shoe leather epidemiology," said Donald Dixon Despommier, a microbiology professor at Columbia University's School of Public Health. The work requires seemingly unending walking and field interviews.

In New York City, at least nine cases of mosquito-borne encephalitis have been confirmed with another 89 under investigation. It has killed two people in Queens and one in Brooklyn, all senior citizens. The disease has never been recorded in the city before.

Officials ordered pesticide spraying from helicopters and on the ground. "The more dead mosquitoes, the better," Mayor Rudolph Giuliani said.

Upstate, 732 people have been sickened and one child and one adult have died after the largest E. coli outbreak in state history — and one of the worst nationally. Health officials said that reports of illness are still coming in and up to 1,000 people may be infected.

That outbreak was likely caused by the contamination of drinking water with cow manure at the Washington County Fair, about 35 miles north of Albany.

Investigators have yet to find the original carrier for either sickness, which would help determine how it happened and what could be done to prevent it from recurring.

State health officials are doing the best job they can under the circumstances, said Dr. David Swerdlow, a medical epidemiologist at the Centers for Disease Control in Atlanta, Ga.

"Unfortunately, sometimes these things do take a little bit of time," Swerdlow said. "The New York state Health Department is a very good

> "Unfortunately, sometimes these things do take a little bit of time. The New York state Health Department is a very good health department and they are certainly capable of investigating an outbreak of E. coli 0157:H7."
>
> Dr. David Swerdlow, Centers for Disease Control

early as Aug. 26, but the first samples they were able to take were from Sept. 3, meaning they're not testing the same water that people sickened by the bacteria drank.

Just about everything went wrong at the fair to contribute to the apparent contamination.

A freak thunderstorm roared on Aug. 26, which possibly drummed the cow manure into the ground.

The yearlong drought should have made the ground hard enough to keep water from soaking into the 20-foot-deep suspect well. But the ground had just been dug up and softened for the installation of two nearby wells and was ready to soak up E. coli-infected water.

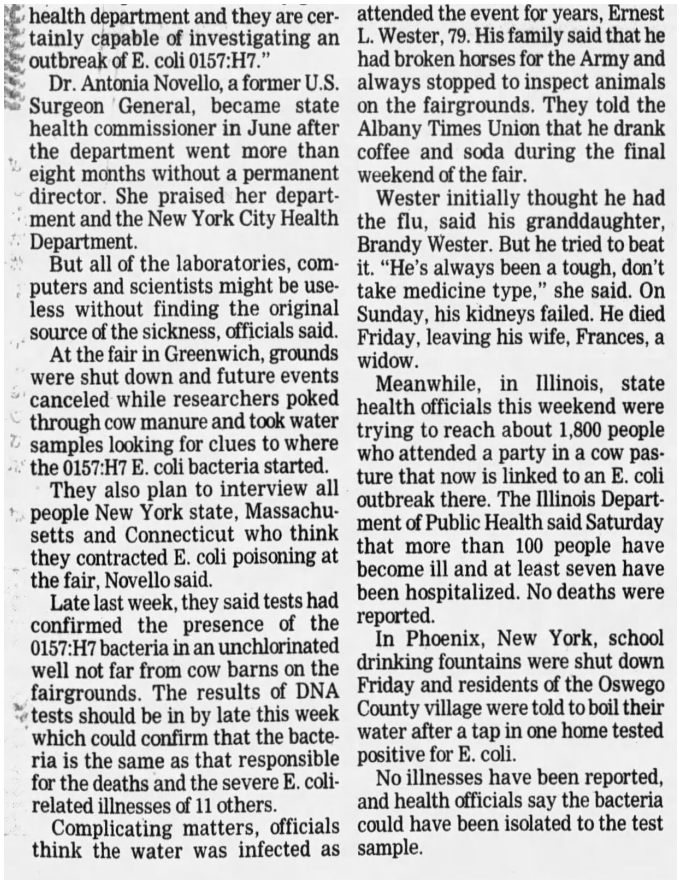
The well which health officials think the deadly strain came from wasn't even supposed to be used. But this summer's drought forced it into service, Novello said. The weekend was unusually hot and muggy, drawing people to iced drinks and frozen treats.

"It's like an act of God," Novello said.

Complicating matters, health officials said late last week that they confirmed more than two dozen cases of campylobaceteriosis among Washington County Fairgoers. Its symptoms and means of transmission mirror those of E. coli.

The first victim of the fair's water was 3-year-old Rachel Aldrich. Her parents buried her Friday.

The second casualty was a World War II veteran who faithfully



health department and they are certainly capable of investigating an outbreak of E. coli 0157:H7."

Dr. Antonia Novello, a former U.S. Surgeon General, became state health commissioner in June after the department went more than eight months without a permanent director. She praised her department and the New York City Health Department.

But all of the laboratories, computers and scientists might be useless without finding the original source of the sickness, officials said.

At the fair in Greenwich, grounds were shut down and future events canceled while researchers poked through cow manure and took water samples looking for clues to where the 0157:H7 E. coli bacteria started.

They also plan to interview all people New York state, Massachusetts and Connecticut who think they contracted E. coli poisoning at the fair, Novello said.

Late last week, they said tests had confirmed the presence of the 0157:H7 bacteria in an unchlorinated well not far from cow barns on the fairgrounds. The results of DNA tests should be in by late this week which could confirm that the bacteria is the same as that responsible for the deaths and the severe E. coli-related illnesses of 11 others.

Complicating matters, officials think the water was infected as

attended the event for years, Ernest L. Wester, 79. His family said that he had broken horses for the Army and always stopped to inspect animals on the fairgrounds. They told the Albany Times Union that he drank coffee and soda during the final weekend of the fair.

Wester initially thought he had the flu, said his granddaughter, Brandy Wester. But he tried to beat it. "He's always been a tough, don't take medicine type," she said. On Sunday, his kidneys failed. He died Friday, leaving his wife, Frances, a widow.

Meanwhile, in Illinois, state health officials this weekend were trying to reach about 1,800 people who attended a party in a cow pasture that now is linked to an E. coli outbreak there. The Illinois Department of Public Health said Saturday that more than 100 people have become ill and at least seven have been hospitalized. No deaths were reported.

In Phoenix, New York, school drinking fountains were shut down Friday and residents of the Oswego County village were told to boil their water after a tap in one home tested positive for E. coli.

No illnesses have been reported, and health officials say the bacteria could have been isolated to the test sample.

1999 (Sep 25) - NYTimes : "African Virus May Be Culprit In Mosquito-Borne Illnesses"

By Jennifer Steinhauer / Sept. 25, 1999 / [HN01I8][GDrive]

The mosquito-borne illness that has killed three people in New York City may not be St. Louis encephalitis, as experts have thought, but rather a similar disease that has never been diagnosed in the Western Hemisphere, Government scientists said yesterday.

The disease, West Nile virus, was discovered this week in dozens of birds that died in and around the Bronx Zoo this summer. The virus is indigenous to Asia and northern and eastern Africa and occasionally makes its way to Europe, but has never been found in birds or people in this hemisphere, said **[Dr. Duane J. Gubler (born 1939)]**, the director of the division of vector-borne infectious disease at the Federal Centers for Disease Control and Prevention.

Before yesterday, the illness that has infected at least 14 people in New York City and 4 in Westchester County was believed to be St. Louis encephalitis, which was surprising enough because that disease is rarely found outside the Southeastern United States.

Scores of tests will need to be completed before health officials will be able to say for sure whether the infections were caused by some type of West Nile virus or St. Louis encephalitis. Officials at the C.D.C. said they hope to have the tests completed sometime next week.

But the discovery of the West Nile strain in the birds has cast some doubt on the original diagnosis, officials said. "West Nile virus is closely related to St. Louis encephalitis, the virus we thought was causing the outbreak," **[Dr. Duane J. Gubler (born 1939)]** said. The discovery of the dead birds, he said, "has caused some confusion as to whether that is true now."

The finding of the West Nile virus in New York stunned experts, who have no theory so far on how the strain found its way here.

If officials confirm that the disease that sickened New Yorkers was the West Nile virus, it would have no practical effect on those who have fallen sick, or on the efforts to control the disease from spreading. Both illnesses are transmitted from birds to mosquitoes to people by the same type of mosquitoes, and the same insecticide would be used.

The symptoms of both illnesses are virtually the same and are usually mild, though in rare cases they can cause neurological disorders and even death.

Experts said those severe cases -- which generally involve the elderly, children under 5 and those with compromised immune systems -- are even less frequent with West Nile virus.

"The important message to get across is that all the public health and responsive measures implemented are the same," said Tom Skinner, a spokesman at the C.D.C.

But from an epidemiological standpoint, the discovery of West Nile virus in New York is remarkable. "This is exciting," Dr. Gubler said. "We prefer it didn't occur, but it is interesting."

"What we are seeing in the waning years of the late 20th century is the transport and movement of these viruses in new areas," he added. "And you get a virus moving into a new area, the entire mosquito population is susceptible."

Yesterday, two elderly women were added to the list of confirmed cases of the mosquito-borne illness. One of the women, who is 90 years old and in critical condition, was the first case to be confirmed in Manhattan since the outbreak began in August. Officials said the woman, who lived near Central Park, apparently contracted the virus in Manhattan, but it was not clear where.

Now, old and new blood samples from people with symptoms, trapped mosquitoes, as well as roughly 450 birds will be examined to see whether the West Nile virus found in the birds was what has caused the New Yorkers to become ill.

It is not surprising that the diagnosis of those who have taken ill could have been mistaken, experts said -- the illnesses appear very similar, and few would have thought to look for an illness whose closest brush with this country was in France in the 1960's. The worst modern outbreak of the West Nile virus was in Romania in 1996, when 90,000 cases were confirmed and 17 people died.

The discovery of the West Nile virus came about in large part by some dogged sleuthing by a head of the department of pathology at the Bronx Zoo, Federal officials said. That pathologist, **Tracey McNamara, said she became concerned in late July when she heard that a large number of crows had been dying around the zoo. Then, birds at the zoo began to go. Over Labor Day weekend, the zoo lost a Guanay Cormorant, three Chilean flamingos, a pheasant and a bald eagle. Because these deaths followed those of some crows, experts strongly doubt that the disease originated in the zoo.**

Autopsies of the birds revealed streaking in the heart and brain hemorrhages. An equine encephalitis was suspected, but Dr. McNamara was skeptical, because the emus in her care, which are very susceptible to that illness, were thriving.

When two more flamingos died on Sept. 9, she sent samples to laboratories of the United States Department of Agriculture, which ruled out all the common bird viruses. Stymied, they called in an equine virologist to do further testing. The C.D.C. and doctors at an Army lab in Maryland were also sent samples.

Yesterday, the C.D.C. discovered the West Nile virus link."Everyone was shocked," Dr. McNamara said. "It's possible it came in with a human being or a smuggled bird, and I am not at all certain it will ever be established how it got here."

The Mayor's Office of Emergency Management, which has been in charge of the spraying, would not comment on the C.D.C. news.

As Westchester County prepared to continue its spraying last night, many Jewish residents voiced concern that such efforts would interfere with the start of the Succoth holiday, which requires observants to sit in an open air tent or hut to take their evening meal.

Victoria Hochman, a spokeswoman for the Westchester County Executive's office, said the agency was aware of the holiday and had contacted regional Jewish centers, "but we have decided it is a health emergency and we have to go with the spraying for the good of everyone."

Connecticut officials said they would not spray any more until receiving results from recent mosquito testing, and New York City completed its second round on Thursday night and would also wait to see when and if it would need to spray again.

1999 (Sep 26) - NYTimes : "Exotic Virus Is Identified In 3 Deaths"

By Andrew Jacobs / Sept. 26, 1999 / [HN01I9][GDrive]

The mosquito-borne illness that has killed three people in New York City is not St. Louis encephalitis, but a similar disease that has never before been found in the Western Hemisphere, health officials said early this morning.

Scientists in two states who have been examining brain tissue from the people killed by the outbreak of encephalitis confirmed that it was caused either by West Nile virus, from Africa, or Kunjin virus, a variant that is found only in Australia.

Since last month, 14 people in New York City and Westchester County have been diagnosed with encephalitis, although it was unclear whether the two strains identified today are responsible for all the cases.

An official with the Centers for Disease Control and Prevention in Atlanta, and a researcher at the University of California at Irvine said this morning that the closely related strains had been positively identified in the brain matter of New York City residents killed by encephalitis. Until now, neither strain had been found in birds or people in this hemisphere.

[**Dr. Duane J. Gubler (born 1939)**], director of the C.D.C.'s division of vector-borne infectious diseases, said that the agency's lab found the West Nile virus in the brain of one of the victims early last week. "It was a total surprise to us," he said. "There was no reason to suspect that we'd find West Nile here."

[**Dr. Walter Ian Lipkin (born 1952)**], the director of the Emerging Diseases Laboratory at the University of California at Irvine, said his colleagues had identified the virus in the brains of three victims from Queens that had been sent to his lab last week. "It's very odd that they've been found here," he said. "On the other hand, viruses evolve and they have the capacity to adapt themselves." Dr. Lipkin emphasized that the genetic difference between West Nile virus and Kunjin virus is so slight that the two are practically the same strain.

Until yesterday, New York health officials said they had found the West Nile virus only in birds that had died in and around the Bronx Zoo. But this morning, after the C.D.C confirmed the discovery of the virus in humans, a state official acknowledged that officials had known about the findings of [**Dr. Walter Ian Lipkin (born 1952)**] and Dr. Gubler for several days, but wanted to conduct more tests.

John Signor, a State Health Department spokesman, said the ageny was planning to release the information tomorrow after more testing confirmed the earlier findings. "The identification of a virus is a complex process," he said. "We felt more testing needed to be done."

Despite the discovery that the encephalitis outbreak had been caused by a different virus, officials said that the public health measures undertaken to date would not change: the spraying of mosquitos and warnings to reduce exposure to the insects remains. Mr. Signor said that the treatment for those already infected with the disease would remain the same.

The Federal Centers for Disease Control and Prevention said Friday night that its scientists had identified a West Nile-like virus in four birds from New York that they had tested in their laboratory in Fort Collins, Colo.

The birds included two flamingos and an Asian pheasant from the Bronx Zoo, and a crow reported to be from Scarsdale, said Kristine Smith, a spokeswoman for the New York State Health Department.

Yesterday, city health officials continued collecting dead birds, which they had started to do on Friday. Special telephone lines and asked residents to call in sightings of dead birds. By 4 P.M. yesterday, the City Health Department had received two dozen reports of dead birds in all five boroughs, and sent out staff members from its pest control division to retrieve specimens, said a spokeswoman, Sandra Mullen.

"The birds will be kept on dry ice and brought to our Bureau of Laboratories," she said, adding that most of the dead birds reported were crows, which have been dying in large numbers since the beginning of the outbreak. Health officials in Suffolk County collected five dead crows on Friday, and sent them for analysis to the State Department of Environmental Conservation yesterday, said the director of public health, Mahfouz Zaki.

And after receiving reports at 5:30 P.M. on Friday that earlier samples from dead crows tested positive for an encephalitis-like disease, they sprayed South Huntington and Huntington Station with pesticides.

In Manhattan, a team from the Parks Department swept through Central Park on Friday night searching for dead birds but found none, said Parks Commissioner Henry J. Stern. He said that more teams would be dispatched, but that all park staff members had been notified and were on the lookout.

News that the infection was either West Nile virus or an Australian variant has deepened an epidemiological mystery that began in July with the deaths of numerous crows around the Bronx Zoo.

A pathologist at the zoo, Tracey McNamara, first noticed that large numbers of crows were dying, reaching 40 by August. Then, birds at the zoo, including a guanay cormorant, three Chilean flamingos, a pheasant and a bald eagle, died.

Though the symptoms of both diseases are similar, and the steps to combat them are the same, the mosquitoes that carry them can differ, health officials said.

Ms. Smith of the State Health Department said the mosquitoes that carry St. Louis encephalitis and West Nile viruses, the Culex pipiens, are generally active from dusk to dawn. But another type of mosquito known to carry the West Nile virus, the Aedes vexans, is also active during the day, she said.

The symptoms of both illnesses are usually mild, but in some cases can cause neurological disorders and even death.

1999 (Sep 28) : NYTimes : "THE DOCTOR'S WORLD : THE DOCTOR'S WORLD; Encephalitis Outbreak Teaches an Old Lesson"

By Lawrence K. Altman, M.d. / Sept. 28, 1999 / [HN01IA][GDrive]

When you hear hoofbeats, don't think of zebras.

To doctors, the axiom is a call to focus on common ailments and not waste time on the exotic. But on those rare occasions when they do detect a zebra, doctors say they need to take extra steps in their investigation to make sure they have identified the right one.

A case in point is the encephalitis outbreak that is blamed for at least three deaths in New York City. Earlier this month, the Centers for Disease Control and Prevention in Atlanta and the New York City Health Department said the cause was the mosquito-borne St. Louis virus, which had never been identified in New York City before.

But last weekend the C.D.C., responding to findings from laboratory tests performed by Dr. Tracey McNamara, a pathologist at the Bronx Zoo, announced that the outbreak was caused by an even rarer zebra: the West Nile virus from Africa. [Dr. Walter Ian Lipkin (born 1952)], of the Emerging Diseases Laboratory at the University of California at Irvine, confirmed the findings.

The viruses are closely related, causing virtually the same type of inflammation of the brain. But the West Nile virus had never before been detected in the Western Hemisphere.

'C.D.C. would not have made the diagnosis of West Nile virus as quickly without Dr. McNamara's persistent medical sleuthing," [Dr. Duane J. Gubler (born 1939)], the head of the C.D.C.'s arbovirus field station in Fort Collins, Colo., said in an interview.

The change in diagnosis, though not important in terms of the spraying and other public health measures taken to combat the outbreak, was scientifically embarrassing to the C.D.C., the premier Federal agency that is responsible for tracking infectious diseases in this country.

In recent years, C.D.C. and other health officials have led a campaign against the threat of new and emerging infections, warning doctors to expect more infectious disease "zebras," like the sudden appearance of old microbes in new areas.

In fact, health officials thought they had scored a coup when they diagnosed the mysterious illness as the St. Louis virus. The disease is usually found in the Southeastern states, and humans are usually bystanders in such infections. Birds are the principal reservoir for the arboviruses, but they do not become sick. Instead, mosquitoes transmit the viruses to people, who may become ill.

In hindsight, the concurrent deaths of an unusual number of birds in the city has turned out to be an important but underestimated clue. Federal and local medical sleuths did not immediately relate the bird die-off to the human outbreak because West Nile, St. Louis and similar encephalitis viruses generally do not kill birds.

Now the C.D.C. is retesting blood and spinal fluid from patients who had symptoms of encephalitis and who did not show evidence of the St. Louis virus.

The new findings mean that health workers need to investigate a number of other possibilities, [Dr. Duane J. Gubler (born 1939)] said.

A critical one is that the C.D.C. can no longer be certain that the West Nile virus has never been present in the United States, because the Federal scientists never specifically checked for it in earlier outbreaks and individual cases. In testing mosquitoes and specimens from humans with encephalitis, the C.D.C. routinely checks all types of viral encephalitis known to have caused infection in the Western Hemisphere, Dr. Gubler said.

There can be considerable overlap in findings from the laboratory tests unless extra steps are taken to distinguish between the many types of encephalitis-causing arboviruses. In a sense they are all one virus, but with many variations that can be detected in the laboratory. The encephalitis they cause is the same disease, although there can be subtle differences in the type of brain damage they produce.

The viruses occur in different geographic areas, and by scientific custom they are named for the area where they were discovered. They include Murray Valley encephalitis in Australia, Japanese encephalitis, and Rocio virus in Brazil and Argentina. They are distinguished in the laboratory by small differences in the proteins in the covering of the virus known as its envelope.

"We don't include West Nile, Japanese and other encephalitis viruses because they have never been known to be here," Dr. Gubler said, adding that in the New York outbreak, "we had tunnel vision on St. Louis virus, because all the clinical, epidemiological, laboratory and geographic features pointed to St. Louis."

"We've learned a lesson here," Dr. Gubler continued. "We've got to be more open-minded.

"Once we get past this crisis, we are going to have to go back and check specimens from C.D.C. and state health departments to see if it has been here, and if so for how long."

The West Nile virus was discovered in 1937 in Uganda. Since then "it has rarely reared its head," [Dr. Duane J. Gubler (born 1939)] said, though outbreaks and occasional cases have been reported from Israel, France, Romania and elsewhere in Europe. Presumably the virus was carried northward by birds migrating from Africa.

After a nearly two-decade silence, West Nile virus caused a large outbreak in Romania in 1996. This year, West Nile virus apparently caused illness among humans in Volgograd, Russia, though Dr. Gubler said he had received no reply to an inquiry he has made to Russian scientists about the outbreak. Lack of communication among scientists thwarts efforts to learn why a virus is spreading.

When birds began dying in and near the Bronx Zoo, Dr. McNamara, the pathologist there, initially thought the deaths might be a result of viruses that cause avian influenza, Newcastle disease, fowl cholera or Eastern equine encephalitis, Dr. Gubler said.

Dr. McNamara sent the specimens to the Department of Agriculture Laboratory at Ames, Iowa, where scientists eliminated those candidates. Because the Ames laboratory lacked the material to test for the pertinent arboviruses, they forwarded the specimens to the C.D.C., Dr. Gubler said.

Dr. Gubler said scientists also needed to investigate whether the deaths of the birds indicated that West Nile virus had become more virulent.

Also, the virus has been shown to stay in the blood of humans longer than other types of encephalitis virus, so that mosquitoes are more likely to pick it up and transmit it to other humans. But whether such transmissions occur on a regular basis is not known, Dr. Gubler said.

A main focus will be to prevent a recurrence of the outbreak in New York next summer. Scientists do not know whether the virus can persist in infected mosquitoes while they hibernate over the winter, Dr. Gubler said. In the absence of definitive information, health officials will consider the need to begin control of storm drains to decrease the probability of infected mosquitoes' surviving over the winter.

1999 (Oct 11) - NYTimes : "In New York Outbreak, Glimpse Of Gaps in Biological Defenses"

By Jennifer Steinhauer and Judith Miller / Oct. 11, 1999 / [HN01IB][GDrive]

On Sept. 23, nearly three weeks after **Mayor Rudolph W. Giuliani** announced that New York was being attacked by a mosquito-borne virus often found in the Southern United States, senior Federal health officials convened a conference call to hear some startling news.

The scientist who initially identified the virus as St. Louis encephalitis said he had changed his mind, an official who was present said. It was probably a form of West Nile virus, a disease never before seen in the Western hemisphere.

Stunned by the sudden turn, senior officials at the Federal Centers for Disease Control and Prevention peppered their colleague with questions. Was he sure? What testing was done? Was it repeated?

The officials decided not to inform New York of the new finding immediately. They sent the scientist, **[Dr. Duane J. Gubler (born 1939)],** back to his laboratory in Fort Collins, Colo., to do more tests. He reconfirmed the conclusion, and the next morning, calls went out to New York City.

Federal public health officials were chagrined but not overly worried by the sudden switch in diagnosis. West Nile virus is slightly less virulent than St. Louis encephalitis, and the city was already eradicating the mosquitoes that transmitted the disease, whatever it was.

But the announcement caused concern among many of the scientists and Government officials who are working to strengthen the nation's defenses against biological warfare. They saw the New York outbreak as a dress rehearsal, a test of how public health officials could detect and deal with the sudden spread of a disease not typically found in the United States. To them, the missed diagnosis was unnerving.

''The encephalitis outbreak in New York is a powerful lesson for public health authorities,'' said Alan P. Zelicoff, a senior scientist at the Federal Center for National Security and Arms Control at Sandia National Laboratories in New Mexico. ''It is a sobering, not so reassuring, demonstration of the inadequacies of the U.S. detection network for emerging diseases.''

Local and Federal officials agree there is much to be learned from New York's experience that can be applied equally to defense against biological warfare and the emerging need to deal with the global spread of virulent disease.

While the public health system performed well in many regards, officials point to several key missteps. For instance, in testing samples from the initial victims, the C.D.C. screened only for six viruses common in this country. The scientists did not test for several that have been linked to foreign epidemics or germ warfare.

In addition, the scientist holding a key clue to the true identity of the virus, a bird specialist who had noticed the unexplained deaths of crows near the Bronx Zoo, could not get anyone at the C.D.C. to return her calls for a week. In the end, she turned to several other Government laboratories, including a military research center, to confirm her suspicions that the C.D.C. had the wrong virus.

Finally, the myriad state, local and Federal agencies involved in the investigation did not always communicate well with one another.

''We've learned about the need for, and benefits of, improvements in laboratory coordination,'' said Scott Lillibridge, who leads the C.D.C.'s Bioterrorism Preparedness and Response Program. ''We've also learned how helpful surveillance can be, particularly in beginning to track the beginning, extent or progress of an infectious disease outbreak.''

Over the past several years, the Federal Government has invested hundreds of millions of dollars on a national program to defend against biological terrorism. Several officials said that in light of New York's experiences, much more money should be invested in the public health systems detecting epidemics.

The Discovery : 2 Elderly Patients Sound an Alarm

On Aug. 23, **Dr. Deborah S. Asnis,** an infectious disease specialist at Flushing Hospital Medical Center in Queens, called the city's Health Department with some distressing news -- two elderly patients had come in with symptoms that looked like a neurological illness -- fever, muscle weakness and confusion.

Dr. [Dr. Marcelle C. Layton (born 1958)], who heads the Health Department's Bureau of Communicable Diseases, told Dr. Asnis to send samples to the State Department of Health, and then called the C.D.C. to warn them that something -- maybe botulism -- was happening in New York City. As the week went on, the number of sick people was starting to mount.

The case was assigned to Dr. Gubler, one of the C.D.C.'s experts on diseases spread by insects. His suspicions focused on St. Louis encephalitis, which is often found in the Southeastern United States.

To confirm his theory, **[Dr. Duane J. Gubler (born 1939)],** tested the samples for antibodies against six viruses transmitted by insects and commonly found in the United States. The tests came back positive for St. Louis encephalitis, a close relative of West Nile fever.

The C.D.C. announced on Sept. 3 that tests of blood and spinal fluid had confirmed Dr. Gubler's suspicion. The Mayor called a hasty news conference in Queens. His office of emergency management took the helm and began a $6 million campaign to wipe out New York's mosquitoes.

Within days, New York City had practically cornered the nation's supply of insect repellent, and 250,000 brochures about the disease were printed and distributed, along with the free repellent, by 500 city employees.

And New Yorkers quickly began to debate which thing unknown to their region they feared the most -- St. Louis encephalitis, or malathion, the insecticide that began to rain down from clacking helicopters.

At the Bronx Zoo, officials were worrying about what seemed to be a serious, but separate biological event. **Since July, zoo officials had been receiving calls from people in the Bronx and Queens about dead birds. Four days after the city's St. Louis encephalitis announcement, several exotic birds at the zoo were dead. But not emus. And that made Tracey S. McNamara nervous.**

Dr. McNamara, who is the head of the department of pathology at the zoo, knew that St. Louis encephalitis, which is carried by birds and transmitted through mosquitoes, does not normally kill the birds.

She considered the possibility that the birds were being killed by another common form of encephalitis. But that disease is deadly to emus, which were thriving. Something much more complicated was afoot, she reasoned.

The pathologist took to her lab, spending 12 hours a day analyzing bird samples. What she found was so disturbing, she said, that she called the C.D.C to alert them. The dead birds were bleeding from the brain and had badly damaged hearts. Was a similar virus infecting people?

"We had dead people and dead birds and I thought we needed to pursue this," she said.

She also contacted the National Veterinary Services Lab in Ames, Iowa, part of the United States Department of Agriculture, to study the samples. Around the same time, Ward Stone, the chief wildlife pathologist for the State Department of Environmental Conservation, began noticing large numbers of dead crows, and alerted his counterparts in New Jersey and Connecticut that something strange was happening to the local bird population.

While the C.D.C. agreed to take some of Dr. McNamara's samples, agency workers then did not return her daily calls for a week. "I got voice mail," she said. In fairness, she acknowledged, dead people were taking precedence.

But the agency seemed slow to grasp the possible link to the birds' illness. Dr. McNamara is circumspect about criticizing her colleagues at the C.D.C., but she said, "I would say a lesson to be learned was that there was some tunnel vision."

In the Federal Government's dress rehearsals of how a city might detect and handle a sudden outbreak of disease, officials had foreseen many different scenarios. But no one had anticipated an outbreak in which crucial evidence would be uncovered by a wildlife specialist.

"How we respond to introduced diseases in the wildlife perspective is not very well resolved," said Michael Samuel, a research project leader at the National Wildlife Health Center, a unit of the Department of Interior, which is also researching New York's outbreak. "I don't know that we as a nation have a contingency plan in place."

Dr. Stephen Ostroff, the acting deputy director for science and public health at the C.D.C., said that confusion is a normal part of an emerging diseases investigation.

"Anyone who continues to maintain that there was some mistake here doesn't understand the way science proceeds in outbreak investigations," Dr. Ostroff said. "You won't hear any apologies from me." He said he was not aware of Dr. McNamara's repeated attempts to reach C.D.C. officials.

The Breakthrough : Military Minds Turn to Outbreak

Back in the Bronx, Dr. McNamara was getting impatient. The veterinary lab in Ames had already exhausted its capabilities, but could not specifically identify the strange virus that was killing the birds.

Dr. McNamara sent more samples to the C.D.C., but she also put in a call to the United States Army Medical Research Institute of Infectious Diseases, looking for a favor.

Could the laboratory, which does not usually get involved with civilian requests, take a peek at her samples? Dr. McNamara, it turned out, had some chits to call in. She had recently attended the wedding of the pathologist who performs such tests. The lab agreed to take a look.

The system was working, after a fashion. The military's finest minds on bioterrorism had turned to New York's outbreak.

On Sept. 21, Dr. McNamara sent the samples to the lab by overnight mail. Within a day, the Army's unit, which is based in Fort Detrick, Md., confirmed that a virus of a very different sort was killing birds.

Meanwhile, the C.D.C. was beginning to make the connections. On the same day, officials at the agency called Dr. McNamara and said they wanted more material. She sent it out that evening.

On Sept. 24, scientists at the Army lab told her that the tests of bird samples for West Nile virus "really lit up," Dr. McNamara said.

The C.D.C., with help from each of the labs involved, had come to the same conclusion. That day, the agency announced that birds were dying in New York City, and a West Nile-like virus was the reason. The scientists strongly suspected that the humans had been killed by the same virus, but had yet to confirm it.

The answer came, strangely enough, from California. **The New York State Department of Health, without telling the C.D.C.,** sent some of the brain tissue from people believed to have died of St. Louis encephalitis to a lab run by [Dr. Walter Ian Lipkin (born 1952)], a scientist at the University of California in

Irvine who had bumped into state scientists at a conference in Albany.

On Sept. 24, [Dr. Walter Ian Lipkin (born 1952)] found that a form of West Nile virus -- which the C.D.C. now believes is similar to a strain previously found in Europe -- had sickened the New York patients. Soon after, the C.D.C. reached the same conclusion.

The words "West Nile virus" had little significance in New York. But in Washington, they raised red flags among American intelligence officials who follow bioterrorism, an incident reported by this week's New Yorker magazine.

In April, a supposed associate of Saddam Hussein published a book in Britain in which he claimed that the Iraqi leader had threatened in 1997 to unleash a form of West Nile virus against his enemies.

A closer look at the Iraqi biological weapons program found no evidence that Baghdad had ever experimented with the virus and intelligence officials, along with arms inspectors who had visited Iraq's laboratories, concluded the report was baseless.

Last night, the C.D.C. issued a statement saying it believed the West Nile outbreak was the work of "Mother Nature."

The eerie coincidence underscored what officials said was a new reality.

"Sadly the world has changed. The threat of bioterrorism is real and growing," said Dr. Margaret Hamburg, an assistant secretary at the Department of Health and Human Services who was previously head of the New York City Health Department. "Whenever a new or unexpected disease emerges in an outbreak such as this, it would be irresponsible not to at least consider the possibility of bioterrorism."

Congress, the officials said, has been slow to spend money on detecting outbreaks, even as they invest hundreds of millions in other bio-defense efforts and vaccines.

This year, lawmakers for the first time approved $120 million to strengthen the C.D.C.'s programs for education and monitoring disease. However, the $40 million set aside for improving state and local health detection was only disbursed late last month, as a West Nile-like virus was spreading through New York.

"We're spending hundreds of millions on questionable stockpiles of vaccines and antibiotics," said Dr. Zelicoff, the scientist at the Sandia Laboratory. "We should be improving the ability of local public health officials to recognize and report strange illnesses to a central authority that can quickly tell them what to do about it."

2020 (Sep 03) - ABC News : "As COVID-19 continues, experts warn of next pandemic likely to come from animals"

ByDr. Jonathan Chan andSony Salzman / September 3, 2020, 5:02 AM / Source : [HM001E][GDrive]

Included - **Dr. Tracey S. McNamara (born 1954)** ; Dr. Peter Daszak (born 1965)

Millions of deaths each year can be traced back to animal diseases, experts say.

Early cases of COVID-19 are believed to be linked to a live-animal market in Wuhan, China.

Even as the COVID-19 pandemic rages on, experts are warning that the next pandemic could arrive at any moment, and again, it could come from animals. To prevent history from repeating itself, experts say governments need to start investing heavily in pandemic prevention efforts.

That means deploying teams of biologists, zoologists and veterinarians to begin monitoring animals and the people who interact with them -- an army of scientists tasked with stamping out the next deadly virus before an animal disease balloons into a global pandemic.

According to the World Health Organization, approximately 1 billion cases and millions of deaths each year can be traced back to diseases originating from animal populations.

In the past three decades, researchers have found more than 30 bacteria or viruses that are capable of infecting humans. Over three quarters of those are believed to have come from animal populations.

And while the current pandemic may feel like a very rare happening, scientists say the pace of these pandemics is accelerating dramatically thanks to humans' ever-encroaching proximity to wildlife.

Beginning with SARS almost two decades ago and followed by West Nile, Ebola, Zika and currently, COVID-19, many of these pandemics originated with species of bats, and can be spread between people through coughing and sneezing or through insects such as mosquitoes.

"The time between these outbreaks is getting shorter and shorter," said [**Dr. Tracey S. McNamara (born 1954)**], a professor of pathology at Western University of Health Sciences College of Veterinary Medicine.

And it's becoming increasingly clear that these viruses aren't just a threat to our health -- they're also a threat to the global economy.

"We are only able to sustain an outbreak maybe once every decade," said [Dr. Peter Daszak (born 1965)], president of EcoHealth Alliance. "The rate we are going is not sustainable."

The COVID-19 pandemic did not surprise McNamara and Daszak. For decades, they, and other scientists, have been warning politicians and the public that wild and domestic animals -- and the viruses they carry -- pose a threat to humanity.

Without proper monitoring and surveillance of these creatures, they warned, we would be ill-prepared to stop a virus from spreading across the globe. [Dr. Tracey S. McNamara (born 1954)] was part of the "Red Dawn" group, a now-infamous email chain of top scientists that asked powerful U.S. government officials to mount a more vigorous domestic defense back when coronavirus was still considered a problem confined to China's borders.

And Daszak, who has spent much of his career hunting for the next pandemic-causing virus in bat caves in Asia, saw U.S. government funding for his science slashed back in April.

Perhaps most ominously, a U.S.-funded early-warning system called PREDICT, which was launched in 2009 in response to the H5N1 bird flu outbreak, saw its funding quietly lapse in late 2019. [Dr. Peter Daszak (born 1965)], whose group EcoHealth Alliance received some funding from PREDICT, lamented its loss at the time, arguing it's much cheaper for governments to stamp out small outbreaks than try to control a massive pandemic.

But there are some signs now, with the coronavirus pandemic in full swing, that funding to these crucial programs is coming back. PREDICT was granted an emergency six-month extension, and a new program, called Stop Spillover, is slated to launch in October.

And while it may be too late to stop this coronavirus in its tracks, scientists say the threat of the spillover event grows more imminent each year. As our population continues to expand, the interactions between humans and wildlife grow closer and closer. Cutting down forests and altering habitats push animals out of their own homes and deeper into human communities.

Poorly developed hygiene and sanitation systems can make it more likely for germs to build up. With humans and animals living in such close proximity, bacteria and viruses can easily jump from one species to another.

Once people become infected, the increasing interconnectedness of our world makes the spread of the disease easier. People and domestic animals are able to traverse the globe in a matter of hours. Illegal trade of exotic animals can move across borders undetected, carrying with them deadly bacteria and viruses.

"Several epidemiological drivers have been identified that make bacteria and viruses from animal populations suitable to emerge in a susceptible population. These drivers include climate change, industrial development, ecosystem change and social inequality," said Dr. John Brownstein, an epidemiologist, chief innovation officer at Boston Children's Hospital and contributor to ABC News.

So how do bacteria or viruses go from infecting animals to infecting humans?

One of the most common ways is coming into direct contact with the bodily fluids of an infected animal, such as a bat. This includes saliva, blood, urine and feces. Indirectly, people can come into contact with these through soil, plants, in animal habitats or by eating or drinking something that is contaminated.

Mosquitoes and ticks are two animals that are known to easily spread bacteria and viruses, including West Nile and Zika virus. After biting an infected person, mosquitoes and ticks are able to spread the virus to every subsequent person they bite.

According to [**Dr. Tracey S. McNamara (born 1954)**], rabies and plant diseases that can damage crops are the two diseases under surveillance in the United States.

"We don't think about it in the United States as much," said Dr. Christine Johnson, a professor of epidemiology and ecosystem health at the University of California--Davis School of Veterinary Medicine and director of the EpiCenter for Disease Dynamics. "There is a lot of active work to maintain vigilance for diseases. There is currently an outbreak of Ebola going on right now in the Democratic Republic of the Congo."

In Southeast Asia, efforts at identifying emerging diseases are focused on testing for viruses in both animals and people, especially in places where viruses can spill over, or find a new host, such as in humans, explained Daszak.

"We only know how to look for known diseases," said [**Dr. Tracey S. McNamara (born 1954)**]. Her vision is for a disease surveillance system to focus syndromes, a group of symptoms that are known to occur together.

By empowering veterinarians to share their findings with each other, McNamara hopes that this can help experts quickly identify the source of an outbreak before it spreads.

"Future efforts in zoonotic disease surveillance should include strong integration of animal and human agencies of health, including wildlife, agriculture and public health," added Brownstein.

West Nile virus takes strong hold

Work on vaccines for humans, horses is under way

Jane Lerner
and Melissa Klein
The Journal News

WHITE PLAINS — The West Nile virus mysteriously arrived in New York nearly two years ago and, after studying it for just as long, scientists still are puzzled by what its presence here means to people and animals.

International scientists who met at a three-day conference at the Crowne Plaza Hotel this week revealed clues about the mosquito-borne illness, but admit there is much they don't know.

"Nothing about this virus has been classic," said Tracey McNamara, a Bronx Zoo veterinarian who was among the first in 1999 to recognize that a new virus had emerged after birds began to die at the zoo.

Among the findings presented by researchers was evidence that birds may give the virus to other birds, rather than contract the disease through the bite of an infected mosquito.

While the common house mosquito, culex pipiens, has been suspected as the main culprit in transmission of the virus, researchers are now more closely investigating other mosquito species that also appear to play a role.

Even before those questions are answered, there already is preliminary work toward a vaccine by two pharmaceutical companies, one of which has started testing its version for horses. Horses also are susceptible to West Nile, and 28 became ill in New York last year.

West Nile sickened 18 people in New York and New Jersey last year and two of them died. In 1999, 62 people in New York became seriously ill, seven fatally.

As research into West Nile progresses, some scientists said they are limited in the work they can do by a lack of money.

McNamara said more money should be devoted to tracking the disease in animals, which could yield answers about the virus in humans. West Nile has killed thousands of birds and some mammals.

"The answer rests within the animals," she said. "The funding is still all going toward the humans."

There are many animal studies under way, among them research at the National Wildlife Health Center in Wisconsin, which is looking at how crows contract the virus. In laboratory experiments, infected crows passed the virus to other crows, possibly through their feces, said Robert McLean, the health center's director.

Researchers believe the virus will continue to spread this summer, although there is no certainty about how many people, if any, will become sick.

"This virus has taken a very strong hold in a very short time, and I think we would be irresponsible not to develop a vaccine, which is the most efficient way of protecting people against any infectious disease," said Dr. Thomas Monath, vice president of research and medical affairs at Acambis Inc. in Cambridge, Mass.

Monath said the company hopes to begin manufacturing a West Nile vaccine in January for clinical trials in humans. If the vaccine works, it could still take at least four years before it becomes available. Monath said test results on the horse vaccine are expected in a few months.

Pesticide company accused of improper supervision and training of apprentices

Melissa Klein
The Journal News

The company that sprayed pesticides to combat the West Nile virus last summer has been charged with violating state environmental law for not properly training or supervising 31 apprentice workers.

The violation notice given this week to Clarke Environmental Mosquito Management of Roselle, Ill., focuses on the spraying the company did in New York City, but an investigation is continuing into pesticide application in the suburbs, said Jennifer Post, a spokeswoman for the state Department of Environmental Conservation.

"Applicators are required to provide safety training on the proper use of pesticides, on proper techniques such as not spraying into the wind and also the use of safety equipment such as gloves and respirators," Post said. "They did not."

The company had contracts to spray the pesticide Anvil to kill mosquitoes carrying the West Nile virus during the last two years in Westchester and Rock-

U.S. bioterror plans ripped

West Nile a wakeup call: expert

By BRIAN KATES
DAILY NEWS STAFF WRITER

As scientists battle the fast-spreading West Nile virus, anti-terrorism experts hope that developing a network to track and stop the epidemic will provide an early warning system for defense against biological attack.

But right now, the U.S. "is totally unprepared to deal with new vector-borne epidemics" — like West Nile virus or those spread by more lethal germs in the terrorist inventory, said Duane Gubler, an internationally recognized expert at the Centers for Disease Control and Prevention.

"West Nile was a wakeup call. We would have been just as unprepared for any other new pathogen," said Gubler, who is leaving the CDC after 14 years as chief of its vector-borne infectious disease lab. "That is a real national security concern."

When the epidemic surfaced in Queens in 1999 — its first appearance in the Western Hemisphere — it caught the nation's fragmented and underfunded public health system completely off guard.

The disease has spread unchecked from New York to 44 other states. This year, it has infected 6,292 Americans, killing 133 — six of them in New York. Two fatalities — a 69-year-old Ridgewood, Queens, man and a 93-year-old man from Dyker Heights, Brooklyn — were reported in the city last month.

"We still haven't been able to get a coordinated program off the ground," Gubler said of the battle to stop the virus.

He and other experts interviewed by the Daily News said the war against West Nile and other emerging biothreats has been mired in agency turf wars and hampered by lack of communication among various branches of government.

Typical example: When Health and Human Services Secretary Tommy Thompson proposed transforming the U.S. Public Health Service Commissioned Corps, a little-known 6,000-member branch of the military, into a rapid-response force against bioterrorism, it was publicly opposed by the heads of the CDC and the Food and Drug Administration.

Four years after the U.S. outbreak, the battle against West Nile remains hamstrung by "bureaucratic jurisdictions that respond to various aspects of the diseases, with little coordination and no clear plan for communicating with the public," according to a study this year by the Trust for America's Health, a nonprofit research group.

"This is especially troublesome," the report said, "given that many of the potential agents for biological weapons are zoonotic" — that is, they originate in animals and spread to humans.

West Nile virus, a relative of yellow fever, is spread by mosquitoes that become infected when they feed on infected birds, mostly crows. They then transmit the disease to people when they bite.

Encephalitis enigma

It started with the mysterious discovery of clusters of dead crows around the city. By August 1999, hundreds of dead crows had been found at the Bronx Zoo. Pathologist Tracey McNamara, fearful that some unknown pathogen would attack the zoo's animals, began autopsies of the birds.

She found severely inflamed hearts and the worst brain damage she'd seen in 18 years of performing animal autopsies.

After six people from Whitestone, Queens, were admitted to Flushing Hospital Medical Center with high fever, altered mental state and headaches, the feds announced on Sept. 3 of that year that the cases were St. Louis encephalitis.

But McNamara wasn't buying it.

"On one hand, there were all these dead birds," she told The News. "They died of encephalitis. On the other hand, you had the people in Queens. That was encephalitis, too." The cases had to be related, she reasoned.

Problem was, birds don't get St. Louis encephalitis. It had to be something else.

As birds continued to die at the zoo, two federal laboratories ruled out St. Louis encephalitis.

As the crisis loomed, McNamara said, she made out her will. "I was scared," she told The News. "The dead birds had given us six weeks of warning before the first people started to die, but that warning was ignored."

As the Trust for America's Health put it, "Public and animal health exist as two distinct fields, separated in both organization and culture."

But efforts are being made, belatedly, to close the gap.

McNamara — who left the zoo after the West Nile debacle was made public — pioneered the National Zoological Surveillance Working Group. A network of more than 35 zoos nationwide, it monitors diseases in zoo animals to provide an early warning of viruses that could spread to humans.

The CDC has established the West Nile Interagency Working Group, which combines the resources of the departments of Health and Human Services, Commerce, Interior, Defense, Agriculture and Environmental Protection.

Since the Sept. 11 attacks, money has poured into the public health system.

"State and local governments can't spend it fast enough," said Jerome Hauer, former city emergency management director and now head of the federal Office of Public Health Preparedness.

Last month, the CDC announced it was giving $870 million — $20.9 million of it to New York City alone — to bolster public health preparedness for bioterrorism and outbreaks of infectious diseases like West Nile virus.

"There has been a great deal of progress in rebuilding public health infrastructure," Hauer said. "There is a long way to go."

AP

FIRST WARNING State wildlife pathologist Ward Stone holds a dead crow that was found in Montrose in Westchester County in April 2000. Crow was tested for the deadly West Nile virus at wildlife pathology facility in New Scotland, south of Albany.

Skeeter virus hits 10,000 – docs fight on

Since the outbreak of West Nile virus in Queens four years ago, the disease has spread to all but three states in the lower 48, infecting more than 10,200 people and killing 421.

The virus can enter the body in myriad ways.

An infected woman can pass it to her unborn child or to her nursing baby. It can also invade its victims through blood from an infected donor.

Blood screening has flagged at least 617 infected blood donors since testing began last July. But just last week, the Centers for Disease Control and Prevention reported that the test can't detect all donated blood units infected with the virus.

"We catch most of the people, but not all of them," said Dr. Lyle Petersen, chief of the agency's division of vector-borne diseases.

Meanwhile, the disease continues to spread. And there is no cure.

But no sooner had the '99 outbreak been confirmed as West Nile virus than researchers began hunting for a remedy.

"We sent two scientists to the CDC lab [at Fort Collins, Colo.] with the goal of cloning the envelope protein of the virus to use in constructing a genetically engineered vaccine," said Thomas Monath, chief scientist at Acambis, the front-runner in developing a vaccine.

The company applied for a research and development grant, and was awarded about $3 million by the National Institutes of Health.

Now, after successful trials with animals, the scientists have applied to conduct tests with humans.

But even if everything goes perfectly, Monath said, it could be seven years before the vaccine is on the market.

By then, hundreds of thousands of people could fall victim to West Nile.

"The way things are progressing," Monath said, "we expect there will be in the neighborhood of 10,000 to 20,000 cases a year."

In episode 46 of MicrobeWorld Video, filmed at the American Association for the Advancement of Science Meeting in Washington, D.C., Dr. Stan Maloy talks with Tracey McNamara, professor of pathology at Western University of Health Sciences College of Veterinary Medicine, about her role as the head pathologist at the Bronx Zoo during the 1999 West Nile virus outbreak in New York City. As several local residents were hospitalized with encephalitis of unknown origin, many crows and exotic zoo birds were dying off. It was determined that the patients had St. Louis encephalitis (SLE) which is transmitted to humans by mosquitoes that got the virus from infected birds. However, birds with SLE do not get sick and a possible connection between the dying crows and human cases was dismissed by many experts.

McNamara suspected there was more to this story because of the large number of birds that were also contracting encephalitis and struggled to make her voice and preliminary research heard that suggested a new disease may be emerging in North America. It wasn't until she connected with researchers at the US Army Medical Research Institute in Infectious Diseases (USAMRIID) in Ft. Detrick, Maryland, who quickly confirmed that the virus that was killing the crows and her birds at the Bronx Zoo was West Nile virus, a disease endemic to Africa and parts of Europe that also infects people.

McNamara's experience has made her a champion of One Health -- "a call to action for collaboration and cooperation among health science professions, academic institutions, governmental agencies, non-governmental organizations, and industries towards improved assessment, treatment, and prevention of cross-species disease transmission and mutually prevalent, but non-transmitted, human and animal diseases and medical conditions."

2011 (Sep 22) - Tracey McNamara, CONTAGION movie premiere, Technical Advisor 9-16-11

Dr. Tracey McNamara is a professor at WesternU College of Veterinary Medicine. Dr. McNamara served as technical adviser for the hit film CONTAGION starring Matt Damon and Gweneth Paltrow. Fellow College faculty and staff attended a screening with Dr. McNamara to celebrate her role on the film. This film documents this event and included a brief interview with Dr. McNamara after the screening.

2019-06-18-wikipedia-megatons-to-megawatts-program.pdf

The **Megatons to Megawatts Program**, successfully completed in December 2013, is the popular name given to the program which is also called the United States-Russia Highly Enriched Uranium Purchase Agreement. The official name of the program is the "Agreement between the Government of the Russian Federation and the Government of the United States of America Concerning the Disposition of Highly-Enriched Uranium Extracted from Nuclear Weapons", dated February 18, 1993.[1] Under this Agreement, Russia agreed to supply the United States with low-enriched uranium (LEU) obtained from high-enriched uranium (HEU) found to be in excess of Russian defense purposes. The United States agreed to purchase the low-enriched uranium fuel.

The original proposal for this program was made by Thomas Neff, a physicist at MIT, in an October 24, 1991 Op-Ed in *The New York Times*.[2] On August 28, 1992, in Moscow, U.S. and Russian negotiators initialed the 20-year agreement and President George H. W. Bush announced the agreement on August 31, 1992.[3] In 1993, the agreement was signed and initiated by President Clinton and the commercial implementing contract was then signed by both parties.

Terms of the program

Under this Agreement, United States and Russia agreed to commercially implement a 20-year program to convert 500 metric tons of HEU (uranium 235 enriched to 90 percent) taken from Soviet era warheads, into LEU (less than 5 percent uranium 235). The terms of the agreement required that it be implemented on commercial terms without government funds. The agreement named the Department of Energy as the executive agent for the US side.[4] The DOE appointed the newly privatized United States Enrichment Corporation (USEC) as the commercial agent, its executive program contractor. The Russian Federation designated Techsnabexport (TENEX), a commercial subsidiary of its Ministry for Atomic Energy (Minatom), as the agent to implement the program on commercial terms. On January 14, 1994, the commercial contract between USEC and TENEX (HEU-LEU Contract) was signed. The terms also required that the HEU be converted by dilution (downblending) to LEU in Russian nuclear facilities. USEC would then purchase the low-enriched fuel and transport it to its facilities in the US. The first shipment of LEU took place in May 1995.

The value of the process is in two components: the LEU Feed (feed component of natural uranium) and the work involved in the conversion process, measured as separative work units (SWU). Both have separate commercial values. Early disagreements on interpretations of the terms of the governmental and commercial agreements on this issue led to controversy and some delays. Although each shipment contains LEU, the commercial nature of the global uranium market defines the uranium and the enrichment components as separate commercial values and costs. The solution reached was for USEC to continue payments for the SWU component it purchased and also to transfer the equivalent of the LEU feed component to the Russian side. In March 1999, Minatom and the US Department of Energy signed the Agreement Concerning the Transfer of Source Material to the Russian Federation (the Transfer Agreement), and at the same time TENEX signed a Contract with a Group of Western Companies (Cameco, Canada; Cogema, France; Nukem, Germany/US) regarding the purchase of the LEU Feed. As years passed, numerous commercial contract terms were renegotiated and revised to accommodate mutual interests.

Summary of program

The Megatons to Megawatts program was initiated in 1993 and completed on schedule in December 2013. A total of 500 tonnes of Russian warhead grade HEU (equivalent to 20,008 nuclear warheads) were converted in Russia to nearly 15,000 tonnes tons of LEU (low enriched uranium) and sold to the US for use as fuel in American nuclear power plants. The program was the largest and most successful nuclear non-proliferation program to date. The first nuclear power plant to receive low-enriched fuel containing uranium under this program was the Cooper Nuclear Station in 1998.[5] During the 20-year Megatons to Megawatts program, as much as 10 percent of the electricity produced in the United States was generated by fuel fabricated using LEU from Russian HEU.[6]

During this period, on a comparatively modest basis, the US government has also been converting some of its excess nuclear warhead HEU into power plant fuel. Efforts have also been undertaken to demonstrate the commercial feasibility of converting warhead plutonium into fuel to augment nuclear fuel for US power plants.

Nuclear industry sources forecasted high demand trends that would require finding other uranium supply sources after the completion of the Megatons to Megawatts agreement.[6] In 2011, TENEX and USEC signed a long-term contract (Transitional Supply Agreement – TSA) for the provision of enrichment services to the United States that could see annual deliveries after 2015 reaching a level of around half the annual supply volume under the HEU Deal.[7] No plans have been announced for new initiatives similar to the Megatons to Megawatts program.

Timeline

1991

July 31, 1991. After nine years of negotiations, U.S. President George H.W. Bush and Soviet President Mikhail Gorbachev sign in Moscow the Strategic Arms Reduction and Limitation Treaty (START). The treaty reduces strategic warheads to 6,000 and deployed strategic delivery vehicles to 1,600 on each side, about a 40% reduction in the superpower strategic nuclear arsenals. The treaty is due to enter into force after ratification by the signatory parties

about a 40% reduction in the superpower strategic nuclear arsenals. The treaty is due to enter into force after ratification by the signatory parties.

August 19, 1991. A group of Soviet government hardliners stage a coup in Moscow, declaring a state of emergency to overcome "chaos and anarchy" threatening the USSR. President Gorbachev is confined at the government compound in Foros, Crimea. His nuclear launch authorization unit, the so-called nuclear suitcase, is disabled and removed to Moscow. By August 22, the coup is foiled and its perpetrators are detained. Soviet republics begin declaring independence from Moscow.

August 29, 1991. President Nursultan Nazarbayev of Kazakhstan decrees to close the Semipalatinsk Nuclear Test Site exactly 42 years to the day of the first Soviet nuclear test conducted there.

September 1, 1991. Sen. Sam Nunn (D-Ga.) visits Moscow and meets with President Gorbachev and Soviet Defense Minister Yevgeny Shaposhnikov. The visit convinces him of two things: "One, that there would be no more Soviet Empire. And two, that they and we had a huge, huge security problem." Upon his return, Nunn approaches the chairman of the House Armed Services Committee, Les Aspin (D-Wis.), who authored a proposal for a $1 billion humanitarian aid package to the USSR, and convinces Aspin to amend the approach to include targeted aid for dismantling the Soviet nuclear arsenal.

September 5, 1991. President Bush chairs a National Security Council (NSC) meeting where the possibility of the Soviet breakup and the idea of tactical and further strategic nuclear reductions is discussed. These ideas would materialize three weeks later as Presidential Nuclear Initiatives (PNIs).

September 6, 1991. Harvard's Graham Allison writes a private memorandum titled "Sounding the Alarm" to the Chairman of the Joint Chiefs of Staff Colin Powell, distributed also to National Security Advisor Brent Scowcroft, Counselor at the Department of State Robert Zoellick and other key figure in the administration. Allison, who found himself in Moscow during the coup, emphasizes: "Soviet disunion could create additional nuclear states, provoke struggles for control of Soviet nuclear weapons, and lead to a loss of control of strategic or non-strategic nuclear weapons."He recommends "extensive cooperative measures with the Soviet and Russian government to return all nuclear warheads to Russian territory immediately" to prevent the proliferation of so-called loose nukes.

September 12, 1991. Rep. Aspin authors a white paper called "A New Kind of Threat: Nuclear Weapons in an Uncertain Soviet Union." Aspin emphasizes the threat posed by Soviet nuclear arms caught in the middle of civil unrest and ethnic strife accompanying the disintegration of the USSR. "Many of the steps necessary to reduce nuclear risks associated with instability must be taken within the Soviet Union itself, from assuring the security of nuclear storage sites to promoting a more or less orderly transition to a much less centralized form of government."

September 27, 1991. President Bush, in an unprecedented unilateral move, announces the first round of PNIs that entail the withdrawal from Europe of all ground-launched and about half of naval tactical nuclear weapons to central storage facilities in the U.S. and their subsequent destruction, as well as de-alerting strategic nuclear systems. Bush also advances a proposal for eliminating ICBMs with multiple warheads (MIRVs), which eventually (in a modified form) becomes the START-II treaty. Bush suggests that the U.S. and USSR explore cooperation on safe and secure nuclear warhead command and control, storage, transport, dismantlement and destruction.

October 5, 1991. Gorbachev announces that the Soviet Union will reciprocate Bush's PNIs on non-strategic nuclear weapons and de-alerting a portion of the ICBM force and, further, proposes to eliminate an entire category of non-strategic nuclear weapons. Gorbachev declares a one-year moratorium on nuclear testing and urges the U.S. to do the same. He also proposes a no-first-use declaration by all nuclear powers.

October 7, 1991. U.S. Undersecretary of State Reginald Bartholomew meets with (the last) Soviet Foreign Minister Eduard Shevardnadze who praises the PNIs and admits that, although there is no need to worry about the loss of control over strategic weapons located in Russia, Ukraine, Belarus and Kazakhstan, the fears about tactical nuclear weapons are "in great measure justified." Shevardnadze also warns that civil war is imminent if the Soviet Union disintegrates.

October 18-24, 1991. A Soviet delegation, headed by Deputy Minister of Atomic Power and Industry Viktor Mikhailov, visits Washington, D.C. on the invitation of the Federation of American Scientists (FAS) and the National Resource Defense Council (NRDC) and meets with U.S. government officials and congressmen. Mikhailov assesses that if the Soviet Union is to destroy the 15,000 nuclear warheads earmarked for dismantlement under START and the PNIs over the next 7-9 years, it would require $2 billion just for new storage facilities. He urges Congress to fund a $400 million effort to assist Russia with dismantling nuclear weapons that would later become known as the Nunn-Lugar initiative.

October 24, 1991. Thomas Neff, an MIT physicist, publishes an op-ed in the New York Times titled "A Grand Uranium Bargain," suggesting that, in order to facilitate the disarmament process, the U.S. should buy or barter fissile material released from the Russian warheads slotted for dismantlement. Neff embarks on actively promoting the idea with the U.S. government.

October 1991. A U.S.-Russian working group on Safety, Security and Dismantlement (SSD) of Nuclear Weapons is established to facilitate the rapid and safe implementation of the PNIs. The U.S. delegation is led by Ambassador William Courtney, Dr. Robert Barker (Department of Defense) and Dr. James Turner (Department of Energy). The SSD is charged with reducing "the risks of both a nuclear weapon accident and loss of control of a nuclear weapon in either country," as well as facilitating "Soviet ability … to transport and store weapons they identify for retirement as a reciprocal response to … the President's initiatives."

November 1991. A group of authors from Harvard's Belfer Center—Kurt Campbell, Ashton Carter, Steven Miller and Charles Zraket—publish a report entitled "Soviet Nuclear Fission: Control of the Nuclear Arsenal in a Disintegrating Soviet Union." The report warns that the destiny of the 27,000 nuclear weapons on the territory of the uncertain Soviet Union is a paramount security concern. The report identifies three challenges: devolution of control over nuclear weapons to constituent republics, unauthorized seizure or use and proliferation of weapons and sensitive materials outside the Soviet Union. The authors recommend prompt implementation of PNIs and U.S. technical cooperation in transport, storage, disablement and dismantling of nuclear weapons and sensitive weapon-related components."

November 13, 1991. Sen. Nunn addresses the Senate stating that the U.S. is at a "unique juncture" in history when it could achieve "the greatest reduction in a former adversary's weaponry since the destruction of German and Japanese weapons" after WWII. He stresses that dismantling and destroying nuclear weapons requires two things that are in short supply in the Soviet Union—technology and resources—and urges Congress and the president to "invest wisely in a modest program" of technical assistance for demilitarization of the Soviet Union "that could produce dramatic dividends." Due to strong opposition to aid to the Soviet Union, however, Nunn is forced to withdraw the Nunn-Aspin bill. Despite this, Nunn proceeds to build bipartisan support for the idea by engaging Sen. Richard Lugar (R-In.) and others.

November 15, 1991. Sens. Nunn and Lugar meet with Sergei Rogov and Andrei Kokoshin of the Institute for U.S. and Canadian Studies of the Soviet Academy of Sciences (ISKAN); the Russians warn that nuclear weapons could be caught in a power struggle between the Soviet republics.

November 19, 1991. Ashton Carter presents the results of the Belfer Center's "Soviet Nuclear Fission" study to Sens. Nunn and Lugar and their staff. William Perry of Stanford University, John Steinbruner of Brookings Institution and David Hamburg of the Carnegie Corporation also attend the meeting.

November 21, 1991. Nunn invites 16 senators from both parties for a breakfast meeting where he and Carter brief them on the nuclear threat posed by the Soviet collapse. The senators give their approval to the Nunn-Lugar initiative to assist the Soviet Union with dismantling nuclear arms.

November 25, 1991. President Bush submits the START Treaty to the Senate for ratification.

November 25-27, 1991. The first round of U.S.-Soviet SSD talks take place in Washington, D.C., led by Undersecretary Bartholomew and Soviet Deputy Foreign Minister Alexei Obukhov. The sides broach discussions of safety, security and dismantlement of nuclear weapons per the PNIs. The head of the U.S. SSD working group, Amb. Courtney, relates a sense of urgency in rapid disablement of nuclear weapons slotted for destruction, citing risks of instability, armed conflict and accidental missile launch in the USSR. Courtney's Soviet counterpart, Sergei Zelentsov, chief engineer of the Defense Ministry directorate in charge of security of nuclear weapons, does not share the U.S. sense of urgency and remains skeptical about the need for U.S. assistance.

November 27, 1991. The Senate, in an 86-8 vote, passes the Soviet Nuclear Threat Reduction Act, authorizing the appropriation of $500 million from the Department of Defense (DoD) budget for Fiscal Year 1992, of which $100 million are designated for humanitarian assistance and $400 million for assisting with dismantling nuclear and chemical weapons in the Soviet Union. Allison describes the bill as "the most significant U.S. policy initiative toward Russia in the post-Cold War period."

December 8, 1991. Russian President Boris Yeltsin, Ukrainian President Leonid Kravchuk and Chairman of the Supreme Soviet of Belarus Stanislav Shushkevich meet at a hunting lodge in Belavezha Forest in western Belarus and sign an accord declaring that the Soviet Union as "a subject of international law and as geopolitical reality" has ceased to exist. The three Slavic republics form a Commonwealth of Independent States (CIS) and pledge to preserve "a single military strategic space" with "joint command" and "single control" over nuclear weapons. The Belavezha Accords, as the agreement becomes known, are ratified by the Ukrainian and Belarusian parliaments on December 10 and by the Russian parliament on December 12, 1991.

December 12, 1991. Secretary of State James Baker delivers an address at Princeton University outlining U.S. policy toward transformations in the Soviet Union. Baker declares that the U.S. does not want to see new nuclear states emerge and expects that Soviet nuclear weapons will remain under a common, unified command and control.

December 12, 1991. President Bush signs the Soviet Nuclear Threat Reduction Act into Public Law No. 102-228. Later, the program will be renamed Cooperative Threat Reduction (CTR). The law specifies the following objectives:

Facilitate transportation, storage, safeguarding and elimination of nuclear and other weapons;

Facilitate prevention of proliferation and establish verifiable safeguards;

Facilitate prevention of the diversion of weapons-related scientific expertise to terrorist groups or third-world countries;

Support demilitarization of defense-related industry and conversion of such industry and equipment to civilian purposes and uses;

Expand military-to-military and defense contacts between the U.S. and the independent states.

Congress, however, requires the executive branch to certify that the recipient of the Nunn-Lugar funds:

Make a substantial investment of its won in weapons destruction;

Forgo any military-modernization program that exceeds legitimate defense requirements and forgo the replacement of destroyed weapons of mass destruction;

Forgo any use of components of destroyed nuclear weapons in new nuclear weapons;

Facilitate U.S. verification of weapons destruction that is carried out with U.S. financial assistance;

Comply with all relevant arms control agreements;

Observe internationally recognized human rights.

Congress authorizes but does not appropriate the $400 million for the program. These funds would have to be reprogrammed from existing DoD Operations & Maintenance (O&M) accounts for FY92. The same pattern would be repeated for FY93.

December 1991. At an early interagency meeting on implementing the CTR legislation, the DoD general counsel Jack Beard proposes a way for the executive branch to meet the recipient-certification requirements included in the legislation. That approach would be followed every year until Congress lifted the certification requirements under the George W. Bush administration.

December 15-21, 1991. Secretary of State Baker visits the four Soviet republics where strategic nuclear arms are deployed—Ukraine, Belarus, Kazakhstan and Russia. He reiterates the U.S. position that no new nuclear states should emerge from the Soviet collapse and a single, collective command and control authority over the strategic nuclear weapons should be preserved.

December 16-20, 1991. U.S. and Soviet scientists from government- and public-sector organizations hold workshops in Moscow and Kyiv on Soviet warhead dismantlement and the best use of the $400 million authorized under the Nunn-Lugar act. The Soviet Ministry of Atomic Power and Industry (MAPI) presents a proposal to use the funds for the construction of a plutonium-storage facility under joint "safeguards."

December 16, 1991. At a retreat in Leesburg, Virgina, Secretary of Energy Admiral James Watkins and the directors of the U.S. nuclear labs discuss ways to help Soviet nuclear scientists and prevent brain drain from the former Soviet Union. They decide that the lab directors should engage with their Russian counterparts. The ensuing series of exchanges and programs, many funded by CTR, become known as lab-to-lab cooperation.

December 21, 1991. The CIS holds a summit in Alma-Ata, Kazakhstan, at which eight more Soviet republics join the grouping: Armenia, Azerbaijan, Kazakhstan, Kyrgyzstan, Moldova, Tajikistan, Turkmenistan and Uzbekistan. Belarus, Kazakhstan, Russia and Ukraine also sign the Agreement on Joint Measures on Nuclear Weapons, whereby Ukraine, Kazakhstan and Belarus pledge to withdraw all tactical nuclear weapons to Russia by July 1, 1992, and Ukraine and Belarus to eliminate strategic nuclear weapons on their territories by 1994 and join the international Treaty on the Non-Proliferation of Nuclear Weapons (NPT) as non-nuclear-weapons states. CIS members agree that Russia should succeed the USSR as a permanent member of the UN

Security Council. CIS member further elaborate the constitution of joint strategic forces and the decision-making process for nuclear use at a meeting in Minsk on December 30.

December 25, 1991. At 7 p.m. local time, in a televised address, Gorbachev resigns as president and commander-in-chief of the USSR. Immediately afterward, he transfers his "nuclear suitcase" to Russian President Yeltsin.

The Soviet flag is lowered over the Kremlin and replaced with the Russian tricolor. Soviet ambassador to the U.N. Yuri Vorontsov simply changes his title to Russian ambassador to the UN at midnight Moscow time and then sends UNSG Pérez de Cuéllar "Fax 2338" from the Kremlin stating: "Henceforth the name Russian Federation will be used in the United Nations instead of USSR."

December 26, 1991. The upper house of the Supreme Soviet of the USSR passes a declaration recognizing that due to the establishment of the CIS, the USSR ceases to exist and disbands itself.

The dissolution of the Soviet Union leaves 25% of the ex-country's ICBM force and 40% of its long-range strategic bomber force outside the territory of the Russian Federation. Ukraine inherits 176 silo-based ICMBs, 130 SS-19s and 46 SS-24s, each armed with multiple warheads, for a total of some 1,240 strategic warheads, 44 strategic bombers armed with almost 588 air-launched cruise missiles (ALCMs) and some 2,600 tactical nuclear weapons. Belarus inherits 81 land-mobile SS-25 ICBMs each armed with a single warhead and over 1,000 tactical nuclear weapons. Kazakhstan inherits 104 SS-18 silo-based ICBMs armed with a total of 1,040 warheads and 40 strategic aircraft armed with 370 ALCMs. All three former Soviet republics also inherit significant elements of the former Soviet nuclear research and production complex. In addition, Russia has an estimated inventory of 1,300 metric tons of highly enriched uranium (HEU) and somewhere between 120 and 170 metric tons of weapons-grade plutonium located at some 60 sites in hundreds of buildings.1

1992

January 15-20, 1992. Undersecretary Bartholomew leads the first interagency delegation to Moscow, Kyiv, Minsk and Alma-Ata,2 now capitals of the newly independent states, to discuss arms control, including the ratification and implementation of START, the Treaty on Conventional Armed Forces in Europe (CFE) and the NPT. Bartholomew mentions that the U.S. has funds, under the Nunn-Lugar program, to aid with weapons dismantlement, once the specific needs of the new states are better defined. Bartholomew also conducts another round of SSD talks in Moscow where the Russian side reiterates that the main bottleneck in the Russian process of dismantling warheads is lack of a fissile-materials storage facility.

January 28, 1992. President Bush in his State of the Union address announces a second installment of PNIs that entail the cancellation of development, production and procurement of certain strategic nuclear system programs. Bush further elaborates proposals for the START-II de-MIRV'ing treaty.

January 29, 1992. President Yeltsin responds with reciprocal measures to Bush's new PNIs, making specific commitments on the destruction of ground, naval and air non-strategic nuclear weapons, as well as a halt in production of a number of strategic nuclear systems.

January 29, 1992. President Yeltsin decrees to establish the Ministry of Atomic Energy of the Russian Federation, or Minatom, which oversees most of the Russian nuclear complex.

February 1, 1992. Yeltsin pays his first official working visit to the U.S. He meets with President Bush at Camp David.

February 10-14, 1992. The first visit in the series of exchanges between U.S. and Russian nuclear labs takes place. Directors of the Russian nuclear labs—Vladimir Belugin of VNIITF at Snezhinsk, formerly the closed city of Chelyabinsk-70, and Vladimir Nechai of VNIIEF at Sarov, formerly the closed city of Arzamaz-16—travel to the U.S. to visit nuclear labs and meet with their U.S. counterparts: John Nuckolls, director of Lawrence Livermore National Laboratory (LLNL), and Siegfried Hecker, director of Los Alamos National Laboratory (LANL).3

February 14, 1992. Secretary Baker visits the Soviet nuclear lab VNIITF. Its leadership informs him that the average employee salary is $15 per month and gives him a list of civilian-use products the facility can manufacture with U.S. investment.

February 17, 1992. Foreign ministers of Russia, the U.S. and Germany release a statement about the establishment of a Science and Technology Center intended to support Soviet nuclear scientists and prevent "brain drain" out of the FSU.

February 23-29, 1992. The U.S. nuclear lab directors, Hecker of LANL and Nuckolls of LLNL, pay a reciprocal visit to Russian nuclear labs.

Mid-February 1992. Drawing on the results of SSD negotiations, Secretary Baker proposes U.S. CTR assistance to Russian Foreign Minister Kozyrev in the following areas:

- Armored blankets;
- Emergency response equipment;
- Safe, secure railcars;
- Fissile-materials containers;
- Nuclear-materials storage;
- National system of materials protections, control and accounting (MPC&A);
- Fissile-materials disposition facility (FMDF).

DoD designates the Defense Nuclear Agency (DNA) to contract and project-manage CTR-funded programs.

March 2, 1992. Viktor Mikhailov, a nuclear scientist and deputy minister of atomic power, is promoted to the post of minister at Minatom. He would serve in this role until 1998.

April 1992. Belarus announced the completion of the withdrawal to Russia of all the tactical nuclear warheads deployed on Belarusian territory.

April 19, 1992. DoE's Victor Alessi and DoS's Robert Gallucci author a memorandum outlining general guidelines for scientific cooperation between Russian and U.S. nuclear weapons labs. This informal DoE-DoS agreement would continue to guide U.S.-Russian lab-to-lab collaboration and exchanges.

April 28-May 2, 1992. As part of the SSD talks, Sandia National Laboratory (SNL) hosts a large Russian delegation led by Anatoly Belov of the Russian Foreign Ministry and Georgy Tsyrkov of Minatom. The U.S. SSD delegation is led by DoS's Gen. William F. Burns, who replaced Amb. Courtney, and includes

representatives of DoD and DoE, as well as nuclear scientists. The delegations hold detailed technical discussions in areas of SSD cooperation outlined earlier, such as the provision of armored blankets, railcars, fissile-material containers and accident-response equipment totaling $145 million in CTR funds.

May 5, 1992. The Russian military announces that all tactical nuclear weapons have been removed from Ukraine to Russia, ahead of the July 1 deadline.

May 10, 1992. Secretary of Energy Watkins testifies before U.S. Congress that for the first time since 1945 the U.S. is not building nuclear weapons.

May 23, 1992. Belarus, Kazakhstan, Russia and Ukraine sign an Annex to START I in Lisbon, Portugal, whereby all four states are recognized as successors of the USSR in respect to the treaty. Article V of the Lisbon Protocol, as the document becomes known, obligates Ukraine, Belarus and Kazakhstan to join the NPT as non-nuclear weapon states "in the shortest possible time." Attached to the Lisbon Protocol are letters from Kravchuk, Nazarbayev and Shushkevich pledging that their countries will eliminate all nuclear weapons from their territories within the seven-year period provided by START.

June 16-17, 1992. President Bush and President Yeltsin meet for their first summit in Washington, D.C., where on June 17 they sign a declaration of "strategic partnership." Bush and Yeltsin also conclude the Agreement Concerning the Safe and Secure Transportation, Storage and Destruction of Weapons and the Prevention of Weapons Proliferation, or SSD agreement for short. The agreement sets for a seven-year period the general framework for CTR-funded projects. The U.S. and Russia initial three CTR implementing agreements: on provision of armored blankets, on fissile-material containers and on nuclear accident response equipment.

Bush and Yeltsin, June 1992

July 2, 1992. The parliament of Kazakhstan ratifies START I and the Lisbon Protocol.

July 1992. The first shipment of 200 sets of armored blankets for warhead transportation arrives in Moscow from U.S. army storage depots in Europe. By June 1993, the U.S. would deliver some 700 sets of armored blankets.

July 1992. The U.S. and Russia sign an implementing agreement "Concerning Safe, Secure and Ecologically Sound Destruction of Chemical Weapons," initially committing $25 million of CTR funds to the project.

August 28, 1992. DoD's John Birely and Minatom's Mikhailov sign an implementing agreement on the provision conversion kits to modify up to 100 cargo railcars and 15 guard railcars to enhance physical security of nuclear warheads and materials during transportation, pledging $20 million in CTR funds. Subsequently, a sample Soviet railcar is shipped to SNL in Albuquerque, New Mexico, for development of prototype conversion kits.

September 23, 1992. The U.S. conducts its last underground nuclear test.

October 1, 1992. The U.S. Senate ratifies START I.

October 2, 1992. President Bush signs legislation containing the Hatfield Amendment establishing a nine-month unilateral nuclear testing moratorium. President Clinton will subsequently extend the moratorium through 1996.

October 5, 1992. The U.S. and Russia sign a CTR implementation agreement dedicating $15 million to develop a design for a fissile-material storage facility (FMSF). A joint U.S.-Russian team complete the design by June 1993.

October 22, 1992. The U.S. and Belarus sign a CTR umbrella agreement and two implementing documents: one on the provision of emergency-response equipment and associated training with $5 million of CTR funds committed; and another for setting up and equipping an export-control system for identifying and controlling nuclear materials worth $1 million.

October 26, 1992. Belarus announces that it has finalized the schedule for the withdrawal of SS-25 units from its territory. The withdrawal would conclude in November 1996.

November 4, 1992. The Russian Duma ratifies START I and the Lisbon Protocol, but makes its entry into force conditional on the accession to the NPT of Ukraine, Kazakhstan and Belarus.

November 27, 1992. Russia, the U.S., Japan and the European Union sign an agreement on the establishment of the International Technology and Science Center (ITSC) in Moscow. ITSC's mission is to provide research support for weapons scientists in Russia and the former Soviet Union to engage in peaceful civilian science projects. The Russian Duma never ratifies the agreement and it enters into force only provisionally in March 1994. Eventually, it grows to involve 36 state-partners and opens regional offices in Georgia, Armenia, Kazakhstan, Kyrgyzstan and Tajikistan.

December 1992. U.S. and Russian experts meet at LANL to discuss the engineering design and monitoring system for the fissile-material storage facility to be constructed in Russia for housing nuclear materials extracted from dismantled Soviet nuclear warheads.

1993

FY1993. DoD authorization legislation for CTR projects is expanded to include dismantlement of missiles and missile launchers; elimination of destabilizing conventional weapons; establishment of science and technology centers; environmental restoration; defense conversion; and military-to-military contacts.

January 1993. Harvard's Allison, Carter and others publish a report entitled "Cooperative Denuclearization: From Pledges to Deeds," in which they argue that increased urgency and immediate assistance are needed to achieve safe disarmament in Russia and denuclearization of the non-Russian republics. Nuclear dangers created by the dissolution of the Soviet Union, including unauthorized launch, accident or illicit sale of a warhead, cannot be deterred in the traditional sense and can be tackled only by cooperative engagement with the former Soviet states that are undergoing profound political, economic and societal transformation. The report offers detailed policy recommendations on all aspects of the U.S.-Russian nuclear relationship, including arms control and nuclear security.

January 1993. The U.S. and Belarus sign an implementation treaty for a CTR-funded project to equip with communications systems and train the personnel of the Belarusian National Agency for Arms Control and Inspections.

January 3, 1993. Presidents Yeltsin and Clinton sign START II, a treaty that bans all ICBMs with multiple, independently targetable reentry vehicles (MIRVs) and makes further reductions to between 3,000 and 3,500 deployed nuclear warheads on each side. START II never enters into force.

January 13, 1993. The Chemical Weapons Convention (CWC) is opened for signature. By the end of the month both the U.S. and Russia sign on. The CWC would enter into force on April 29, 1997, obligating parties to eliminate all chemical weapons stockpiles within a decade, which in the U.S. amounted to

would enter into force on April 29, 1997, obligating parties to eliminate all chemical weapons stockpiles within a decade, which in the U.S. amounted to approximately 30,000 tons and in Russia to some 40,000 tons of chemical agents.

February 4, 1993. The Belarusian parliament votes to ratify START and the Lisbon Protocol and accede to the NPT.

February 18, 1993. The head of the U.S. SSD delegation, Gen. Burns, and Russian Atomic Energy Minister Mikhailov sign in Washington a U.S.-Russian agreement on the disposition of the HEU extracted from dismantled Soviet nuclear weapons. The agreement, based on the idea conceived by Tom Neff in 1991, provides a framework for the U.S. purchase of 500 metric tons of HEU from Russia, to be first blended down to low-enriched uranium at the facilities in Russia and then transferred to the U.S. for use in nuclear-power reactor fuel.

March, 1993. U.S. Secretary of State Warren Christopher pledges $65 million in CTR funds to Belarus to assist with its denuclearization.

March, 1993. Three CTR implementation agreements with Russia are finalized:

On strategic nuclear delivery vehicle dismantlement;

On fissile-material storage facilities; and

On equipment and material control and accounting.

The agreements are submitted for review to the relevant Russian ministries.

March 24, 1993. President Clinton issues Presidential Decision Directive (PDD)-3, "U.S. Policy on the Ratification and Implementation of START I and START II and the Denuclearization of Ukraine, Belarus and Kazakhstan," designating these issues as priority objectives of U.S. foreign, security and nonproliferation policy.4

April 4-5, 1993. At the U.S.-Russian summit in Vancouver, Canada, the Clinton administration pledges a $1 billion aid package to support market and democratic reforms in Russia.

April 28, 1993. Secretary of Defense Les Aspin assigns overall policy guidance for the CTR program to the Assistant Secretary of Defense for International Security Policy, a post occupied at the time by Ashton Carter.

June 15, 1993. At a meeting of CIS defense ministers, CIS commander-in-chief Marshal Shaposhnikov announces his resignation. Subsequently, CIS Joint Armed Forces are disbanded.

June 15, 1993. The U.S. completes the delivery of 2,520 protective armored blankets for the transportation of nuclear warheads to Russia and continues the deliveries of emergency-response equipment to Russia and Belarus.

July 5-6, 1993. SSD delegation visits Minsk to finalize CTR agreements in additional three areas:

Environmental restoration and clean-up of SS-25 bases ($25 million);

Conversion of strategic rocket bases and other defense-related facilities to civilian use ($20 million);

Military housing and retraining programs for former officers of the Strategic Missile Forces, or SMF ($10 million).

July 27, 1993. U.S. Secretary of Defense Les Aspin and Ukrainian Minister of Defense Kostyantin Morozov sign in Kyiv a memorandum of understanding on $175 million in CTR assistance to Ukraine.

August 23, 1993. DoD and the Russian government sign the implementing agreement "Concerning Cooperation in the Elimination of Strategic Offensive Arms (SOAE)," with the U.S. pledging $130 million in CTR funds. The project entails provision of U.S. equipment for transport and elimination of liquid ICBM fuel, silo, submarine launcher and long-range bomber elimination and emergency-response equipment.

September 2, 1993. Ambassador James Goodby, who in March 1993 replaced Gen. Burns as the head of the U.S. SSD delegation, and Deputy Atomic Energy Minister Nikolai Yegorov sign an implementing agreement for $75 million in CTR funds on assistance in construction and equipping of an FMSF. In 1997, the project would receive an additional $84 million.

September 2, 1993. The U.S. government and Minatom sign the implementing agreement on a nuclear MPC&A system, dedicating $10 million in CTR funds. MPC&A systems provide the capability to deter, detect, delay and respond to possible adversarial acts or other unauthorized use of nuclear material and, if necessary, to aid in their recovery. Subsequently, MPC&A would grow to include projects in Ukraine, Belarus and Kazakhstan, funded from the CTR budget, and in Lithuania, Latvia and Uzbekistan, funded from the DoE overhead budget. MPC&A becomes one of the largest and most successful programs in the history of CTR. By 2012, the U.S. will have spent some $4 billion to strengthen MPC&A systems in the FSU.

September 22, 1993. Under the auspices of lab-to-lab cooperation, the first joint U.S.-Russian scientific experiment is conducted at VNIIEF on a high-current generator.

October 11, 1993. The Soviet Nuclear Threat Reduction Act evolves into the Cooperative Threat Reduction Act of 1993, with emphasis on:

Warhead removal from the Soviet successor states to Russia;

Destruction and dismantlement of weapons systems;

Chain of custody projects;

Chemical weapons destruction assistance;

Demilitarization support.

October 25, 1993. U.S. and Ukraine sign the umbrella CTR agreement.

October 25, 1993. Ukraine, the U.S., Sweden and Canada sign an agreement to establish a Science and Technology Center in Ukraine (STCU) designed to provide research grants to Ukrainian scientists and prevent brain drain. President Kravchuk would bring the STCU agreement into force on May 4, 1994, after which the center becomes fully operational. In the years that follow, Japan, the EU, Germany and other countries become STCU contributors.

November 18, 1993. Ukraine's parliament votes to ratify START I and the Lisbon Protocol with extensive reservations and with the exclusion of Article V,

obligating it to join the NPT as a non-nuclear weapons state.

December 5, 1993. DoD's Gloria Duffy and the head of Ukraine's Strategic Nuclear Forces Administrative Control Center General Aleksei Kryzhko sign the first CTR implementing agreement on Strategic Nuclear Arms Elimination with an initial commitment of $135 million. Shortly thereafter, implementing agreements on an MPC&A system, defense conversion and military housing are signed.

December 13, 1993. DoD and Kazakhstan's Ministry of Science and New Technologies sign the agreement "Concerning the Destruction of Silo Launchers of Intercontinental Ballistic Missiles, Emergency Response and the Prevention of Proliferation of Nuclear Weapons" that serves as the umbrella CTR agreement, with an initial $85 million pledge. A further five CTR implementing agreements are signed on the same day.

December 13, 1993. Kazakhstan's parliament votes to accede to the NPT during the visit of Vice President Al Gore to Almaty.

December 1993. DoE and Minatom sign agreements on improving the safety of Russian nuclear reactors and to allow, by the end of 1994, bilateral inspection of some facilities that stored plutonium.

December 1993. DoE and the Ukrainian government sign an MPC&A implementing agreement, providing for improvement in MPC&A systems at four locations: Kharkiv Institute of Physics and Technology, Kyiv Institute for Nuclear Research, South Ukraine Nuclear Power Plant in Zaporizhia and Sevastopol Naval Institute.

December 1993. DoE and Kazakhstan sign an MPC&A implementing agreement, providing for improving MPC&A systems at four sites: Aktau BN-50 Breeder Reactor, Ulba Fuel Fabrication Plant, Almaty Research Reactor and Semipalatinsk-21 facility.

1994

January 1994. William J. Perry becomes secretary of defense. Under his leadership, DoD expands CTR programs, including authorizing the use of $40 million in CTR funds for a new Defense Enterprise Fund (DEF) designed to promote joint ventures in conversion and defense between U.S. firms and those in the FSU.

January 14, 1994. Russian state-owned company Tekhsnabexport (Tenex) and the United States Enrichment Corporation (USEC) sign a $12 billion, 20-year contract for the sale of 500 metric tons of HEU, implementing the agreement signed in February 1993. The deal is signed at the Kremlin in the same room where Soviet government and nuclear scientists first held a meeting about the Soviet bomb in 1945.

January 14, 1994. At the same meeting, the U.S., Russia and Ukraine sign a Trilateral Statement that outlines the main terms of Ukraine's nuclear disarmament. Russia agrees to compensate Ukraine for the value of HEU released from tactical and strategic nuclear warheads removed from Ukraine's territory in the form of nuclear fuel assemblies for Ukraine's power reactors and by forgiving part of Ukraine's energy debt to Russia. The statement noted that a minimum of $175 million in CTR funds will be dedicated to technical assistance projects in Ukraine. U.S. and Russia also pledge "security assurances" to respect Ukraine's territorial integrity and not to threaten it with nuclear weapons.

January 1994. During a visit to LANL, VNIIEF director Vladimir Belugin and LANL director Sig Hecker sign a memorandum of understanding, proposing areas of cooperation between the labs, including on nuclear MPC&A that involves the security of Russian nuclear materials and warheads.

February 3, 1994. The Ukrainian parliament removes reservations and ratifies START I and the Lisbon Protocol unconditionally.

March 17-22, 1994. U.S. Secretary of Defense Perry and Assistant Secretary Carter visit Moscow, Almaty, Minsk and Kyiv. While in Ukraine, Perry and Carter visit one of the ICBM sites at Pervomaisk and a missile production facility in Dnipropetrovsk.

April 1994. DoE's government-to-government approach to joint MPC&A cooperation with Russia is revised and augmented by lab-to-lab involvement, which helps to advance work on the MPC&A program.

May 3, 1994. A separate program office for CTR is established within the Office of the Assistant to the Secretary of Defense for Atomic Energy in order to "strengthen and hasten implementation of the CTR program." One agency that interfaces with the office in the CTR arena at the technical and expert level is the Defense Nuclear Agency (DNA).

June 23, 1994. U.S. Vice President Gore and Russian Prime Minister Viktor Chernomyrdin sign an agreement pledging to permanently end the operation of plutonium production reactors at Mayak Chemical Metallurgical Combine in Ozersk and Siberian Chemical Combine at Seversk by 2000, as well as to prohibit the restarting of reactors that are already closed.

June 1994. Hecker, now at SNL, travels to Russia to sign pilot lab-to-lab MPC&A agreements with three facilities: VNIIEF, VNIITF and the Kurchatov Institute.

July 1994. Russian and U.S. specialists exchange visits to the U.S. plutonium storage facility at Hanford, Washington, and the Russian plutonium storage facility at Mayak in Ozersk in the northern Urals. At Mayak, some 30 tons of plutonium is in storage at the time.

July 20, 1994. The new Belarusian leader, President Alexander Lukashenko assumes office. Under his leadership, Belarus becomes much less cooperative with the U.S. government, until CTR projects collapse completely in 1997.

July 1994. The Russian government begins the construction, with CTR assistance, of an FMSF for 25,000 containers at the Mayak facility within the nuclear complex in Ozersk, formerly Chelyabinsk-65.

September 15, 1994. President Yeltsin issues a decree on urgent measures to improve the system of accounting for and storing nuclear materials. The decree is a response to a series of highly publicized incidents of theft and smuggling of Russian nuclear materials, revealing serious gaps in MPC&A systems.

September 21, 1994. President Clinton issues PDD-30, "U.S Nuclear Posture and Policy on Nuclear Arms Control Beyond the START I and START II Treaties," stating, among other things, that DoD "will continue to support Nunn-Lugar programs to reduce the danger of unauthorized or accidental use or diversion of weapons or materials from and within the Former Soviet Union."

November 16, 1994. The Ukrainian parliament votes to have Ukraine accede to the NPT as a non-nuclear weapons state.

November 20-21, 1994. In a secret U.S.-Kazakhstani operation code-named "Project Sapphire," two U.S. C-5 cargo planes airlift 600 kg of HEU from Ulba Metallurgical Plant in Ust-Kamenogorsk in northern Kazakhstan to DoE's Oak Ridge facility in Tennessee. These C-5 nonstop flights (with three air-to-air refuelings) from Ust-Kamenogorsk to Dover AFB become the longest in history. Kazakhstan is compensated with about $20 million in CTR funds, as well as

refuelings) from Ust-Kamenogorsk to Dover AFB become the longest in history. Kazakhstan is compensated with about $20 million in CTR funds, as well as in non-cash assistance, for the value of the removed HEU.

December 5, 1994. At a summit of the Conference for Security and Cooperation in Europe in Budapest, Hungary, the U.S., Russia, the UK and Ukraine sign a memorandum on security assurances in connection with Ukraine's accession to the NPT. Similar assurances are also pledged to Belarus and Kazakhstan. China and France extend security assurances to the three former republics in separate statements. Pursuant to Ukraine's submission of NPT ratification instruments, START enters into force.

December 16, 1994. Minatom's Mikhailov and U.S. Secretary of Energy Hazel O'Leary sign the Warhead Safety and Security Exchange Agreement (WSSX). The agreement provides guidelines for cooperation to enhance the safety and security of nuclear warheads in Russia. The agreement will enter into force on June 1, 1995. The program results in a series of working groups, seminars, and exchanges between U.S. and Russian nuclear labs, especially SNL and VNIIA.5 This collaboration yields the design and provision to Russian nuclear warhead storage sites of equipment for mitigating accident consequences and providing authenticated monitoring and control, some of which was funded by CTR.

December 1994. USEC places the first order for LEU blended down from 6 metric tons of HEU, the maximum Russia is able to process for delivery in 1995.

FY1994. The Clinton administration decides to include funding for CTR programs as a separate title in DoE's budget and State's budget.

1994. DoE establishes the Initiatives for Proliferation Prevention (IPP) program with the objective of attracting U.S. businesses to laboratories and institutes of the former Soviet Union, with technology evaluations from the U.S. nuclear labs. IPP, which started operation as Industrial Partnership Program in 1992, received $35 million in FY94 appropriations.

1995

January 1995. The U.S. DoD and Russia's Minatom agree to add $20 million in CTR funds for joint MPC&A upgrades. Similar agreements are signed with Kazakhstan, Belarus, and Ukraine. Eventually, the two sides agree to cooperate on MPC&A upgrades at five locations: Institute of Physics and Power Engineering in Obninsk, NIIAR in Dmitrovgrad, NPO Luch in Podolsk, Mayak Chemical Metallurgical Combine in Ozersk (formerly Chelyabinsk-65) and Production Association Machine Building Plant in Elektrostal.6 Due to secrecy concerns and limited access to Russian HEU facilities, however, only $1.5 million of the dedicated funds are spent by mid-1995.

February 1995. Demonstrations are held at the first two facilities that completed MPC&A upgrades, at Building 116 of the Kurchatov Institute in Moscow and at VNIIEF in Sarov.

March 1, 1995. U.S. President Clinton announces that 200 metric tons of fissile material will be withdrawn from the U.S. nuclear stockpile and called for it to be rendered unusable for future military purposes.

April 25, 1995. Russian SMF commander Igor Sergeyev announces the completion of transfer of nuclear warheads from Kazakhstan to Russia.

May 1995. In a joint Russian-Kazakhstani operation, a nuclear explosive device is removed from Tunnel 108k at the Semipalatinsk nuclear test site, four years after it was placed there by the Soviet military in preparation for a test.

May 10, 1995. Presidents Clinton and Yeltsin issue a Joint Statement on Nonproliferation reaffirming the two states' commitment "to strengthen national and international regimes of control, accounting and physical protection of nuclear materials and to prevent illegal traffic in nuclear materials."

June 1995. DoE and Belarusian government sign an MPC&A implementing agreement, providing for MPC&A systems upgrades at the Minsk Institute of Nuclear Power Engineering at Sosny.

June 1995. On the sidelines of a meeting of the Gore-Chernomyrdin commission, DoE Secretary O'Leary and Minatom's Mikhailov sign a joint statement initiating site surveys in the five locations selected for MPC&A upgrades, which finally launched these MPC&A projects in earnest. At the same time, DoE and GAN, the Russian nuclear regulatory agency at the time, sign an agreement for cooperation on creating a standardized national system for safeguarding nuclear material and providing MPC&A upgrades at six additional sites in Russia.7

June 1995. The first two shipments of blended-down Russian HEU arrive in the U.S. under the Megatons to Megawatts program.

August 1995. Graham Allison testifies before the U.S. Senate, warning that the threat of loose nukes persists and calling for the expansion of CTR funding to secure the "30,000 nuclear weapons that are still left there; more than 1,000 tons of highly enriched uranium that are still left there; more than 100 tons of plutonium that are still there in place" in Russia.8

August 1995. DoE initiates the lab-to-lab Warhead Dismantlement and Fissile Material Transparency Program (WD&FMT) in order to develop a cooperative regime and transparency in warhead dismantlement and destruction under the PNIs.

October 3, 1995. The U.S. and Kazakhstan sign a CTR agreement to close the tunnels used for nuclear testing at the Semipalatinsk site. The project would spend $6 million to seal off—through explosion-induced collapse and concrete reinforcement—the portals to some 181 tunnels and 13 experimental shafts.

September 28, 1995. President Clinton signs PDD-41, which lays out the policy for strengthening MPC&A systems in the FSU and assigns formal responsibility for directing MPC&A projects to DoE.

1995. DoE and Minatom begin cooperation at Mayak, Luch, NIIAR, VNIITF and Seversk.

1995. DoE and Minatom launch a project for personnel training and skill enhancement at the Methodological and Training Center for Nuclear Materials Accounting and Control, Interdepartmental Special Training at Obninsk.

1995. DoE and Minatom begin work on safe transport of nuclear materials and creation of automated security system for transporters of nuclear materials at Eleron Design Bureau for Auto Transport Equipment.

1995. The project on a Federal Information System for Nuclear Materials Accounting and Control is launched at Minatom's Central Scientific Research Institute of Management, Economics and Information.

1995. DoE and Minatom begin cooperation at the Novosibirsk Chemical Concentrates Plant, Radium Institute (St. Petersburg), Beloyarsk Nuclear Power Plant (Zarechny), Urals Electrochemical Integrated Plant (Novouralsk), Mining and Chemical Combine (Zheleznogorsk), Scientific Research and Design Institute of Power Technology (NIKIET, Moscow), Siberian Branch of NIKIET (Zarechny), Institute of Theoretical and Experimental Physics (ITEP, Moscow) and Electrochemical Plant (Zelenogorsk).

and Electrochemical Plant (Zelenogorsk).

1996

FY1996. The Clinton administration transfers funding responsibility for certain activities out of the DoD budget request to the DoS and DoE budget requests. DoS becomes responsible for a WMD Scientist Redirection Program and the Export Controls and Border Security Program, and continues to fund the Nonproliferation and Disarmament Fund (NDF). DoE takes over MPC&A programs and a new program on transforming and downsizing Russia's large nuclear research and fissile-material production facilities.

March 1996. A new MPC&A system is commissioned at Salaspils Institute of Physics in Latvia. The project is carried on with DoE funding and in cooperation with the IAEA.

March 21, 1996. President Clinton issues PDD-47 declaring that sustaining the scientific competence of individuals responsible for ensuring confidence in the Russian and U.S. nuclear stockpiles is a national priority.

May 1996. A new MPC&A system is commissioned at a facility in Tbilisi, Georgia.

May 31, 1996. The last shipment of nuclear warheads leaves Ukraine's territory for Russia.

June 26-27, 1996. Congress passes the Defense Against Weapons of Mass Destruction Act of 1996, also known as the Nunn-Lugar-Domenici Amendment. The bill expands existing Nunn-Lugar work to include domestic preparedness for WMD terrorism. It also expands funding for DoE lab-to-lab cooperation, particularly the MPC&A project.

July 1996. A new facility for liquid missile propellant neutralization and missile disassembly, built with $27 million in CTR funds, opens in Dnipropetrovsk, Ukraine.

July 1996. U.S. and Russia sign a CTR agreement on Chemical Weapons Destruction Program to design, build and equip the first Russian CW destruction complex near Shchuchye in Siberia, eventually committing close to $1 billion in CTR funds.

1997

February 1997. U.S. and Russia agree to extend lab-to-lab cooperation on high-energy physics for five years.

May 1997. Commencement of a $54 million CTR project to design a new Solid Propellant Disposition Facility near Votkinsk in Russia.

June 20, 1997. The U.S. announces deactivation of its largest plutonium processing plant, the Plutonium Uranium Extraction Facility (PUREX) in Richland, Washington, a year ahead of schedule.

September 23, 1997. U.S. VP Gore and Russian PM Chernomyrdin sign an Agreement on Plutonium Production Reactors, in accordance with which any plutonium produced cannot be used for weapons purposes. They also agree that three remaining Russian plutonium production reactors at Seversk and Zheleznogorsk will be shut down by December 31, 2000. Russia, however, would prevent the entry into force of the agreement until alternative sources of energy for the surrounding communities are found.

1997. The Russian Defense Ministry submits a request for CTR assistance in eliminating 51 SS-N20 missile solid-fueled motors and components. Soon requests would follow for more assistance for the Strategic Offensive Arms Elimination (SOAE) projects that involved elimination and silo decommissioning of liquid-fueled missiles SS-18, SS-17 and SS-19, as well as solid-fueled SS-24s, SS-25s and SS-20-N missile systems.

1998

February 13, 1998. U.S. Secretary of Defense William Cohen and Russian Defense Minister Marshal Igor Sergeyev inaugurate Security Assessment and Training Center (SATC) at Sergiev Posad outside of Moscow built with CTR assistance. SATC's mission is to provide the Defense Ministry with a test-and-evaluation center for national nuclear security requirements.

March 4, 1998. President Yeltsin appoints Yevgeny Adamov, a nuclear physicist, to head Minatom after the retirement of Viktor Mikhailov. Adamov would remain in this position until 2001 and would go on to encounter a raft of legal problems.

March 31, 1998. Gore and Chernomyrdin announce a joint Nuclear Cities Initiative designed to promote the conversion of Russia's nuclear cities.

April 24, 1998. U.S. government announces the removal of about 5 kg of HEU from the former Soviet republic of Georgia in the so-called Operation Auburn Endeavor. The HEU, stored at the Nuclear Research Center in Tbilisi, is removed to safe storage in the UK and then to the U.S.

May 14, 1998. Ukrainian President Leonid Kuchma signs a decree on the elimination of Ukraine's 44 long-range strategic bombers and the ALCMs with which they're armed. This precipitates a CTR-funded project on the dismantlement of these aircraft and eventually additional non-strategic bombers and air-to-surface missiles. The project would end in December 2003.

June 1998. DoE and Russian State Customs Committee sign a protocol initiating a new program called the Second Line of Defense (SLD), with the goal of combatting illicit trafficking of nuclear and other radioactive material at some 350 Russian sea, air and land border crossings, by the end of 2011. By the end of 2006, the program would install radiation-detection equipment at more than 150 sea ports, airport and border crossings in Russia. The program is later renamed to Nuclear Smuggling Detection and Deterrence (NSDD) program and extended to other countries of the FSU, as well as to Africa, Asia and Europe.

June 5, 1998. The last of Ukraine's 130 SS-19 ICBMs is lifted from its silo, defueled and transported to a storage facility with CTR-funded equipment.

June 10, 1998. The United States first proposes amending the Convention on Physical Protection of Nuclear Materials (CPPNM); Russia later proposes a draft text that will eventually become the International Convention on the Suppression of Acts of Nuclear Terrorism (ICSANT, see 2005 below). Both conventions are key to securing vulnerable nuclear material and strengthening the global nuclear security architecture.

July 24, 1998. U.S. and Russian governments sign the Scientific and Technical Cooperation Agreement concerning the management of plutonium that has been withdrawn from military nuclear programs.

August 1998. Financial meltdown in Russia. U.S. responds by increasing the budget for the CTR program from $382 million in 1998 to $440 million in 1999 and $475.5 million in 2000. DoE's MPC&A budget goes from $137 million in 1998 to $152 million in 1999.

September 2, 1998. Presidents of U.S. and Russia sign the Joint Statement for Principles of Management and Disposition of Plutonium Designated as No

Longer Required for Defense Purposes. Each side declares approximately 50 metric tons of plutonium to be withdrawn from the weapons program and rendered unusable for nuclear weapons.

September 1998. The first of 46 SS-24 silos in Ukraine is eliminated using CTR funding. The last SS-24 silo would be decommissioned in 2001. The SS-24 missiles would be disassembled by 2002 at a special facility built with CTR funding at Pavlograd Mechanical Plant in eastern Ukraine.

November 1, 1998. DoD creates the Defense Threat Reduction Agency (DTRA) as a successor to the Defense Nuclear Agency (DNA).9 DTRA is responsible for nuclear stockpile stewardship and accountability to include surety inspections of military nuclear units to ensure they meet safe and readiness standards. It also becomes the point agency for implementing DoD CTR projects.

1998. DoE and Minatom begin joint project on the regulatory base for MPC&A.

1998. Official DoE-Minatom opening ceremony for the Methodological and Training Center for Nuclear Materials Accounting and Control (IPPE).

1998. Main phase of DoE-Minatom work to modernize MPC&A systems at NIKIET, Siberian Branch of NIKIET, Beloyarsk nuclear power plant and ITEP is completed.

1999

October 2, 1999. DoE and Minatom sign Agreement Regarding Cooperation in the Area of Nuclear Material Physical Protection, Control and Accounting (MPC&A). The agreement regulates MPC&A cooperation after the expiration of the original July 1992 SSD umbrella agreement. It provides for further development of MPC&A systems at nuclear enterprises in Russia and highlights the need to counteract illicit trafficking of nuclear materials.

2000

March 1, 2000. U.S. establishes National Nuclear Security Administration (NNSA), a separate semi-autonomous agency within DoE responsible for the management and security of U.S. nuclear weapons, nuclear nonproliferation and naval reactor programs. Some criticize the move as adding another bureaucratic layer that encumbers U.S.-Russian cooperative projects, such as lab-to-lab cooperation.

May 4, 2000. At a trilateral meeting, DoE Assistant Secretary Rose Gottemoeller, Minatom's Lev Ryabev and Kazakhstan's Minister of Energy, Industry and Trade Vladimir Shkolnik sign an agreement on remediation of the Semipalatinsk nuclear test site, including the disposition of plutonium, a byproduct of nuclear testing, left behind in underground shafts in several locations at the site. The project, dubbed Operation Groundhog, would remove 100 kg of weapons-grade plutonium from 26 areas of the test site, including, most famously, the Delegen mountain, and would be completed by August 2003. The U.S. would spend $200 million in CTR funds on this and other programs to secure nuclear materials and infrastructure at the Semipalatinsk site.

June 1, 2000. U.S. Secretary of Energy Bill Richardson and Minister Adamov sign the protocol extending the WSSX agreement and incorporating within the framework of the agreement cooperative activities related to nuclear warhead dismantlement, previously under the purview of the WD&FMT program. The WSSX agreement is extended for another five years. It would not be extended again.

September 1, 2000. The U.S. and Russia sign the Plutonium Management and Disposition Agreement (PMDA), which requires each country to dispose of at least 34 metric tons of weapons-grade plutonium. The PMDA would enter into force only on July 13, 2011, and Russia would unilaterally suspend its participation in the deal in October 2016 amid deteriorating bilateral relations.

2001

March 2001. Alexander Rumyantsev, an engineer and a former director of the Kurchatov Institute in Moscow, is appointed the head of Minatom. Rumyantsev becomes the first Minatom outsider to hold this post. His institute has been supportive of cooperative projects with the U.S.

March 2001. Within the framework of WSSX and with the support of the Russian Defense Ministry's 12th GUMO and DoD's DTRA, U.S. nuclear lab SNL and Russian nuclear lab VNIIA launch the Safety and Security Technology for Russian Warheads program, or TOBOS.10 The goal of the TOBOS program is to develop a system that provides round-the-clock security and location information on warhead containers in Russia. The program is terminated in 2007 due to a decline in U.S.-Russian relations.

September 2001. USEC achieves a milestone of purchasing a quantity of Russian LEU equivalent to 5,000 warheads-worth of HEU.

October 2001. DoD and Uzbekistan's Defense Ministry sign a CTR agreement to spend up to $6 million to prevent the spread of biological weapons, materials and technology.

December 2001. Funding responsibility for the project to Eliminate Weapons-Grade Plutonium Production is transferred from DoD to DoE. The departments of Health, Agriculture, Treasury and Commerce, the EPA, Customs and Coast Guard are enlisted to support CTR projects.

2002

April 2002. All new CTR projects in Russia are suspended, as President George W. Bush could not certify before Congress that Russia was in compliance with the existing agreements.

May 24, 2002. President Bush and President Putin sign a Treaty on Strategic Offensive Reductions (SORT) in Washington, D.C., providing for the reduction of each country's nuclear arsenal to between 1,700 and 2,200 warheads. After ratification by Congress and the State Duma, the treaty would enter into force on June 1, 2003.

June 27, 2002. During a summit at Kananaskis in Alberta, Canada, the G8 issues a statement outlining the Global Partnership Against the Spread of Weapons and Materials of Mass Destruction. The Global Partnership commits $20 billion—$10 billion from the U.S. and $10 billion from the other G7 nations—over a period of 10 years to fund nonproliferation projects and assist Russia and other nations in addressing nonproliferation, disarmament, counter-terrorism and other nuclear safety issues.

July 2002. The U.S. and Kazakhstan renew the CTR umbrella agreement that had lapsed at the end of 2000.

August 20, 2002. Ukraine officially disbands the 43rd Rocket Army that formerly commanded units associated with the 176 ICBMs inherited by Ukraine.

December 22, 2002. The U.S., Russia, the IAEA and Serbia complete a four-week joint operation to repatriate some 50 kg of HEU, as well as 2.4 tons of highly radioactive spent fuel, from a research reactor at the Vinca Institute of Nuclear Sciences in Serbia.

2003

FY2003. DoE and NNSA launch the Megaports Initiative that seeks to equip 100 of the world's busiest ports with enhanced capabilities to detect nuclear and other radioactive materials.

March 2003. DoD's CTR policy office commences a six-month review of every program and project to ascertain whether it addresses the administration's focus on terrorist threats. This leads to a scaling down of some CTR projects in the FSU and the emergence of two new programs: Biological Weapons Proliferation Prevention and Weapons of Mass Destruction Proliferation Prevention Initiative.

April 2003. The dismantlement of the Stepanogorsk biological weapons facility in Kazakhstan, carried out with CTR funds, is completed.

May 9, 2003. Congress adopts Sen. Lugar's Nunn-Lugar Expansion Act, which authorizes operators outside the former Soviet Union to address proliferation threats. CTR funds are committed for the first time outside of the FSU to destroy chemical weapons in Albania.

May 21, 2003. The governments of the U.S., Belgium, Denmark, Finland, France, Germany, the Netherlands, Norway, Sweden, the UK and Russia, as well as the EU and IAEA, sign a framework agreement on a Multilateral Nuclear Environmental Program in the Russian Federation (MNEPR). The agreement aims to provide assistance to Russia in the area of safety of spent nuclear fuel and radioactive waste.

September 2-4, 2003. VNIIEF and Minatom conduct a Sarov-2003 exercise that tests the entire upgraded MPC&A system. The exercise involves transporting nuclear materials by rail and vehicle guarded by Interior Ministry troops. The test is attended by a group of U.S. observers from DoE and the labs.

2004

March 9, 2004. The Russian government reorganizes Minatom into the Federal Agency on Atomic Energy, or Rosatom. Rumyantsev remains in charge.

May 26, 2004. Secretary of Energy Spencer Abrahams announces the Global Threat Reduction Initiative (GTRI) with the mission to identify, secure and recover high-risk vulnerable nuclear and other radiological materials around the world.

May 2004. Russia joins the Proliferation Security Initiative.

May 2004. DoE issues interim Guidelines for Sustaining Effective Operation of Material Protection, Control and Accounting Systems in the Russian Federation, or Sustainability Guidelines for short.

2004. DoE-Minatom work begins on MPC&A Operations Monitoring System project.

2004. Main phase of DoE-Minatom work to modernize MPC&A systems at the Novosibirsk Chemical Concentrates Plant is completed.

2005

February 24, 2005. At their summit in Bratislava, presidents Bush and Putin issue the Joint Statement on Cooperation on Nuclear Security. What becomes known as the Bratislava Initiative sets a 2008 deadline for completing physical security upgrades in Russia, including at 97 nuclear material and warhead sites. They also issue a joint statement on cooperation to prevent nuclear terrorism. This greatly increases the pace and scope of nuclear security work in Russia.

April 13, 2005. U.N. General Assembly adopts the International Convention for the Suppression of Acts of Nuclear Terrorism (ICSANT), the initial draft for which was presented by Russia in 1998. The convention is designed to criminalize nuclear terrorism and to foster law-enforcement cooperation against potential nuclear terrorists. It has been signed by 115 countries—74 of which, including Russia and the United States, have ratified it—and acceded to by 33 more.

May 4, 2005. Former Rosatom chief Adamov is arrested in Switzerland on charges brought by the U.S. accusing him of diverting $9 million from one of the DoE's nuclear security projects. Adamov is later extradited to Russia, where he is convicted of fraud and sentenced to five and a half years in prison—a sentence that would later be suspended.

June 2005. Rosatom and DoE sign the framework for continuing cooperation on MPC&A for the period 2005-2012. The scope of cooperation, however, is substantially reduced from the previous decade.

November 15, 2005. Sergei Kiriyenko is appointed to head Rosatom. Kiriyenko, who comes from an engineering and finance background and briefly served as prime minister in 1998, becomes the first person in this position without prior nuclear-related experience.

2006

April 19, 2006. As part of the NNSA-funded GTRI, some 60 kg of spent research reactor fuel is removed from Uzbekistan to Russia, the first such repatriation of spent fuel since the break-up of the Soviet Union.

June 16, 2006. The U.S. and Russia sign a new CTR implementing agreement on security enhancements and training at Russian nuclear storage sites.

July 1, 2006. The fissile-materials storage facility at Mayak, built with the help of CTR funds, begins accepting weapons-grade material.

July 15, 2006. The U.S. and Russia launch a Global Initiative to Combat Nuclear Terrorism.

August 9, 2006. NNSA and IAEA remove close to 40 kg of HEU from a research reactor near Warsaw, Poland, and transfer it to Russia.

October 24, 2006. DoE announces completion of security enhancements at all 50 Russian navy nuclear locations, both warhead and nuclear material sites.

October 30-31, 2006. The first meeting of the Global Initiative to Combat Nuclear Terrorism takes place in Rabat, Morocco, attended by representatives of 13 governments. The meeting adopts a statement of principles that include commitment to strengthening the global security architecture to prevent, detect and respond to the threat of nuclear terrorism.

2007

2007. Congress eliminates the certification requirements for CTR. For many previous years, Congress had conditioned funding for the Cooperative Threat Reduction Program on the president making an annual certification that each recipient nation was committed to certain goals.

August 2, 2007. Ground is broken for construction of the Mixed Oxide (MOX) Fuel Fabrication Facility at Savannah River National Laboratory, in Aiken, South Carolina, intended to enable the elimination of 34 metric tons of U.S. weapons grade plutonium. The DoE would later add an additional 9 metric tons of excess fissile material to the total. The facility would be plagued by problems and is still not complete as of this writing.

December 1, 2007. President Putin signs into law a bill transforming Rosatom from a government agency into the Russian State Atomic Energy Corporation. It continues to oversee all nuclear fuel cycle activities, both civilian and military.

2008

April 9, 2008. Sen. Lugar announces the elimination of the last of the 56 SS-24 ICBMs in Russia under the Strategic Offensive Arms Elimination (SOAE) program.

April 20, 2008. The first plutonium-producing reactor, ADE-4, at Seversk in Russia is shut down as part of the joint NNSA-Rosatom program. As part of the project, the U.S. constructed a coal-fired plant to provide electricity and steam heat to the surrounding community.

June 5, 2008. The second reactor at Seversk, ADE-5, is shut down, leaving only one more plutonium-producing reactor in Russia at Zheleznogorsk.

November 12, 2008. The NNSA announces the completion of security upgrades at Mayak ahead of the December 2008 deadline. The upgrades are part the ongoing MPC&A assistance to Russia, accelerated by the Bush-Putin Bratislava Initiative of February 2005.

2009

March 21, 2009. The Treaty on a Central Asian Nuclear Weapons Free Zone (CANWFZ), established by Kazakhstan, Kyrgyzstan, Tajikistan, Turkmenistan and Uzbekistan, enters into force.

May 29, 2009. A CTR-funded Chemical Weapons Destruction Facility opens in Schuchye, Russia.

2010

April 12-13, 2010. The U.S. hosts the first Nuclear Security Summit, which brings together leaders of 47 countries and three international organizations to advance global cooperation on nuclear security and combatting nuclear terrorism. The summit concludes with a joint communique by all the leaders to secure all nuclear materials in four years. The U.S., Russia, Ukraine and many other countries also make specific national commitments at the summit to strengthen nuclear security.

April 13, 2010. At the summit, Russian President Dmitry Medvedev announces the closure of Russia's last reactor producing weapons-grade plutonium, the ADE-2 at Zheleznogorsk, after 52 years of operation. The closure is a culmination of U.S.-Russian cooperation on deactivating plutonium-producing reactors that started in 1997. Since 1993, the Zheleznogorsk reactor was producing electricity for the surrounding communities, yet still generating weapons-grade plutonium as a byproduct.

April 13, 2010. On the sidelines of the summit, the U.S. and Russia sign a protocol to amend the 2000 Plutonium Management and Disposition Agreement, under which both countries would dispose of approximately 17,000 nuclear weapons' worth of excess weapon-grade plutonium.

May 11, 2010. President Barack Obama resubmits the U.S.-Russia Agreement for Peaceful Nuclear Cooperation, also known as the 123 Agreement, to Congress. The agreement was initially submitted to Congress by the Bush administration in 2008 but withdrawn after the Russian-Georgian war in August of that year.

June 10, 2010. DoE Secretary Steven Chu and deputy director of Rosatom Ivan Kamenskikh dedicate the MPC&A Training Center at VNIIEF. The center is established for the professional development, retraining and skill enhancement of personnel involved in operating the MPC&A systems.

October 12, 2010. The NNSA announces the completion of the return to Russia of 450 kg of spent HEU fuel from Poland's Ewa and Maria research reactors in Swierk. This is the single largest removal of HEU in the history of the GTRI. The U.S. also provides Poland with assistance in conversion of the Maria reactor from HEU to LEU fuel.

November 2010. The U.S. and Kazakhstan complete the transfer of weapons-grade nuclear materials stored in the Central Asian republic.

December 1, 2010. Russia announces that it has created the world's first international nuclear fuel bank in Angarsk to operate under the auspices of the IAEA.

2011

January 2011. The U.S. and Russia exchange notes to bring into force the 123 Agreement.

April 26, 2011. The UN Security Council gives a 10-year extension to Resolution 1540, its main legal instrument to prevent nuclear, chemical and biological weapons from falling into the hands of terrorist groups.

March 2011. Rosatom's Kiriyenko visits the U.S. to oversee the extension of a nuclear security program, the signing of a deal to supply uranium to the U.S. and to explore exchanges of nuclear technologies.

May 2011. The State Duma ratifies the U.S.-Russian plutonium disposition protocol signed by U.S. Secretary of State Hillary Clinton and Russian Foreign Minister Sergei Lavrov in April 2010. The protocol calls for both sides to dispose of 34 tons of plutonium each.

May 2011. G8 leaders extend the mandate of the Global Partnership Against the Spread of Weapons and Materials of Mass Destruction at their summit in Deauville, France. They make no financial commitments.

May 2011. The NNSA and the Federal Environmental, Industrial and Nuclear Supervision Service of Russia (Rostekhnadzor) sign an agreement to extend nuclear security cooperation for an additional seven years.

June 9, 2011. Secretary Chu signs an agreement with Rosatom's Kiriyenko to provide support for national and international efforts on nonproliferation of nuclear weapons, advancing research efforts and the development of a legal framework to expand joint activities between the two countries on nuclear research.

July 13, 2011. Secretary Clinton and Minister Lavrov exchange diplomatic notes in Washington, D.C., thus finally bringing the amended PMDA into force.

July 2011. The Russian government, in a diplomatic note, informs the U.S. and other states that it withdraws from the ITSC agreement. Since its opening in 1994, the ITSC has disbursed over $1 billion for research projects involving more than 30,000 scientists with dual-use skills in the FSU.

September 22, 2011. The NNSA and the Federal Customs Service of Russia announce the completion of joint work on equipping 383 Russian border crossing points with equipment designed to detect nuclear and radiological smuggling as part of the NNSA's Second Line of Defense Program.

2012

March 26-27, 2012. Heads of 52 states attend the second Nuclear Security Summit in Seoul, South Korea. At the summit, the Russian leadership makes a number of proposals, including an initiative to organize a workshop on nuclear security.

March 27, 2012. DoS announces the removal of 128 kg of HEU from two sites in Ukraine. This is the last of three shipments that removed of a total of 234 kg of HEU from Ukraine to Russia over a two-year period.

May 2012. Russia and Uzbekistan sign an intergovernmental agreement that will allow Russia to take back spent HEU fuel from Uzbekistan's research reactors.

October 9, 2012. Russia announces that it has notified the United States that it no longer wants to extend the CTR umbrella agreement due to expire in June 2013.

November 2012. The NNSA announces the removal of 72.8 kg of spent HEU fuel from the Institute of Nuclear Physics in Tashkent, Uzbekistan, to Russia.

2013

April 5, 2013. The NNSA announces the removal of the Czech Republic's last remaining HEU, some 68 kg, from the Nuclear Research Institute in Rez to Russia.

July 2, 2013. The U.S. and Russia announce the successful removal of 11 kg of HEU from Vietnam's Dalat Nuclear Research Institute.

June 14, 2013. CTR umbrella agreement expires. U.S. and Russia sign a protocol to the 2003 MNEPR framework agreement to govern nuclear security cooperation, albeit much narrower in scope.

September 16, 2013. U.S. Secretary of Energy Ernest Moniz and Rosatom's Kiriyenko sign in Vienna an Agreement on Cooperation in Nuclear- and Energy-Related Scientific Research and Development, which provides the legal framework necessary to expand cooperation between U.S. and Russian nuclear research laboratories, institutes and facilities in a broad range of areas, including nuclear technology, nonproliferation, fundamental and applied science, energy and environment.

November 2013. Deputy Assistant Secretary of State Frank Rose announces that the down-blending of HEU to LEU by Russia that was required by the 1993 U.S.-Russia HEU Purchase Agreement has been completed.

November 7, 2013. The NNSA and its Russian partners announce they have successfully completed the removal of 14 Russian radioisotope thermoelectric generators (RTGs) from the Northern Sea Route.

November 5, 2013. The U.S., Russia and the IAEA announce that they have completed removal of all remaining HEU from Hungary.

December 10, 2013. The last shipment of LEU from Russia's port of St. Petersburg arrives at the port of Baltimore in completion of the HEU Disposition Agreement, or Megatons to Megawatts program. Over the course of the 20 years since the program began, Russia blended down 500 metric tons of HEU, the equivalent of some 20,000 nuclear weapons, into more than 14,000 metric tons of LEU. The overall cost of LEU purchases by the U.S. reached $8 billion.

2014

March 28, 2014. U.S. government announces suspension of projects under the U.S.-Russia Bilateral Presidential Commission, established in 2009 as part of President Obama's "reset" policy with Moscow, over what Western governments and Ukraine describe as Russia's annexation of Crimea and support of armed insurgency in eastern Ukraine. The suspension includes the commission's working groups on nuclear energy and nuclear security and scientific cooperation. However, nuclear security cooperation on existing projects between DoE/NNSA and Rosatom continues.

March 24-25, 2014. The third Nuclear Security Summit takes place in The Hague. The U.S. and Russia set aside their differences over Crimea to endorse the final statement that calls for enhancing nuclear security. But while signing the final communiqué Russia, China and 16 other countries shun a separate initiative of the U.S., the Netherlands and South Korea to incorporate UN nuclear agency security guidelines into national rules.

September 22, 2014. The U.S. announces it has worked with Russia to help remove 50 kg of highly enriched uranium from Poland.

September 29, 2014. Kazakhstan removes a stockpile of Russian-origin HEU fuel from the WWR-K research reactor in Almaty to Russia.

November 5, 2014. U.S. DoS announces that it received in mid-October a Russian Foreign Ministry demarche stating that Moscow will not participate in the 2016 Nuclear Security Summit.

December 16, 2014. Russia terminates the MNEPR Protocol and ceases cooperation with the U.S. at most Russian weapons complexes and civilian nuclear sites.

2015

August 27, 2015. The government of Kazakhstan and the IAEA sign an agreement that establishes the international nuclear fuel bank at the Ulba Metallurgy Plant located in the city of Ust-Kamenogorsk in eastern Kazakhstan.

August 31, 2015. Vladimir Mikerin, president of the U.S. subsidiary of TENEX, a division of Rosatom, and the sole Russian executor of the U.S.-Russian HEU deal, pleads guilty before the district court in Maryland to receiving over $2 million in corrupt payments meant to influence the awarding of contracts with Rosatom to U.S. companies. At least two other individuals are convicted of participating in this corrupt scheme.

September 28, 2015. Russia's Rosatom formally launches a commercial mixed-oxide (MOX) fuel fabrication facility at the Mining and Chemical Combine (MCC) in Zheleznogorsk to comply with the plutonium disposition deal signed by the U.S. and Russia.

September 29, 2015. The NNSA announces that the final 5 kg of HEU has been removed from Uzbekistan's IIN-3M Foton research reactor to Russia.

December 22, 2015. IAEA announces that some 1.83 kg of HEU has been removed from the former Soviet republic of Georgia.

2016

March 31-April 1, 2016. Fourth and final Nuclear Security Summit takes place in Washington, D.C., without Russian participation.

September 26, 2016. Secretary Moniz announces that the NNSA in cooperation with Poland, Russia and IAEA has successfully repatriated 61kg of HEU spent fuel from Maria research reactor in Poland.

October 3, 2016. President Putin issues a decree suspending the U.S.-Russian Plutonium Management and Disposition Agreement and related cooperation, citing unfriendly U.S. policy toward Russia as one of the reasons. The State Duma later confirms the move by passing a law.

October 5, 2016. The Russian government suspends the 2013 U.S.-Russian Agreement on Nuclear Energy Research and Development. It also terminates the 2010 agreement between Rosatom and DoE on cooperation in the conversion of six Russian research reactors to low-enriched uranium fuel.

Footnotes

The IAEA considers 25 kg of HEU and 8 kg of plutonium as sufficient to build a single nuclear weapon.

Alma-Ata would be renamed Almaty in 1993.

VNIITF stands for Vserossiisky nauchno-issledovatel'sky institut tekhnicheskoi fiziki, or the All-Russian Scientific Research Institute of Technical Physics. VNIIEF stands for Vserossiisky nauchno-issledovatel'sky institut experimental'noi fiziki, or the All-Russian Scientific Research Institute of Experimental Physics. Soviet nuclear facilities included some 10 closed secret cities that were known internally only by their postal indexes. These would not appear on maps until 1992 and most retain a semi-closed status.

PDD-3 remains classified but some reference to it can be found in PDD-30.

VNIIA stands for Vserossiisky nauchko-issledovatel'sky insitut avtomatiki, or the All-Russian Scientific Research Institute of Automatics.

NIIAR stands for Nauchno-issledovatel'skiy institut atomnykh reaktorov, or Scientific Research Institute of Atomic Reactors. NPO stand for nauchno-proizvodstvennoe obyedinenie, or scientific production association.

GAN stands for Gosudarstvenny atomny nadzor, or State Atomic Safety Authority.

Excerpt from Graham Allison's testimony on loose nuclear material from the former Soviet Union. Given before the Senate Subcommittee on European Affairs, August 1995.

DNA was briefly renamed Defense Special Weapons Agency (DSWA) before becoming DTRA in 1998.

TOBOS stands for Tekhnologii obespecheniya bezopasnosti opasnykh sistem, or Technologies for Securing the Safety of Dangerous Systems. GUMO stands for Glavnoe upravlenie Ministerstva oborony, or Main Directorate of the Defense Ministry; the 12th Main Directorate was roughly a counterpart to DTRA.

Founded 1945

Headquarters Northern Virginia

Services Government research and development

Parent Westinghouse Air Brake

American Standard

Raytheon

Melpar was an American government contractor in the 20th century Cold War period. At a time when most employment in Washington, DC was directly by the US federal government, Melpar became an early private sector contracting company training a high technology workforce in the area.

History

In 1945, after the conclusion of World War II, the founders of Melpar Inc (Thomas Meloy and Joseph Parks), at the suggestion of the United States Navy, moved from New York City to the Washington, DC area to obtain government contracts.[1] Meloy had served as an assistant to Henry Stimson during the war. The company name was derived from the first syllable of their last names.[2] In late 1945 Parks accidentally killed himself in a hunting accident; nevertheless Meloy continued promote developing Melpar as an engineering and production company doing business with the Armed forces. He acquired the Carl Miller Engineering Company, a small firm that designed and produced electro-mechanical products. The new company took over a contract for airborne radar systems, and expanded. In the next few years Melpar moved to Alexandria, Virginia, added a second plant in Cambridge, Massachusetts, and a third plant in Alexandria. Within 15 years the company grew to more than 6,000 employees, and occupied ten facilities of more than 1,000,000 square feet (93,000 m^2) throughout Northern Virginia.

Events such as the Berlin Airlift, the detonation of the nuclear weapons by the Soviet Union, and the outbreak of the Korean War helped Melpar's business. In addition to military applications, technology began to play a role in nonmilitary areas. The US government had a pool of technical talent in its laboratories, and assumed an expanded role. The launch of Sputnik in 1957 further intensified competition with the Soviet Union.

Melpar embraced rather than shunned government work, as did most other companies. In 1951 Westinghouse Air Brake Company, a railway equipment producer founded in 1869, purchased the company for $1 million. It was a large sum for the time, despite typical profits on government contracts of only 1-2% of sales, which were generally reinvested in research.

The 1990s saw the development of the Internet, and its emphasis on computer science, information systems, and software technology. During the 1970s and 1980s a similar fervor was experienced in the telecommunications and biotechnology sectors. However, during the 1950s and 1960s the most exciting technical place to advance the knowledge was the fledgling aerospace and electronics industry. The 1950-60's had many new firms and people readily working long hours. A unique feature of the 1950s, however, was that the US government, not the commercial marketplace, was the prime source of funding of new technologies.

Melpar was located near its customers in Washington, DC. Other government contractors such as Atlantic Research, Vitro Laboratories, Page Communications Engineers, Hazleton Laboratories, COMSAT and the Applied Physics Laboratory also benefited. However, Melpar was the largest. In 1963, openings included astronomers, astrophysicists, microbiologists, entomologists, geophysicists and gas chromatagraphers. Melpar filled a void due to the lack of a technical university in the area (Melpar welcomed George Mason University in 1964).[3]

In 1952 Melpar built an expensive, modern plant 10 miles (16 km) from downtown on a 44-acre (180,000 m^2) wooded tract near Seven Corners on Route 50. The new building, surrounded by fields in a campus-like setting 400 feet (120 m) back from the road, had a pond, willow trees, brick facade, and parking behind the plant. It was a contrast to the small buildings and warehouses located downtown, and was promoted as harmonizing industrial design with residential surroundings. To accommodate Melpar, Fairfax County revamped its zoning laws to help relieve the tax burden on property owners. Melpar employees could work near their homes. In development advertising the state of Virginia touted Melpar as a model.[citation needed] The decision to move to the country was made more than ten years before the "circumferential highway" was completed, and more than 15 years before a shopping mall now known as Tysons Corner Center was built at Tyson's Corner. Later known as the Capital Beltway, this highway led to the term beltway bandits for the contracting firms that later proliferated.[2]

Melpar linked production facilities to its scientific and engineering capabilities. The company won two large contracts for B-58 aircraft electronics and Minuteman missile guidance components, requiring a buildup of manufacturing plants and an associated technical work force in the Washington area. These facilities enabled scientists to test their laboratory research with prototype hardware. By 1960 the company assembled products such as missile equipment, flight simulators, radar beacons, fuses, data processing equipment, communications, antennas, electronic countermeasure and reconnaissance systems.

Managing manufacturing programs presented a different set of challenges. Since Washington did not have a workforce of electronic technicians Melpar had to build and train one. The Minuteman production line required 1,800 people and as many as 130 were hired in a single day. Technology schools such as the Capitol Radio Engineering Institute expanded to help train designers and draftsmen to build products for space and missile programs. Universities conducted technical courses in Melpar's facilities for employees on their own time, in programs praised by the Secretary of Education. Melpar instituted tuition-reimbursement policies with incentives for high grades in technical courses. Positions for minorities and females opened at unprecedented levels. [citation needed]

During this time the company also pioneered manufacturing technology. Unlike today when existing commercial off-the-shelf technology is available, manufacturing had to translate ideas quickly into producible reality. Intense development occurred in areas of microelectronics technology such as fabrication and layout of miniature circuits, and use of thin film devices and plastic components. Processes such as welding, plating, soldering and automatic component insertion were studied and improved. Melpar's manufacturing engineers often found themselves writing engineering process documents that eventually became the government standard.

Melpar performed diverse research in physical and life sciences over 40 years. One project begun in the late 1950s (foreshadowing artificial intelligence) linked biology and the design of electrical devices–computer programs that emulated artificial nerve cells and simulated functions such as learning ability and initiative. The intent was to construct a thinking machine, similar to a human nervous system that learned pattern recognition and avoided mistakes (e.g. programming a mobile satellite on the moon to avoid a deep precipice). Studies on the nature of speech led to more efficient use of the radio spectrum through bandwidth compression, and improved long distance and coded communications–other related studies focused on elimination of speech deficiencies and development of a phonetic typewriter. In medical research Melpar developed synthetic materials (tissue growth) to be compatible with the heart (later known as the Jarvik heart), and produced an electronic heart monitor (Cardiac Sentry) which detected out-of-norm variations, maintained hospital records and administered prescribed treatments. The company was a pioneer in plasma physics and developed materials for communicating with manned space vehicles reentering the atmosphere. Using solar energy, desalinization experiments were conducted to make saline and brackish water drinkable. Detection systems to measure highway curves, motions and vibrations were developed to improvemass transit systems.

Melpar performed studies in cell biology, food chemistry, composite materials (light weight, high temperature), solar energy, meteorology, virology and immunology (cancer research), air and water pollution, air traffic control, global navigation (constructed a prototype map of the Global Positioning System), and underwater acoustics and optics. They studied methane detection in mines and conversion of coal to acetylene as a new source of energy. An antenna was placed on top of the Empire State Building to evaluate the feasibility of UHF broadcasting. Offshoot products from laboratory technology included resins, varnishes, foam, nonsmudge ink, adhesives, photoelectric readers and frequency standard instrumentation. Synthetic diamonds and emeralds were produced to test hardness in space age materials. While most of Melpar's efforts were technical, some involved the social sciences–creation of a stock index of S&P 500 companies for Business Week, and operation of a Job Corps center.

Melpar continued its work on military and space applications such as radar, communications, and electronic counter measure systems as well as airborne and ground intelligence systems. Devices to detect lethal chemical and biological agents were developed. The company participated in early unmanned (Vanguard and Explorer) and manned space programs (Mercury and Apollo), providing antennas and semidried food for lunar missions. A quarantine facility was produced to insure the astronauts had not brought any contamination from the moon.

Melpar also produced more than a dozen flight simulators, including many of the Air Force's century series fighters and helicopter systems for the Navy. These simulators enabled more realistic and demanding training, saving pilots' lives and reducing fuel consumption during the 1970s energy crisis.

A company newspaper editorial in 1957 stated, "We have sought the breeder job, the line of inquiry promising to expand a general field of engineering endeavor or open a new one."[citation needed]

However, in the mid-1960s Melpar's research, engineering and production began to decline. The government's budget priorities changed, with emphasis

placed on solving the nation's social problems.The human spaceflight program had few follow-on missions after landing a man on the moon. The military's budget was heavily dedicated to the Vietnam War. These budget trends reduced Melpar's programs.

Other factors contributed to the business decline. The government did not award follow-on manufacturing contracts, so layoffs of production workers took place. The American Standard Companies, bought the Westinghouse Air Brake Company, and immediately began to sell off the assets. Melpar's research programs were diverse, unprofitable, and had uncertain business prospects.

Some unfavorable publicity contributed to Melpar's misfortunes. In 1963 Bobby Baker was Secretary for the Majority Democratic caucus in the US Senate, and closely linked to Lyndon B. Johnson - he held perhaps the most powerful nonelected position in Congress. A Melpar vending machine contractor filed a lawsuit against Baker, accusing him of influence peddling to switch the contract to a competitor, with which he had financial ties. Within a few days Baker resigned his position. For almost two years there were headlines and congressional investigations into Baker's business deals and questionable relationships. Melpar's top management was called to testify before the Senate Rules committee, although ultimately the Melpar incident was settled out of court. Even so, the situation demoralized employees, did not enhance the company's ability to win new Government contracts, and changes in company management soon took place.

An investigation was also ordered into overpricing of the B-58 systems.[4]

Some employees left Melpar to start new companies (usually in the Washington area). Over the next 20 to 30 years more than a dozen spin-offs generated millions of dollars in annual sales and employed thousands in the Washington area. One employee began a communications company in Florida that ultimately became the Harris Corporation. Two employees from a research division near Boston formed the data communications manufacturer Codex Corporation in 1962.[5] . Many prospered in the 1970s and 1980s, but then left the area, due to industrial consolidations, mergers, and acquisitions. Meloy Laboratories continued Melpar's biotechnical, pharmaceutical research until Rhône-Poulenc moved the operation to Philadelphia in the 1980s. A flight simulator spin-off named Simulation Engineering Corporation (Secor), went through four changes in ownership in Northern Virginia–from Sperry Rand to Honeywell to Hughes to Raytheon - before being moved to Texas in 1998. The same employees started a second company, Quintron, which was purchased by Loral for $22 million and later owned by Lockheed. A few companies still reside in Northern Virginia –VSE Inc in Alexandria (1300 employees), RSI Inc in Sterling (500 employees), ISOMET in Springfield, ST Research (now a division of Boeing called Argon ST[6]) in Newington, as well as half a dozen small machine shops.[*citation needed*]

For almost 50 years Melpar used the same facility on U.S. Route 50 in Virginia and had about 1,500 employees. The company went through several changes in ownership, being purchased by LTV Electrosystems in 1970 (changed to E-Systems in 1972) and the Raytheon Company in 1995. The name Melpar was discontinued in 1994 and the facility served as headquarters for Raytheon's Strategic Systems Division. Over the last 25 to 30 years the company performed some government electronics contracts, such as production and support of ground systems for the U-2 reconnaissance aircraft, and unmanned aerial vehicles. Additionally this facility managed information systems for agencies such as the US Department of Education, and fabricated and tested electronic products. In 2010 Raytheon moved out of the building at 7700 Arlington Boulevard, and it was remodeled for Tricare.[7][8]

[HC003T][GDrive]

Pages 105 - 106 : International Relationships

Since World War II, American military operations research organizations had cooperated closely with their counterparts in Britain and Canada. ORO personnel worked closely with British and Canadian operations analysts in Korea, and the offi ce maintained a full-time liaison offi cer with the British Army Operational Research Establishment (AORE).184 Another important means of maintaining contact with the British and Canadian OR organizations was the series of annual Tripartite (later Quadripartite, with the addition of the Australians) Conferences on Army Operations Research, the fi rst of which was held in London in April 1949 and the second of which was hosted by ORO in Washington in October 1950.185 Each conference concentrated on a specifi c major topic and was attended by representatives from ORO, AORE, and the Canadian Army Operational Research Establishment (CAORE), as well as representatives from the OR organizations of the other services in all three countries. Th e British and Canadians also frequently participated in conferences sponsored by other U.S. Army agencies, such as the annual Army OR symposium sponsored by the Ordnance Corps Army Research Offi ce (Durham). At the second such symposium in March 1962, G. Neville Gadsby of AORE explained that his organization included a small element with the director of operational science and research in the War Offi ce and the main AORE, located at West Byfl eet a few miles outside London, which included an integrated staff of military and civilian analysts divided into subelements covering weapons, tactics, fi eld studies, general studies (logistics, economics, communications,

and so forth), human factors, and clothing and equipment physiology.186 As Gadsby explained, AORE was on a level with two other British Army OR groups, one in Germany (Operational Research Section, British Army of the Rhine) and one in southeast Asia (Operational Research Unit, Far East). At the same symposium, Henry H. Watson discussed the CAORE, which then was physically located at Canadian Army Headquarters in Ottawa and reported directly to the scientifi c advisor to the chief of the General Staff .187 Watson also explained that the entire staff of CAORE, which included military personnel, was in Ottawa and that CAORE conducted a program of research projects (10–15 percent of which were self generated) that fell into two main groups: tactical studies and systems studies.188

In the 1950s, the other nations of the North Atlantic Treaty Organization (NATO) also began to set up OR organizations, as did NATO itself.189 In the mid-1950s, an international OR group composed primarily of the British and the Canadians was established under Headquarters, Allied Air Forces Central Europe, at Fontainebleau, France, and a group led by Dr. H. F. Robertson was organized at Supreme Headquarters Allied Powers Europe (SHAPE).190 From 1953 the NATO Advisory Group on Aeronautical Research and Development (AGARD) (and later the OR group at SHAPE) was active in promoting lectures on operations research and helping interested nations form their own OR groups.191 Robertson's team at SHAPE also organized a number of conferences on OR in the various NATO member nations. Th e fi rst conference, in 1955, had 30 participants from only four nations, but the third gathering, held in November 1956, had 120 participants representing all but two of the NATO countries.192 In April 1957, the fourday NATO conference on operational research sponsored by AGARD was held at the Palais de Chaillot in Paris.193 Th e chief aims of the conference were to interest high-level NATO administrators in the need for OR and to familiarize NATO technical and operating personnel with the latest research methods.194 As the supreme allied commander in Europe, U.S. Air Force General Lauris Norstad, told attendees at the conference:

Operational research, by revealing methods for more eff ective utilization of our manpower, our skills, our material and our resources, is making a signifi cant contribution to the military potential of the Atlantic Alliance. Th is is of utmost importance, for our strength depends not alone on what we have but to a large extent on what we do with what we have.195

Th e attendees at the second SHAPE operations research conference, held at HQ SHAPE on 14–15 February 1956, noted that most NATO OR groups were in the central geographical area, with few in the NATO “fl ank” countries.196 In March 1956 AGARD organized a threeman team—Th ornton Page (from the ORO fi eld offi ce in Heidelberg), Tony Sargeaunt (from the SHAPE scientifi c advisory staff), and Glen D. Camp (from Melpar, Inc.)—to conduct a two-week trip to Italy, Greece, and Turkey to promote OR and help organize OR groups.197 Th e Italian General Staff expressed interest and asked for a followup visit, and, on 1 June 1956, the Turks established an OR group within the Turkish General Staff Scientifi c Advisory Board comprising ten reserve offi cers with mathematics and scientifi c training under the direction of Turkish Air Force Col. Fuat Ulug.198

As of 1956, allied OR groups in NATO included those at the headquarters of the British Army of the Rhine, the Second Allied Tactical Air Force, and the Canadian Infantry Brigade Group (all near Dusseldorf); a RAND representative and elements of the Offi ce of Operations Analysis at Headquarters, United States Air Forces Europe, in Wiesbaden; the ORO fi eld offi ce at Headquarters, United States Army Europe; Headquarters, Twelfth U.S. Air Force at Ramstein; Headquarters Allied Air Forces Central Europe at Fontainebleau; two Navy analysts at Headquarters, Commander SOUTH near Naples; the Air Defense Technical Center in Th e Hague; SHAPE near Paris; and the Turkish OR group under Col. Ulug.199 By 1963, Norway had an OR group of approximately 450 people concentrated in the Norwegian Defence Research Establishment (NDRE).200 By that time, operations research in NATO was focused in the SHAPE Air Defence Technical Center (SADTC), roughly 40 percent of whose scientifi c staff (thirty-fi ve analysts) were assigned to OR tasks.201 Th e SADTC analysts generated 70–80 percent of their own projects, and, as with the NDRE, military offi - cers were seconded to participate in specifi c projects.202

Toxicologic Assessment of the Army's Zinc Cadmium Sulfide Dispersion Tests

Subcommittee on Zinc Cadmium Sulfide, Commission on Life Sciences, Division on Earth and Life Studies, National Research Council

National Academies Press, Jun 13, 1997 - Political Science - 351 pages

During the 1950s and 1960s, the U.S. Army conducted atmospheric dispersion tests in many American cities using fluorescent particles of zinc cadmium sulfide (ZnCdS) to develop and verify meteorological models to estimate the dispersal of aerosols. Upon learning of the tests, many citizens and some public health officials in the affected cities raised concerns about the health consequences of the tests. This book assesses the public health effects of the Army's tests, including the toxicity of ZnCdS, the toxicity of surrogate cadmium compounds, the environmental fate of ZnCdS, the extent of public exposures from the dispersion tests, and the risks of such exposures.

DESCRIPTION OF TEST

Name of test: *Meteorological Analog Test and Evaluation (Mate): First Field Test*

Reference-list number: 28

Reference: J.K. Allison, A.V. Duffield, and J.M. Morton. Meteorological Analog Test and Evaluation: First Field Test Operation. Final Report. Meteorological Research Laboratory, Melpar Division of American Standard, 7700 Arlington Blvd., Falls Church, Va. Contract DA 42-007-AMC-339(Y), Task VIII B, for U.S. Army Deseret Test Center, Fort Douglas, Utah. June 1970.

Principal object:

To evaluate the equipment systems to be used in the MATE program, which is "a broad, long-range study in applied meteorology," "to measure diffusion and micrometeorology at typical sites and characterize these sites in terms of CB (primarily of diffusion)," and to begin data collection for the MATE program with observations at the first forest analog site.

Site selection:

Sites had to be at least 1 mile square, relatively level, well-forested with mature deciduous trees, and accessible from Melpar laboratories. Two potential sites in Virginia were located, but were subsequently dismissed from consideration (the first because of public concern over the integrity of a Bald Eagle nesting site, the second when it was discovered that a gas transmission line was being built through it). A more extensive search into Maryland located the selected site in the Green Brier Swamp, 12 miles southwest of Cambridge, Md., and permission for use was obtained from the owners of the various parts of the site.

Number and nomenclature of releases:

There were 115 trials, numbered from 1 to 115. Green FP and yellow FP were released in 111. In four, no FP was released. Some additional unnumbered

Toxicologic Assessment of the Army's Zinc Cadmium Sulfide Dispersion Tests
http://www.nap.edu/catalog/5739.html

"trials" involved other operations connected with the MATE program and did not involve any FP release.

Test conditions:

FP releases were made in the center of sampling grids, of which there were four. The main sampling grid consisted of three circular arrays of Rotorod samplers at 100 m radius (every 10 degrees of arc), 200 m and 400 m radius (every 5 degrees of arc). Additional samplers were located on a 1,000-m square ("XM3") grid around the circular grid. Two subsidiary sampling grids ("white" and "yellow") consisting of 100- and 200-m radius circles were constructed, the first off-set by approximately 500 m east from the center of the main grid, the second offset approximately 1 km from the main grid.

The whole site was forested, with trees of typical height 20 to 30 m, and tree density of 150 to 500 per hectare. The last 10 trials were performed after leaf fall to evaluate dispersion characteristics under such conditions.

Test material:

ZnCdS tracer materials. Green-fluorescing, type 3206, Lot SCM FPG-11. Yellow-fluorescing, type 2267, Lot FPY-12. (Note: The analysis dates given for these materials precede the experiment by 4 years.)

Place of release:

Releases were made close to ground level (1 or 1.5 m height, yellow FP, all trials) and at various heights of 1 m to 28 m (green FP). All releases were at the center of one or another of the sampling grids, in most cases with simultaneous release of yellow and green FP in the center of the main grid, occasionally with different colors in the centers of the different grids.

The 1950s Secret Discovery ...

High-temperature Superconductors

(HTSC) contains the theory and basis for the technology used for remotely detecting brainwaves from a distance. Currently the military is developing it for remote sensing. While this may not be the classified mind reading technology used today, the point is to see that the level of technology is possible and the scientific theory behind mind reading can be figured out, even if it is classified. Please note that the Jonathan Tennenbaum article mentions HTSC and it's use for mind control weapons. Here is a list of articles on HTSC with brief comments.

Hewish, Mark. (1992,June 1). High-temperature Superconductors. International Defense Review. Vol.25. No.6;

- Pg. 624. "The United States government Office Of Technology Assessment believes that electronic components using high-temperature superconductors (HTSCs) will be available by the mid-1990s. ...DARPA (the US Defense Advanced Research Projects Agency) has awarded several contracts for work on HTSCs. E-Systems 'Melpar Division leads a team--including several universities and specialist companies such as Superconductor Technologies and Conductus--that has a $9.7 million contract from the agency to demonstrate a feasible approach to defense applications of HTSCs by 1994.
- ...HTSCs first made their appearance in 1986, when two researchers at the IBM laboratories in Zurich--who won a Nobel prize for their work...Radio-frequency energy encounters some resistance even in a superconductor, but this is negligible at frequencies below 1 GHz. ...Most radars of military interest operate at frequencies below 120GHz...

The Washington Post

MELOY PACKS ITS TEST TUBES FOR NEW HOME

By Malcolm Gladwell

March 21, 1988

Meloy Laboratories, one of the Washington area's pioneering biomedical research companies, is moving out.

Over the next few weeks, Rorer Group Inc., the large Pennsylvania pharmaceutical company that bought Meloy two years ago, will move Meloy's Springfield laboratory and 80 of its scientists to Rorer's central research facility in Fort Washington, Pa.

The loss of Meloy is not a major blow to this area's burgeoning biotechnology community -- there are more than 100 biotech firms in the area, with companies coming and going each month.

But in many ways Meloy -- which grew out of the concerted effort to find a cure for cancer in the early 1970s and then was drawn away from government contract research by the commercial promise of genetic engineering -- is the archetypal Washington biotech firm. Many observers say its fate is a portent of changes that may ripple through the region's biotechnology community over the next few years.

Meloy is being moved to Pennsylvania so that its biotechnology expertise can be meshed with Rorer Group's multimillion-dollar drug research program. Virtually every major pharmaceutical company is making a similar investment in biotechnology, as it has become increasingly clear that genetic engineering will have a major impact on the way drugs are developed.

The result is a new concentration of resources in the biotech field and increased competition in key product areas, which some experts say could force some of the many biotech start-ups into bankruptcy, limit others to niche markets and push still more, like Meloy, into the arms of major pharmaceutical houses.

"People have been talking for years about a shakeout in the biotech industry," said L. Patrick Gage, vice president and director of exploratory research for the Nutley, N.J.-based American arm of Hoffmann-La Roche Inc., the Swiss drug giant. "I think it's finally coming."

Meloy had grown to $10 million in revenue from contract research by 1975 when it was acquired by Revlon Inc.'s drug division. That division, which also included USV Pharmaceutical Corp. and Armour Pharmaceutical Co., was in turn bought by Rorer in January 1986.

At the time, Meloy was only a small portion of the deal, which was part of Rorer's attempt to increase its pharmaceutical muscle. But later, when it became clear that Rorer needed to build a base in biotechnology, its management took a closer look at Meloy. "They'd brought in top-notch scientists and were doing some exciting work," said Rorer Chairman Robert F. Cawthorn. "We said, 'Boy, we've got a real gem here.' "

Robert L. Gawthrop. "We said, 'Boy, we've got a real gem here.'

What attracted Rorer to Meloy was the same thing that has attracted many of the major pharmaceutical companies to biotechnology -- expertise in the use of recombinant DNA techniques to screen chemical compounds for their potential as drugs.

In the past, new drugs were discovered by testing thousands of synthetic compounds on living organisms, a process that, at best, yielded one promising substance in 1,000. But by studying the chemical structures of cells linked to particular medical problems, biotechnology has made it possible to screen potential drugs far more effectively.

This process, known as receptor technology, allows scientists "to ask the right biological questions," said Dr. Alain Schreiber, who is heading up the integration of Meloy into Rorer. "Instead of using a shotgun approach, we can use a pointed rifle."

Meloy has two scientists on its roster from the Wietzmann Institute in Israel with international reputations in receptor work, and down the road the Meloy team hopes to lead Rorer into a second potentially revolutionary stage in drug development: allowing for the engineering of drugs to precise biological specifications by giving scientists a precise understanding of the nature of disease. Drug design, as it is known, promises to remove the guesswork from drug development and to allow for the creation of stable, targeted chemical compounds that are less prone to side effects.

"The dream of every chemist and every pharmaceutical house is to have rational design of their drugs -- to have a scientist sit down and draw a chemical compound on paper," Schreiber said.

In pursuit of this, Rorer has taken a drugdevelopment staff of about 100 scientists and supplemented it with an equivalent number of biologists from the Meloy group. Many of the other major drug firms are doing the same thing, looking to supplement the synthetic chemistry that has dominated drug development so far with expertise in biotechnology.

"In a decade, bioscience will be the major driving force behind drug development, and chemistry a tool," predicted Ralph Hardy, deputy chairman of Boston's Biotechnica International Inc. "At the moment, it's the opposite."

But drug companies are not simply turning themselves into biotech firms. For example, as Smith Kline & French, the research division of pharmaceutical giant SmithKline Beckman Corp., has hired about 200 biotech scientists in recent years the company's principal concern has been integrating the skills of the newcomers with those of the chemists. "We wanted molecular biologists to understand the existing world and wanted the reverse osmosis among our traditional scientists so they could begin to understand what molecular genetics was all about," said George Poste, the company's vice president for research.

If biologists design drugs in the future, it will be in tandem with chemists, who will construct the chemical compounds designed by the biologists.

Rorer felt it necessary to move Meloy Laboratories from Springfield to a building adjacent to the company's research center in Fort Washington for

building adjacent to the company's research center in Fort Washington for the same reason. Company officials say they want Meloy biologists to work more closely with Rorer's chemists.

Of course, not every small biotech company is destined to be swallowed whole by a giant like Rorer Group. But the enormous demands involved in integrating traditional chemistry and biotechnology for drug development in the next decade have made it less likely, according to industry experts, that many smaller companies looking to produce drugs can survive.

Although some biotech firms, like California's Genentech Inc., appear to have already made the leap from start-up to the pharmaceutical major leagues, and other older firms, like California's Amgen and Boston's Genetics Institute, have been touted as likely followers, analysts doubt whether many other companies are capable of finding the capital to join them.

"The time of the high market valuation for biotech companies is over," Schreiber said. "People have realized how difficult and expensive it is to bring a new therapeutic to market. The hype is gone."

Among the rest of the hundreds of biotechnology companies in the health care sector, there already seems to have developed a split between those small firms struggling to compete with pharmaceutical companies hundreds of times their size in the development of new drugs and biotech firms thriving on much more modest niche markets in medical devices.

The division is especially marked in the Washington area, where the majority of the most promising biotech health care firms -- such as Biotech Research Laboratories Inc., one of the nation's principal manufacturers of tests for acquired immune deficiency syndrome -- are in the business of producing recombinant DNA diagnostic kits.

"There will always be a trend toward fewer players in the pharmaceutical business because the costs of launching a product are so great. With diagnostics, the costs of approval are less, and the demand for differentiated products is much greater," said Leon Taub, president of Digene, a College Park firm that has, among other things, developed a DNA diagnostic test to supplement a pap smear.

"Diagnostics are a very different business," said Steve Turner, president of Gaithersburg's Oncor Inc., another local company that has made a successful entry into that market. "It's more like trench warfare. Products evolve rapidly, and you have to make constant changes. That fits more into themodus operandi of a smaller business."

For biotechnology firms in other parts of the health care market, the future is less certain. And in the Washington area, where -- unlike the thriving biotechnology communities in northern California and Boston -- there are no clear giants emerging, some analysts say that further absorption of small firms by large pharmaceutical companies is a distinct possibility.

"The ones that really have something are likely to be eaten up," said Thomas Taylor, an analyst with Chesapeake Securities in Towson.

And the others? "I think many of them are just going to die."

Charlie Merritt

Charlie Merritt got his start in cryptography in 1977 in Houston, where he was technical director of a microcomputer marketing company. A friend in Arkansas sent him a copy of the original MIT public key paper by Rivest, Shamir, and Adleman. The friend wanted to know if RSA could be implemented on a microcomputer.

Merritt said, "Yes."

In 1980 Merritt moved to Fayetteville, where he formed a company with two other people to create an encryption system for Z80-based computers running the CP/M operating system. Merritt was right: RSA could run on the puny microcomputers of the time. It ran slowly but not as slowly as Merritt had feared. "We thought it would take a week or two to generate a 'pretty big' key. Encryption of a file might take 20 minutes," Merritt recalls. "Well, we did better than that. 256bit keys generated in 10 minutes; a small file encoded in 20–30 seconds."

Merritt and his friends started selling a system called DEDICATE/32, which performed encryption using 32byte (256bit) keys. After a while he had a falling out with his two partners and set up a new company called Merritt Software, which contracted with Merritt's former company to market DEDICATE/32.

By 1983 Merritt Software was having a problem: "Most interest came from business people who wanted privacy from Banana Republic competitors that had bribed 'El Jefe' or were related to him," he says. The company also kept getting visits from NSA employees ("They always travel in pairs," Merritt says) who informed Merritt Software that their RSA programs were "munitions" and couldn't be legally exported to any country in the world except Canada. "We had few customers as close as Canada. Evil spies could buy crypto in the U.S. and sneak it 'over there' and copy the beeJesus out of it, but I couldn't make an honest $50 by selling it to a business person who wanted privacy!" Merritt complains.

Merritt's call to Metamorphic was actually a marketing gimmick. Merritt had bought a few computer magazines and was calling every single company that might be the least bit interested in having his RSA encryption package run on its computer. (At this time, RSA had no known patent restrictions. Although MIT had filed for the patent on the RSA encryption algorithm, the patent had not yet been issued.)

Zimmermann "was the most gee-whiz-whoopie enthusiastic character I had run into," recalls Merritt. "He didn't have a need for crypto, but as he told me, he had been interested in ciphers since the Boy Scouts had introduced him to the subject. He was the only person I had run into that knew nothing about public keys, and wanted every single detail on how to do it. The thought crossed my mind that he might be a practical joke inspired by a friend."

Zimmermann told Merritt that he was anti-Big-Brother. Merritt liked that; he was really angry at the NSA for almost driving his company out of business with its policy against exporting cryptography. The two hit it off.

Indeed, Zimmermann had a lingering interest in cryptography since he had been a small boy; he simply hadn't had anyone to share it with and any practical knowledge of how to implement it. In fourth grade, Zimmermann found a copy of the book, Codes and Secret Writing by Herbert S. Zim, and read it cover to cover. "It was really cool," remembers Zimmermann. "I learned Morse code and Braille from it, and made invisible ink from lemon juice." A few years later, Zimmermann was making code wheels and transposition ciphers. He made codes in college with the school's computers. He even knew about the RSA algorithm that Merritt was using because he had written Ron Rivest asking for a copy of the RSA paper described in Scientific American.

Zimmermann had considered writing his own RSA implementation shortly after he received the original MIT paper but quickly gave up: microcomputers, Zimmermann thought, were just too slow. And here was Charlie Merritt, who had gotten RSA to work on a puny Z80. How did Merritt do it?

Merritt showed Zimmermann how. The Arkansas programmer had no formal training in mathematics, but he had taught himself the secrets of doing arithmetic with 100-digit numbers on a personal computer. Now he was teaching Zimmermann.

"He called more than once a week for [several] years," recalls Merritt. "He at first knew virtually nothing, but as time went on he began to grow quite formal. It was during this early time that he and I talked about his 8088 card for the Apple II and putting crypto on it. He studied the DES and gave me my first understandable explanation of why the cipher feedback would not melt down on a communication error.

I realized that this guy was real, and that he had a vision I had given up. He had drive, I felt beat. He began talking about protocols, in great detail. For hours, on the phone. I hate protocols, that's for the Phone Company. But he needed a brick wall. Then he began asking exactly how math was implemented on a Z80. I mean detailed stuff about memory allocation, and adding two giant numbers and what about the carry bit. We were back in my territory."

Merritt's territory, it turned out, was programming computers in assembly language—the actual machine code used by the computer. Zimmermann was a C programmer. He wanted to program in a language that could be run on more than one computer. Merritt thought that C was some sort of "weird language

programmer. He wanted to program in a language that could be run on more than one computer. Merritt thought that C was some sort of "world language" that PRZ

[Zimmermann] was hot on." Zimmermann sent Merritt a copy of Kernighan and Ritchie's C bible, with an inscription that said "Move into the 1980s." It was June 1985.

Phil Zimmermann Meets Public Key

Although the mathematics behind the RSA algorithm are theoretically simple, the difficulty of writing an RSA program is in performing the actual arithmetic. Making RSA work requires that you multiply numbers that are hundreds of digits long, then take those numbers to very high exponents, and finally perform modulo arithmetic.

Most computer languages have multiplications, exponentiation, and modulo-division built in, but they are limited in their precision to 10, 15, or 20 digits. To make RSA work securely with 200-digit numbers, you must write your own multi-precision arithmetic functions. While you can easily find these algorithms in textbooks today, such algorithms were relatively obscure just ten years ago. They were also difficult to teach over the telephone, as Merritt and Zimmermann discovered.

By the summer of 1986, Merritt and Zimmermann decided to have their first face-to-face meeting. The stated purpose of the trip was to teach Zimmermann the fine details of performing multi-precision arithmetic on a computer. Zimmermann was thinking of starting on his own project: an implementation of RSA for the computer that seemed to be taking over the world, the IBM PC. Merritt would fly to Boulder and stay with Zimmermann and his family for a week.

For Merritt, there was a second purpose for the trip as well. For more than a year, Merritt had been doing contract work for RSA Data Security, the company that Ron Rivest, Adi Shamir, and Len Adleman had started back in 1983. In February of 1986, RSADSI had hired a new employee, Jim Bidzos, who had risen to become the company's president within a year, firing all of the company's other employees and hiring his own team in the process. Merritt wanted to meet Bidzos. As for Bidzos, he had business in Denver: it was a simple matter to cruise down to Boulder and see Merritt. Meeting Merritt in Boulder was a lot easier than flying to Arkansas. The meeting was set.

A few days before Merritt flew to Boulder, he touched base with Bidzos. Bidzos said that he knew one of the best steak houses in Boulder. Merritt and Bidzos planned to go "eat thick slabs of dead cow, drink, and smoke some fine cigars in a dim steak house," recalls Merritt. "What a good way to meet someone you had been doing business with." To Bidzos, the fact that he was also going to be meeting Phil Zimmermann was inconsequential.

Face to Face with Jim Bidzos

Boulder, Colorado. November 1986. From the first moment that Merritt, Bidzos, and Zimmermann met, the three were off to a rocky start. Merritt found himself in the middle. On the one hand, Merritt's politics were more in line with Zimmermann's: neither trusted the government. Merritt had protested against the war in Vietnam, whereas Zimmermann was in the middle of his crusade against the nuclear arms race. Bidzos, Merritt learned, had volunteered for the U.S. Marines despite his being a Greek citizen. And yet, Merritt was working for Bidzos—and on a military contract, at that. When Bidzos learned that Zimmermann was a programmer, he asked Zimmermann if he wanted to help on a contract for the United States Navy. The contract wasn't classified or relevant to weapons, but Zimmermann refused. Sure, he needed the money, but how could an anti-nuclear peace activist work on a military contract?

Bidzos brought with him two copies of RSA Data Security's new MailSafe product, the program Ron Rivest wrote to sign and encrypt electronic mail. In many ways,

MailSafe was similar to the program that Zimmermann was thinking of writing.* Bidzos left a copy of the program with Zimmermann. They talked about encryption, and Zimmermann claims that during their meeting, Bidzos offered him a free license for the RSA algorithm—a claim Bidzos hotly disputes. The three then set their minds on dinner, and the evening continued to go downhill.

(* Despite MailSafe's similarities to PGP, Zimmermann says that he doesn't remember much from the demonstration and that he promptly lost his copy of MailSafe after Bidzos left.

Bidzos, on the other hand, claims that PGP is little more than a bad ripoff of the ideas that originated with MailSafe. It is true that the two programs have the same basic functionality, but they differ in two very important ways. The first has to do with the user interface: MailSafe has a graphical user interface, while PGP can be run only from the command line. The second is that MailSafe's system for encoding binary data as ASCII has a simple error-correction system that can correct some kinds of transmission errors — an important feature for people who are sending encrypted files by modem.)

Zimmermann vetoed the idea of going to the steak joint: he didn't drink and didn't smoke and he wasn't much of a meat-eater.

As the host of the evening, he had some influence on where the three men went for dinner. They ended up in the no smoking section of a well-lit restaurant that Merritt says was "PC before PC was PC."

"I was mixed up," recalls Merritt. "Jim and PRZ weren't. They flat out didn't get along. Jim kept pulling me aside, asking what was wrong with PRZ. PRZ kept giving me disgusted looks about the reactionary sitting with us." "Zimmermann kept saying he wanted to move to Canada so his tax dollars wouldn't go to military defense," recalls Bidzos. "I explained that Canadian tax dollars do the same."

Bidzos left for California the next day. Merritt stayed for a week at Zimmermann's house, teaching him everything he knew about doing fast arithmetic with huge numbers on a microcomputer. Phil's wife was a wonderful cook, Merritt recalls, and the house was a comfortable yuppie-ish place with a hippie crashpad feel to it.

"When I left, PRZ knew how my codes worked. He knew 95 percent of what I knew. He was now a 'real danger' to the national security machine."

Micro encryption devices protect your secrets

By Tom Shea, IW Staff

Three different kinds of encryption devices are available for small computers: chip-on-a-card devices, outboard hardware devices and software encryptors.

A start-up company in Washington, D.C., is offering the Osborne computer with a built-in DES (data-encryption standard) board and its own telecommunications software. Cypher Communications Technology (CCT) bundles encryption capability with special communications routines to create a portable communications device with built-in security. Called the CCT-01, the portable reportedly enables users to send messages via the public packet-switched networks (e.g., Telenet and Tymnet) in encrypted form. The firm also "upgrades" existing terminals with encryption and communications capabilities.

Jones Futurex of Fair Oaks, California, offers another DES encryption product of the chip-on-a-board variety. The Encryptor works with the Apple II ($250), the IBM PC ($300) or S-100-bus computers ($400). The board plugs into a slot in the computer, giving users encryption capability.

Racal-Milgo of Miami, Florida, sells an outboard hardware device called the DataCryptor II. The DataCryptor is a box that is connected via an RS-232 port to a small computer. The output of the encryption device then feeds into the modem, and from there to the phone line. Reportedly, the DataCryptor II uses a combination DES and proprietary encryption scheme. The latest version of the device can send messages over the phone company's dial-up network, thus avoiding the expense of using leased lines. Prices for the dial-up version start at $2300.

Several firms offer software encryption products for small computers; each has its own approach.

Prime Factors of Oakland, California, sells a fast (for software) version of DES called Micro Psypher. The firm, which has a history of creating secure systems on mainframes, has employed table-lookup techniques and other tricks to speed up the encryption process. Micro Psypher encrypts CP/M files; it costs $79.95 and comes with an extensive manual.

Public Key Systems (PKS) of Fayetteville, Arkansas, sells a software public-key encryptor called the Dedicate/32. Actually a hybrid system, Dedicate/32 uses the slow public-key RSA (Rivet, Shamir, Adleman) algorithm to exchange the encryption key between the sender and receiver. It then uses that key with a fast proprietary algorithm to scramble the rest of the data for transmission.

According to Charles Merritt of PKS, the proprietary system is even more secure than the supposedly unbroken RSA system. "It's flat-out unbreakable," Merritt claims. Dedicate/32 works with Z80-based computers; it costs $255.

The DES and RSA encryption algorithms appear to be highly secure—unless and until someone breaks them and announces that accomplishment publicly.

Proprietary systems

But some other enciphering schemes are unknown quantities. Such proprietary systems have been subjected to less public scrutiny; fewer cryptanalysts have attacked these ciphers and attempted to break them. Because the details of the encrypting techniques are not usually known, a "spook factor" comes into play, making it difficult to assess their strengths and weaknesses. This very secrecy may be a bulwark against cracking these ciphers. On the other hand, the secrecy may only conceal a paper tiger.

Among firms offering such proprietary systems are Passage Research of San Diego, California, which sells a DES-like system called Classified, reportedly for less than $50. Century Systems of Garden Grove, California, sells a $250 software encryptor for CP/M systems called ComCrypt.

A slew of companies now manufacture DES microprocessor chips that have been certified by the National Bureau of Standards (NBS). These chips find their way into plug-in boards and other computer encryption equipment.

Among the California makers of DES chips are Fairchild Semiconductor of Mountain View, Intel of Santa Clara, Advanced Micro Devices of Sunnyvale and Western Digital of Newport Beach. Hewlett-Packard is also reportedly getting ready to announce a DES chip. This list includes many of the big integrated-circuit makers of Silicon Valley.

Some DES implementations contain the entire device on a single LSI (large-scale integration) chip; others offer a four-chip set, or processor-chip and ROM combinations. The cheapest versions start at around $20 in large quantities.

East Coast manufacturers include IBM in White Plains, New York, and Nixdorf Computer of Burlington, Massachusetts. ■

"**MERRITT --** Robert M. Merritt, a second-generation native New Mexican, passed away on march 6, 1999 after a long illness. He was born on May 16, 1924, in Lucy, New Mexico. He was preceded in death by his parents, Thomas E. and Rose D. Merritt; brother, Lee Weldon Merritt and a sister, Tommie J. Vaughan. **Robert is survived by two brothers, William C. Merritt of Truth of Consequences, NM and George L. Merritt of Houston, Texas and four sisters, Opal Garland of Estancia, NM, Lucy Clark and Ina Mitchell of Albuquerque, NM and Lynette Cox of Renton, WA**; many nieces and nephews and cousins. Robert received his BS degree in Electrical Engineering from the University of New Mexico after serving in the US Army in World War II. He also completed many courses at the Geo Washington University in Washington, DC. He was wounded in the Battle of the Bulge suffering a shattered hip. He was a member of the National Society of Professional Engineers, The Illuminating Engineering Society, American Institute of Electrical Engineers and the Institute of Radio Engineers, Sigma Tau Chi Fraternity Chapter and The Society of American Military Engineers. **He was employed by the Department of the Army Corps of Engineers for 27 years serving many of these years in the Middle East building military bases, specifically designing electrical generation and distribution systems for which he was awarded Sustained Superior Performance awards.** He received laudatory comments from the Secretary of Defense Weinberger and Secretary of the Army Marsh regarding his performance during the construction of the Neger-Airbases for world peace-especially in the Middle East. He was a member of the Ewing Community Baptist Church. He attended the Ewing Community Elementary School and graduated from Estancia, NM High School. After returning from the Corp of Engineers, he returned to his farm in the Ewing Community residing there until his illness prevented this. Interment will be in the Santa Fe National Cemetery in Santa Fe, NM after a private service at French Mortuary, 7121 Wyoming Blvd. NE. "

Parents learn vaccine not all-powerful

Whooping cough: Cases at Cobb school show limits of current inoculations, but they are an essential weapon for now, doctors say.

ALISON YOUNG
spotlight
@ajc.com

A cluster of whooping cough cases among Cobb County elementary students is adding to concerns that an important vaccine isn't as effective as it needs to be to stop the spread of disease.

Whooping cough, also called pertussis, is highly contagious and can cause serious illness among infants and very young children. But the vaccine is only about 85 percent effective and wears off over time, leaving a significant number of children and adults vulnerable to an infection that is more common than many realize, health officials said.

Of the 18 students in the recent Cobb cluster, 17 were properly immunized with five doses of DTaP vaccine, which protects against diphtheria, tetanus and pertussis, health officials said.

The Centers for Disease Control and Prevention has been studying the Cobb cases. While a better

Vaccine: Pertussis cases on rise

➤ Continued from B1

pertussis vaccine is needed, CDC officials said, the available shots are still the best protection against the disease and they reduce the severity of symptoms in people who are infected.

"Despite the fact that we routinely vaccinate against pertussis, pertussis is endemic. There's lots of pertussis," said Dr. Nancy Messonnier, director of CDC's meningitis and vaccine preventable diseases branch.

But scientists are struggling to understand why reports of pertussis cases have risen dramatically since the 1980s. It may reflect more testing or diagnosis; it may reflect the cyclical nature of the disease. It's even unclear how often clusters like the one in Cobb occur.

"We are frustrated by the fact that we don't know," Messonnier said.

About 10,000 cases and 20 infant deaths were reported in the United States last year, but some studies have suggested the number of people sickened each year may be closer to 300,000, CDC officials said.

Experts believe the disease is underdiagnosed and underreported in vaccinated school-age children and adults who often have milder symptoms and whose childhood shots have worn off. They believe that adolescents and adults are spreading the disease to vulnerable infants and children.

In an effort to stop this under-the-radar disease transmission, the CDC about four years ago began recommending that adults and adolescents get pertussis booster shots. The goal is to increase "herd immunity" — the more people who are immune, the harder it is for the disease to spread to those who aren't protected because the vaccine didn't work for them or because they aren't vaccinated.

It's too early to tell whether the adult and adolescent booster shots will curb the spread of pertussis because it can take years for a significant number to get shots.

CURTIS COMPTON / ccompton@ajc.com

Eight-year-old **Charlie Wood**, shown studying with twin sister **Emily**, became ill with whooping cough. The Kincaid Elementary third-grader got sick despite being fully vaccinated. Emily didn't get sick.

While no vaccine is 100 percent effective, some parents are surprised and angry that a vaccine they trusted is failing to protect some children. And officials with the Georgia Division of Public Health said too many local doctors are not aware the disease is circulating in the community and can infect fully vaccinated children.

Earlier this month, the state health department sent a blast fax to area pediatricians and family doctors alerting them to be on the lookout for pertussis.

East Cobb parent Laurie Wood assumed her children were protected because they'd received all the shots. Then her 8-year-old son, Charlie, developed a cough so severe it caused him to vomit. In January, Charlie was diagnosed with pertussis.

"I was scared because he's been vaccinated," Wood said last week. "I also was mad because if the vaccination wasn't working, we should have known about it."

So far this year, 48 pertussis cases have been reported in Georgia, continuing an uptick in reports to state health officials that began last year when 103 cases were reported. Five Georgia infants have died from whooping cough since 2004.

Whooping cough starts with coldlike symptoms, but after a week or two, a severe cough can develop. Children can cough violently until all the air in their lungs is gone and they inhale with a "whooping" sound.

Between August and February, 18 cases were reported at four elementary schools in the Cobb County School District, including two third-graders at Mountain View; two second-graders and two fourth-graders at Garrison Mill; and three first-graders at Timber Ridge. Nine children had the disease at Rocky Mount Elementary: three third-graders, three fourth-graders and three fifth-graders.

Wood's son Charlie is a third-grader at Kincaid Elementary — just a few miles from Mountain View.

It was somewhat surprising that so many of the cases involved young children who were fully vaccinated, said Stacey Martin, a CDC epidemiologist who was involved in investigating the cluster.

Nationally, school-age children diagnosed with the disease are generally teenagers, which is what prompted a CDC advisory panel in 2005 to recommend an additional pertussis booster shot at age 11 or 12.

To try to determine the magnitude of the problem at the four Cobb schools, last month CDC and local health officials gave voluntary pertussis tests to 108 children and staff who were currently coughing, and 22 of them showed evidence of recent infection, said Julie Gabel, a state health department epidemiologist.

Despite the study's test results, some doctors refused to believe parents when they said that their children had pertussis. "More than one said to the parent: 'Well, your child couldn't have had pertussis, your child's been vaccinated," Gabel said, adding that the department is working to educate physicians.

At the four schools, health officials think the outbreaks are over or winding down. But whooping cough continues to be reported elsewhere. Georgia health officials aren't aware of any other current whooping cough clusters.

Dr. Walter Orenstein, a leading vaccine expert, was surprised to hear that the Cobb cluster involved young students who would have received a pertussis booster as they entered school.

"The real issue is what the rate of vaccine failure is," said Orenstein, a former CDC official who recently became deputy director for vaccine preventable diseases at the Gates Foundation in Seattle.

It's possible, Orenstein said, that the sick children were simply among the expected 15 percent of people immunized that the vaccine fails to protect.

Despite concerns about pertussis, the reported cases are still far fewer than before a vaccine became available.

In the 1920s and 1930s, there were more than 160,000 cases and more than 5,000 deaths each year. After the introduction of a pertussis vaccine in the 1940s, reports dropped dramatically. In 1976, just 1,010 cases were reported — the record low.

Whether it's possible to develop a more effective pertussis vaccine is a matter of scientific debate. But Dr. John Robbins, a scientist at the National Institutes of Health, has urged in scientific journals that a more effective vaccine be made using a different way of creating the component that produces immunity.

"I think we'd probably get rid of the disease," Robbins said.

Vaccine manufacturers aren't looking for more effective vaccine because the current one is "good enough" — especially once more adolescents and adults start getting booster shots, said Dr. Michael Decker, a vice president at Sanofi Pasteur. His company and GlaxoSmith-Kline make pertussis vaccines.

Decker said there's nothing unusual about the Cobb cluster. Until the U.S. population is more thoroughly vaccinated and receiving booster shots, he said, such clusters will occasionally occur across the country. "I look at this and see absolutely nothing remarkable," he said.

WHAT YOU NEED KNOW

➤ **What is whooping cough?** A contagious disease caused by bacteria called Bordetella pertussis.
➤ **What are the symptoms?** At first: runny nose, congestion, sneezing, and perhaps a mild cough or fever. After one or two weeks, a severe cough begins that can be so violent and repeated that children are forced to inhale with a loud "whooping" sound.
➤ **Who's at risk?** Infants and very young children develop the most severe illness. More than half of infants younger than 1 must be hospitalized.
➤ **How is it spread?** Coughing and sneezing while in close contact with other people.
➤ **How is it prevented?** Vaccination. **Children:** Five shots of DTaP vaccine (which protects against diphtheria, tetanus and pertussis): Given at 2, 4 and 6 months of age; the fourth shot is given when the child is between 15 and 18 months old; the fifth shot is given when the child enters school, around 4-6 years old. **Pre-teens:** One booster shot — called a Tdap — during their regular check-up when they're 11 or 12 years old. Tdap protects against tetanus, diphtheria and pertussis. **Adults:** Adults also should get one Tdap shot, to increase their pertussis immunity if they didn't get one when they were a pre-teen.

Preteens need only 2 HPV shots, not 3, panel says

By MIKE STOBBE
The Associated Press

NEW YORK — It may soon be easier for preteens to get the vaccine against cervical cancer. A government panel is recommending they get fewer shots spaced further apart.

Since the HPV vaccine went on sale a decade ago, three doses have been needed. The panel decided Wednesday that two doses are enough.

"It will be simpler now for parents to get their kids the HPV vaccine series, and protect their kids from HPVcancers," said Dr. Nancy Messonnier of the Centers for Disease Control and Prevention.

The vaccine protects against human papillomavirus — or HPV — which can cause cervical cancer, certain other cancers and genital warts. It is commonly spread through sex and, in most cases, the virus doesn't cause any problems. But some infections gradually lead to cancer.

Health officials want kids to get HPV vaccinations at age 11 or 12, well before most first have sex and before they could be infected.

But less than one-third of 13-year-old U.S. boys and girls have gotten three doses. Busy parents have struggled with the old schedule, which called for three trips to the doctor within six months.

"I know people who say 'I can't do that. Why even start?'" said Cynthia Pellegrini, a March of Dimes official who sits on the panel.

Recent studies have shown two doses of the current HPV vaccine — Gardasil 9 — work just as well in kids ages 9 to 14. The Food and Drug Administration two weeks ago said it could be given in two doses.

MERCK VIA AP

This image shows a vial and package for their GARDASIL 9 human papillomavirus vaccine. Yesterday, a government panel said preteens need only get two doses of HPV vaccine instead of three, a move some hope will raise languishing HPV vaccination rates.

What's more, two doses apparently work better when spaced six to 12 months apart. That means they could be given at annual checkups.

The Advisory Committee on Immunization Practices made the recommendation at a meeting in Atlanta. CDC officials usually adopt the panel's advice and send it to doctors and the public.

The vaccine was first recommended in 2006 for girls, and then for boys in 2011 — partly to reduce the spread of HPV to girls.

Vaccination rates have risen very slowly, and health officials have lamented the underuse of a potent cancer prevention tool.

Too many doctors have been timid about promoting the shots, experts say. That's at least partly because some parents have worried the vaccination seems like they are greenlighting their kids to have sex.

But the onerous schedule sure didn't help. "I think it was the icing on the cake" for parents already hesitant about HPV shots, said Dr. William Schaffner, a vaccines expert at Vanderbilt University.

The panel is sticking to three doses for anyone who doesn't get their first shot until they turn 15. That's because they didn't have enough data on how well two doses worked in older kids.

Until recently, there were three HPV vaccines on the market. Now there's only one — Merck & Co.'s Gardasil 9. This month, the company stopped selling an older version. GlaxoSmithKline phased out its vaccine, Cervarix, in the U.S. because of poor sales.

How 'completely avoidable' measles cases continue to climb

By Lauran Neergaard
AP Medical Writer

Widespread misinformation is strong contributing factor

WASHINGTON — The U.S. has counted more measles cases in the first two months of this year than in all of 2017 — and part of the rising threat is misinformation that makes some parents balk at a crucial vaccine, federal health officials told Congress on Wednesday.

Yet, the vaccine is hugely effective and very safe — so the rise of measles cases "is really unacceptable," said Dr. Anthony Fauci, infectious disease chief at the National Institutes of Health.

The disease was declared eliminated in the U.S. in 2000, which means it was not being spread domestically. But cases have been rising in recent years, and 2019 is shaping up to be a bad one.

Republican and Democratic lawmakers at the House Energy and Commerce subcommittee hearing bemoaned what's called "vaccine hesitancy," meaning when people refuse or delay vaccinations.

"These outbreaks are tragic since they're completely avoidable," said Rep. Brett Guthrie, R-Ky.

"This is a public health problem for which science has already provided a solution," agreed Rep. Frank Pallone, D-N.J.

Here are some questions and answers about measles:

Q: How dangerous is measles?

A: Measles typically begins with a high fever, and several days later, a characteristic rash appears on the face and then spreads over the body. Among serious complications, 1 in 20 patients get pneumonia, and 1 in 1,000 get brain swelling that can lead to seizures, deafness or intellectual disability.

Although it's rare in the U.S., 1 or 2 of every 1,000 children who get measles dies, according to the Centers for Disease Control and Prevention.

Q: How does it spread?

A: By coughing or sneezing, and someone can spread the virus for

› *MEASLES, 4A*

[HN00RQ][GDrive]

Measles

CONTINUED FROM PAGE 3A

2019-03-03-lawrence-journal-world-pg-4a-clip-measles

four days before the telltale rash appears, Fauci warned.

The virus can live for up to two hours in the air or on nearby surfaces. Nine of 10 unvaccinated people who come into contact with someone with measles will catch it. Fauci called it "one of the most contagious viruses known to man."

Q: How widespread is measles?

A: In the U.S., the CDC has confirmed 159 cases so far this year in 10 states: California, Colorado, Connecticut, Georgia, Illinois, Kentucky, New York, Oregon, Texas and Washington. That compares to 372 cases last year, and 120 in 2017.

But measles is far more common around the world — the World Health Organization said it claimed 110,000 lives in 2017. The WHO says there's been a 30 percent increase in measles cases in recent years. Unvaccinated Americans traveling abroad, or foreign visitors here, can easily bring in the virus.

For example, a huge outbreak in Madagascar has caused more than 68,000 illnesses and 900 deaths since September. But you don't need to go as far as Madagascar — common tourist destinations like England, France, Italy and Greece had measles outbreaks last year, noted CDC's Dr. Nancy Messonnier. Nearly 83,000 people contracted measles in Europe in 2018, the highest number in a decade.

Q: How many U.S. children are vulnerable?

A: Overall, about 92 percent of U.S. children have gotten the combination vaccine that protects against measles, mumps and rubella, known as the MMR vaccine. Two shots are required, one around the first birthday and a second between age 4 and 6. Full vaccination is 97 percent effective at preventing measles.

But the CDC says 1 in 12 children don't receive the first dose on time, and in some places vaccination rates are far lower than the national average. For example, an outbreak in Washington state is linked to a community where only about 80 percent of children were properly vaccinated.

Q: Is the vaccine safe?

A: Yes, said Fauci and Messonnier, who point to decades of use by millions of children each year — and who made sure their own children were vaccinated.

In the late 1990s, one study linked MMR vaccine to autism, but that study was found to be a fraud, and Fauci said later research found no risk of autism from the vaccine.

Still, misinformation about MMR safety is widespread. Fauci said the solution isn't to criticize people who have no way to know what's false. Instead, "we need to educate them to show them what the evidence is."

Q: Why isn't everyone vaccinated?

A: Some people can't be immunized for medical reasons — including infants and people with weak immune systems — and most states allow religious exemptions. But although vaccination against a list of contagious diseases is required to attend school, 17 states allow some type of nonmedical exemption for "personal, moral or other beliefs," according to the National Conference of State Legislatures.

Kansas law allows for religious, but not philosophical, exemptions.

In Washington state, lawmakers are debating ending that personal or philosophical exemption, as are several other states. California ended a similar exemption in 2015 after a measles outbreak at Disneyland sickened 147 people and spread across the U.S. and into Canada.

MFS Communications Company, Inc. (Metropolitan Fiber Systems) was a competitive local exchange carrier that owned and operated local network access facilities installed in and around major U.S. cities and several major European cities. MFS also possessed significant transmission and switching facilities and network capacity that it leased from other carriers in the United States and Western Europe.

History

- The company was founded in 1988 as Kiewit Communications, a subsidiary of Kiewit Corporation.
- By 1991, the company owned fiber-optic lines that serve large business customers in 11 cities.
- In 1993, the company became a public company via an initial public offering.[2]
- In April 1996, the company announced the acquisition of [**UUNET Technologies, Incorporated**] .
- In August 1996, [**WorldCom Corporation**] announced the acquisition of the company[5] and the transaction was completed in December 1996.[1]Worldcom filed bankruptcy in 2002.
- Level 3 Communications and NorthPoint Communications were founded by former executives of MFS.

A leading provider of communication services for businesses and government agencies in the United States, MFS Communications Company, Inc. competes with regional telephone companies by supplying such customers with telephone and data services through fiber-optic networks, enabling its customers to place long-distance telephone calls and transmit data without going through the local phone utility. Through five subsidiary companies, divided into two business segments, telecommunications services and network systems integration and facilities management, the company operated in 24 U.S. cities in 1994, with additional operations in the United Kingdom and Germany. Before the conclusion of the decade, MFS Communications planned to extend its service area to approximately 50 additional cities, an objective that included establishing service in ten international markets.

One of a new breed of telecommunication companies engendered by the deregulation of the telephone industry in the early 1980s, MFS Communications began operating in 1988 as a wholly owned subsidiary of Kiewit Diversified Group Inc., which in turn was a wholly owned subsidiary of Peter Kiewit Sons'Inc., one of the largest construction and mining companies in the United States. Peter Kiewit Sons ' entered the telecommunications business as part of a diversification strategy the company effected during the early 1980s, engaging in a series of acquisitions that led to the formation of Kiewit Holdings Group in 1986. From Kiewit Holdings Group evolved Kiewit Diversified Group, which oversaw the parent company's interests in telecommunications and incorporated MFS Communications ' predecessor, Kiewit Communications Company, Inc., in 1987.

Led by James Q. Crowe, who would continue to oversee the company once it became MFS Communications, Kiewit Communications was founded to test a theory formulated by himself and other members of Kiewit's management regarding the rapidly changing telecommunications market, the dynamics of which were transforming in the wake of the consent decree that deregulated the telephone industry and ushered in a new era of competition. Before deregulation, they theorized, competition in the telecommunications industry had been predicated on technology, guided by regulation, and driven by expansion into new markets; a company's success was largely determined by its ability to extend the geographic boundaries of its operations. The emphasis had been on securing new markets essentially through technological sophistication and financial might, but, as with monopolized industries before it, the telecommunications industry paid little attention to marketing toward specific types of customers or developing diversified services to suit the divergent needs of its clientele.

This was the direction Crowe and others saw the telecommunications industry moving toward after deregulation: a market reorganized around customers, spawning specialized market niches that addressed the specific needs of specific customers. Indeed, many of the characteristics that defined the industry before deregulation would continue to characterize it in its new competitive era. Technology and market expansion would continue to be the foundation from which growth and success would develop, but in a more competitive arena customer satisfaction and loyalty would play a much larger role in determining success in the industry.

With this perspective in mind, Kiewit Communications was organized to provide telecommunications services to specific clientele: large corporations and government agencies. In so doing, the company carved a niche in the broadly defined telecommunications market as a bypass provider of telecommunication services, generating revenue by enabling its customers to place long-distance telephone calls without going through the local telephone utility, thereby avoiding additional connection fees charged by the local utility.

Initially targeting financial institutions—large banks and investment firms—as the company's primary type of customer, Kiewit Communications began operating in 1988 with an emphasis on building its presence in its newly created market niche at the expense of short-term profits, structuring its growth around particular customer types located in particular metropolitan areas. Six years later, the company still had not recorded a profit, but prodigious growth had been recorded, as each metropolitan area added to the company's network increased its presence and influence in the U.S. telecommunications market and limited its capability to post any profit.

Chicago was the first city in which Kiewit Communications provided telecommunication services through a fiber-optic network, beginning in April 1988. By the end of the following year, seven more metropolitan areas were added, bringing Kiewit Communications ' revenues for the year to $397,000. Its net loss, however, approached $18 million, significantly more than the $2.9 million recorded as a loss the previous year, evidence that the company's initial intent was not to operate at a profit, but to establish itself as a long-term participant in the telecommunications market through rapid growth. This strategy was made possible by the financial support of its parent company, Peter Kiewit Sons ', and afforded Kiewit Communications an opportunity to grow more rapidly and pay less attention to the bottom line than other, newly emerging competitors.

Kiewit Communications focused on expansion, increasing the number of cities to which it provided long-distance and data transmission services to 12 by 1991—when Kiewit Communications became MFS Communications, Inc.—then to 14 the following year. In the course of this growth, the company's annual sales increased exponentially, rising from the $397,000 generated in 1989 to $10.6 million the following year, then soaring to $37.2 million by 1991 and $108 million in 1992. With robust revenue growth and market expansion, however, came further increases in MFS Communications ' net losses, which peaked at $30.9 million in 1990, then slid to $13.1 million by 1992. As these losses mounted and growth continued unabated, the company, still operating as a second tier subsidiary of Peter Kiewit Sons', began to look for additional ways to finance its growth. The most obvious solution involved a public underwriting of MFS and a separation from Peter Kiewit Sons ', which the company did the following year, in May 1993.

Once a publicly-held company, MFS Communications used the money raised from the sale of its stock—approximately $1 billion was realized in 1993 and early 1994—to begin marketing the company's services to a new class of customers: small and medium-sized businesses employing between five and 200 employees and using between one and 250 telephones. Before MFS Communications ' efforts toward entering this much larger and virtually untapped market materialized, the company unveiled a revolutionary telecommunications service in August 1993, when it built the first nationwide Asynchronous Transfer Mode (ATM) network, enabling customers to transmit voice, video, and data signals simultaneously through a single telephone or cable-television line. The company's establishment of nationwide ATM service evidenced its ability to offer more sophisticated telecommunication services than other much larger rivals, such as AT&T, MCI, and Sprint, without recording any profit, an ability that enabled the company to compete in a market dominated by wealthier competitors and provided a springboard for further market penetration.

The springboard provided by the establishment of an ATM network carried MFS Communications overseas the following month, when the company received a telecommunications license from the British government to build and operate a local fiber-optic network. Also utilizing an ATM network, the company's expansion overseas initially led to an agreement with roughly 70 business customers, primarily U.S. and U.K. multinational companies that MFS Communications had served in the United States, and established a base of operations for further European expansion. Entry into the United Kingdom, where telecommunication regulations were most permissible for such a foray, was also a suitable starting point because approximately 300 of the company's 800 business customers in the United States had operations in the United Kingdom. Building from this base, MFS Communications planned to

operate additional telecommunication networks in Frankfurt and Paris in the imminent future, then expand to other areas in Europe within the next several years, drawing on its established clientele in the United States and in the United Kingdom to fuel its international growth.

As the company was defining itself in its new era of operations after becoming a public company, two strategic objectives were readily apparent: international expansion and the development of a small and medium-sized business clientele. The former was being executed through the construction and operation of a fiber-optic network in England under the purview of a subsidiary company, MFS International, Inc., while the latter was being executed through another of the company's subsidiary units, MFS Intelenet, Inc. Although plans were developing for both of these objectives as the company effected the transition from operating as a subsidiary of Peter Kiewit Sons' to becoming a publicly-held corporation, neither materialized in any substantive form until 1994, when the company's transatlantic audio, data, and video service began and it purchased Centex Telemanagement Inc. in a bid to accelerate the introduction of its fiber-optic network services to small and medium-sized businesses.

A San Francisco-based telecommunications management company with 11,000 customers, Centex was among the first businesses in the United States to manage local and long-distance telecommunication services for smaller business, giving MFS Communications valuable assets, experience, and talent in a market it hoped to considerably strengthen its presence. In addition to the Centex acquisition, MFS Communications also constructed two new fiber-optic networks in 1994 in Phoenix and San Diego, further broadening its service area in the United States, which by mid-1994 comprised 31 U.S. metropolitan areas either serviced or under development by MFS Communications ' fiber-optic networks. Internationally, the company began offering telecommunication service in Frankfurt in July 1994, its first Continental European city of operation, and planned to begin offering service in Paris in September 1994. Positioned as such, the company entered the mid-1990s planning, as it had since its emergence in 1988, for further growth without expectations of posting a profit in the immediate future, but with considerable expectations of increasing its domestic and international presence.

Kiewit Enters Fiber Optics Joint Venture

OMAHA, Neb. (AP) — Peter Kiewit Sons' Inc., which is building a fiber optics network in the coal tunnels beneath downtown Chicago, has entered a joint venture to build similar networks in up to 10 other cities.

Kiewit Communications Co. Inc., a unit of the Omaha-based Peter Kiewit Sons' Inc., signed a letter of intent with Chicago Fiber Optic Corp. to build fiber optic telecommunication systems in up to 10 cities.

Philadelphia will be the first city, and nine more, including Omaha, are under consideration, officials said.

"We're interested in large organizations, companies with big telecommunications needs or unique requirements," said Anthony J. Pompliano Sr., president of Chicago Fiber Optic.

He said the system would be a competitive alternative to existing fiber optic communications systems.

Kiewit and Chicago Fiber Optic formed Metropolitan Fiber Systems Inc., a joint venture firm, to develop and operate the fiber optics systems. Kiewit and the majority owners of Chicago Fiber will jointly own Metropolitan Fiber.

Pompliano, also chief executive officer of Metropolitan Fiber, said he became acquainted with Kiewit when the firm started building a $12 million fiber optics network last July under Chicago's Loop in the city's business district.

"Kiewit built the fiber optics system using old abandoned coal tunnels that were build at the turn of the century," Pompliano said. "This is an ideal application for fiber optics."

In each new city, Metropolitan Fiber will form a subsidiary that will own and operate the fiber optics network.

The cost of each network will vary by city and could cost from $4 million to $12 million each, Pompliano said.

Centex stock surges after takeover bid by MFS

By Karen Padley
Bloomberg Business News

SAN FRANCISCO — Centex Telemanagement Inc., one of the first companies to manage local and long-distance telephone services for smaller businesses, saw its shares more than double yesterday after MFS Communications Co. offered to buy the company for $9 a share cash.

Centex stock gained $5.62½ to close at $10.50. More than 12.6 million of the 17.7 million shares outstanding changed hands, making it the most active Nasdaq issue.

MFS Communications, based in Omaha, Neb., announced its offer late Tuesday, saying it had been rebuffed by Centex's board. It already owns 8.4 percent of Centex stock.

Centex said yesterday it is considering the offer and will respond within the next 10 business days.

Analysts applauded the proposed merger, saying it would be a good fit. Both offer similar products for small and medium-sized businesses, although MFS Communications depends more heavily on networks and Centex on services.

A possible 'coup'

MFS Communications stock closed up $4.37½ at $35.12½. Volume was 1.45 million shares, almost three times the three-month daily average.

"If they get Centex, it will be a coup for them," said Ronald Altman, an analyst with Furman Selz, New York. "The combination makes an enormous amount of sense as competition increases in the local markets."

MFS was spun off in May 1993 from Kiewit Diversified Group Inc., a unit of closely held Peter Kiewit Sons' Inc. It benefited from a September 1992 ruling by the Federal Communications Commission that opened local telephone service to competition, ending the monopoly enjoyed by regional telephone systems.

The company lost $16 million, or 30 cents a share, in 1993. It is expected to keep losing money as it builds fiber optic networks in 65 cities over the next three to five years.

"MFS is making significant capital improvements in those networks so the more they add customers, the quicker they reach profitability," said Jacqueline Popp, a Duff & Phelps Corp. analyst.

Altman said two thirds of Centex's 11,000 customers are located in California, which would give MFS the kind of scope and scale it will need.

"This will accelerate MFS' move toward profitability," Altman said. He estimates MFS with Centex could break even by the end of 1996 instead of late 1998.

$5.1 million reserve

Centex, founded in 1983, has been publicly traded since 1987. It provides local, long-distance, conference calling, voice mail and other services for small to medium-sized businesses. It does not provide long-distance service directly, as MFS does, but uses various carriers.

The company set aside a $5.1 million reserve in the fourth quarter to restructure its operations, accelerate sales and improve efficiency. Centex last week laid off 18 people from its headquarters.

1996 (May 06) - Baltimore Sun - $189 million bonanza on lucky venture MFS' takeover of UUNET to benefit local firm's clients; Humbled and looking ahead; At NEA it's 'thank God and we're on to the next dream'

Timothy J. Mullaney ; Source : [HN01CS][GDrive]

Of all the beneficiaries of last week's $2 billion deal for MFS Communications Co. to take over Internet access provider [UUNET Technologies, Incorporated], one of the biggest will be a Baltimore venture capital firm that stands to make $189 million on a $4 million investment.

New Enterprise Associates controlled 10.1 percent of Fairfax, Va.-based Uunet, having paid $3.9 million for the stake in 1994. NEA endured a wild roller-coaster ride in Uunet's stock price after the company went public last May, and stands to make a killing for its clients when the merger goes through. [...]

The 18-year-old firm has invested in about 320 companies, which [NEA general partner Charles W. Newhall III] said have $18 billion in annual revenues. NEA has capitalized on the historic bull market for new stock issues that has made millionaires out of people who founded NEA-backed companies such as Genetic Therapy Inc. of Gaithersburg and Integrated Health Systems Inc. of Owings Mills.

In most cases, venture capitalists get paid when a company is sold or goes public. NEA's 15 initial public offerings last year topped the venture capital industry for the third time in four years, according to a report by San Francisco-based Venture-One Corp.

"Over the last five years, NEA has averaged one IPO a month -- a remarkable track record for an entrepreneurial money machine," Venture-One said.

Not nearly all the cash from the [UUNET Technologies, Incorporated] takeover will go to NEA's principals, however. The investment was made with part of a $200 million fund the firm raised from pension funds and other investors in the early 1990s, Newhall said. NEA principals put up 1 percent, and otherwise get paid a share of the profits above the $200 million invested. Given the hit on Uunet, almost any return at all on the other $196 million in the pool is pure profit. [...]

[UUNET Technologies, Incorporated] founder **Richard Adams** was basically an engineer with a vision when he went looking for money in 1994. He met up with NEA, and with two other venture firms, and quickly raised the money he needed to move forward.

But it came with a price. The venture capitalists decided that [UUNET Technologies, Incorporated] needed upgraded management. "They said, basically, we're going to hire a management team and we're going to put some money in," said **Uunet President and Chief Executive [John William Sidgmore (born 1951)]**. "They brought people in in early '94."

[John William Sidgmore (born 1951)], **a colleague of NEA partner Peter Barris when they both worked for General Electric Co.**, was at the top of the list. **He had sold Intelecom Solutions, a Montgomery County software firm, to Computer Sciences Corp. in 1991 and was still running Intelecom for the new owner when Barris approached him.**

"He basically convinced me this would be an exciting area to work in," Sidgmore said. "It was a little tiny company, much smaller than the one I was running. But Peter convinced me it was a terrific opportunity." [...] Sidgmore said. "No, of course [I didn't know how terrific the opportunity was, ...] but you have to remember no one knew anything about the Internet two years ago. Now everyone thinks they're an expert."

What happened in between was 1995. [UUNET Technologies, Incorporated] did some big things right, and also rode a wave of interest in the Internet that was mostly beyond its control.

On its own, UUNET decided to focus on the business market, avoiding low-margin competition with the likes of America Online for consumers' business. And it made a key alliance with software titan Microsoft Corp., which took a 13 percent stake in Uunet.

"Microsoft, in essence, financed development of the network," [John William Sidgmore (born 1951)] said.

By then, the media had joined the Internet hype, and so had the stock market. And, Sidgmore says, there was good reason.

"People realized the Internet would become a revolutionary technology," he said. "It enables virtually everyone to communicate with each other, and it was dramatically cheaper than conventional networks. These two things were a sea change."

The wave allowed [UUNET Technologies, Incorporated] to go public at $47 a share last May. From then it was a roller-coaster, with the stock rocketing above $70, then plummeting as low as $24.50 after AT&T; Corp. said it was getting into the Internet access business, then rebounding as optimists comforted themselves with the idea that upstart AT&T; challengers past have grown into companies like MCI Communications Corp.

The takeover price was $61 a share. But the deal attracted negative attention as well, because suspicious trading in Uunet options made it appear news of the deal had leaked prematurely. Sidgmore said the company doesn't know who bought the options before the deal.

"A lot of communications technologies have come and gone, and AT&T; hasn't dominated them," Newhall said. "We felt that if you went into the business end of the Internet backbone, you could add products and services to be competitive."

But Sidgmore said the company made the deal because moves like AT&T;'s entry make the Internet business much more competitive.

The Virginia company simply needed a bigger partner with deeper pockets to make the technology investments Uunet will need to keep up.

"The Internet is getting very serious, and there are going to be a lot of very serious players," he said. "If we want to remain a leader, we were not going to be able to do it on our own."

Newhall said NEA's 16 investment professionals, based on St. Paul Street and in Silicon Valley, live by their ability to spot trends, mostly in health care and information technology industries. "In our business, our success is determined by our ability to participate in things that change the way the world is," he said. "I think we've done that."

"We've basically succeeded in what we dreamed of doing: starting businesses that are important."

1996 (Aug 27) - NYTimes : "Worldcom to Buy MFS for $12 Billion, Creating a Phone Giant"

By Mark Landler ; Source : [HN01CQ][GDrive]

In a sign of the rush toward "one-stop shopping" in telephone service, [WorldCom Corporation] agreed to buy MFS Communications yesterday in a stock

In a sign of the rush toward "one-stop shopping" in telephone service, [WorldCom Corporation] agreed to buy MFS Communications yesterday in a stock deal worth approximately **$12 billion**.

The combination of Worldcom and MFS creates the nation's first fully integrated local and long-distance phone company since the breakup of the Bell System in 1984. And though the companies are hardly household names, together they promise to be a new giant in the lucrative market of providing communications services to business customers.

By combining networks, MFS Worldcom will be able to offer corporate customers a full complement of services: local and long-distance phone, data transmission and access to the Internet. Worldcom, the fourth-largest long-distance carrier, has until now primarily sold its network capacity to other long-distance companies. MFS is the leading provider of alternative local phone services to business customers seeking better prices or services than are available from the local telephone monopolies.

For all its size, however, yesterday's merger is only the third-largest deal of the year in the roiling telecommunications industry, outranked by the $22.1 billion combination of Bell Atlantic and Nynex and the $16 billion merger of SBC Communications and Pacific Telesis.

And unlike those pending mergers, yesterday's deal will have scant impact on residential customers. Worldcom and MFS plan to focus almost exclusively on the business market, where for years big corporate customers have purchased phone service from carriers that lacked such familiar brand names as AT&T or Nynex.

Still, analysts and executives said the merger was another milestone in the redrawing of the communications landscape that began when the Government deregulated the industry in February.

"It's highly significant because it elevates one more player into the ranks of end-to-end service providers," said Paul T. Unger, a telecommunications consultant at A. T. Kearney.

Together, MFS and Worldcom will have $5.4 billion in revenues, operations in 45 domestic markets and 500,000 corporate customers. Worldcom will issue 500 million to 550 million shares to acquire MFS.

In Nasdaq trading yesterday, Worldcom's stock dropped $3.625, to $22.75, while **MFS jumped $9.94, to $44.81**.

MFS Worldcom faces plenty of competition in the business market. AT&T, MCI and Sprint are moving rapidly to offer packages of services to corporate customers. And the Baby Bells intend to be full-service providers as well, though they will cater primarily to businesses in their own regions.

Several analysts said the merger presaged even more deals, and they pointed to another alternative local-access provider, the Teleport Communications Group, as the next potential takeover. Teleport announced a deal with AT&T yesterday to carry long-distance calls by connecting its local networks in large cities to AT&T's nationwide network. Teleport's shares rose $1.375, to $23.625.

Neither MFS nor [WorldCom Corporation] is a stranger to mergers. MFS, which is based in Omaha, acquired a leading Internet access company, [UUNET Technologies, Incorporated], for $2 billion in April. And Worldcom, which is based in Jackson, Miss., was cobbled together from several small long-distance companies, reaching its current configuration through the $2.5 billion joining of LDDS and Wiltel Network Services in January 1995.

Analysts generally praised the latest deal, which was reported yesterday in The Wall Street Journal, though some noted Worldcom was paying a lofty premium. Under the terms of the deal, each share of MFS common stock will be exchanged for 2.5 shares of Worldcom stock. Based on yesterday's closing price, that values MFS shares at $47.80 each -- a 37 percent premium to the market value on Friday.

MFS, which has invested heavily to build fiber optic networks, had revenues of $583.2 million in 1995, but lost $267.9 million. "You're paying $12 billion for a company with negative net income and negative cash flow," said one analyst, who insisted on anonymity.

That prospect apparently does not daunt Bernard J. Ebbers, the president and chief executive of Worldcom, who proposed the merger to the chairman of MFS, [James Quell Crowe (born 1949)], over dinner two weeks ago at Mr. Crowe's home in Omaha. The two men took barely two weeks to hammer out a deal the size of Time Inc.'s 1990 acquisition of Warner Communications.

Mr. Ebbers, whose flowing hair and relaxed manner make him look more like a country-and-western singer than a corporate executive, will be the chief executive of the new company. [James Quell Crowe (born 1949)] will be the chairman.

Worldcom's current chairman is John W. Kluge, the billionaire investor and a major shareholder in the company. Mr. Ebbers said Mr. Kluge would step down when the merger is completed in four to eight months. He said it was not clear whether Mr. Kluge would remain on the board.

Mr. Ebbers said the companies did not plan any layoffs. But the merger will probably claim at least one casualty in the executive suite. Royce W. Holland, the president and chief operating officer of MFS and one of its founders, said he would probably depart in a few months.

"I've been at this for nine years," Mr. Holland said yesterday, "It's probably time for me to take a little time off."

In a joint interview, Mr. Ebbers and Mr. Crowe said the merger would give them a critical jump over AT&T, MCI and other rivals in offering a bundle of services to business customers.

Worldcom owns a fiber optic backbone that snakes around the country, while MFS has scores of smaller fiber optic rings in local markets. By connecting the companies' combined 25,000 miles of fiber, the two executives said they would be able to carry traffic entirely on their own networks.

"Being first to market is a tremendous advantage, because building these networks is not an overnight proposition," Mr. Ebbers said.

AT&T, MCI and Sprint do not own local systems. So as they move into the local phone business they must either lease capacity from the Baby Bells, or construct their own local switches and networks. The Baby Bells, meanwhile, are prevented from entering the long-distance business until they can demonstrate that their local markets are truly competitive.

Combining Worldcom and MFS will also squeeze savings out of both companies. Daniel Reingold, an analyst at Merrill Lynch & Company, estimated that MFS would save about $40 million a year by diverting its long-distance traffic from AT&T and other carriers to Worldcom's network. And Worldcom could save $200 million to $400 million in access charges by using MFS's local networks to connect calls from its long-distance customers.

Worldcom has racked up an impressive annual return to shareholders of 57.3 percent in the last decade -- in part by aggressively acquiring and managing other telephone companies.

"They've shown an ability to integrate acquisitions," said Simon Flannery, a telecommunications analyst at J. P. Morgan & Company, "It's important to look at their track record in analyzing this deal."

Whatever Mr. Ebbers's talents as a manager, some observers question whether he needed to buy MFS -- particularly given the $12 billion price tag. With fiber optics and digital technology expanding the capacity of telephone wires, some analysts forecast an eventual glut of network circuits that will probably enable long-distance carriers to lease capacity on local networks at increasingly favorable rates.

P. William Bane, a telecommunications consultant at Mercer Management Consulting in Washington, said Worldcom might have been able to get into the local phone business simply by leasing capacity on the local networks of the seven Baby Bells.

Indeed, MCI Communications announced something resembling such a deal yesterday with Nextwave Communications, a company that plans to offer a new type of local cellular service, called personal communications services. MCI will lease capacity on Nextwave's wireless system and sell it under the MCI brand name.

"If they can fill in all the pieces, they'll do very well," Mr. Bane said of MCI. "And they won't have to buy anything."

2001 (June 18) - WSJ - "How the Fiber Barons Plunged The U.S. Into a Telecom Glut"

By Rebecca BlumensteinStaff Reporter of The Wall Street Journal; June 18, 2001 1:03 pm ET

Source : [HN01CP][GDrive]

DENVER -- As he rushed to lace America with fiber-optic cable, James Crowe wasn't the sort to let anything stand in his way -- not the Rocky Mountains and certainly not his crosstown rival, Joseph Nacchio.

By 1999, when Mr. Crowe's [**Level 3 Communications, Incorporated**] started digging a line connecting Denver and Salt Lake City, Mr. Nacchio's Qwest Communications International Inc. had already threaded its own cable through the most direct route, a seven-mile railway passage through the granite of the Continental Divide. Undeterred, Level 3 swerved an extra 70 miles through southern Wyoming, installing fiber at a blistering 19-mile-per-day pace.

But now, Level 3 has hit a wall even Mr. Crowe may have trouble overcoming. The company's original ambition -- to build history's largest, most advanced fiber-optic network to carry exploding amounts of Internet traffic -- is now part of one of the biggest gluts the country has ever seen.

All told, about 39 million miles of fiber-optic cable stretch underneath U.S. railroad beds, corn fields, natural-gas lines and roads, enough to circle the earth 1,566 times. Companies racing to build or expand nationwide networks laid some $90 billion of fiber during the past four years. Merrill Lynch & Co. estimates that only 2.6% of the capacity is actually in use. Much of it may remain dark forever.

The fiber glut underlies much of the uncertainty plaguing the telecom sector -- and has even spilled over into the economy at large. Billions of dollars in shareholder value have evaporated in some of the biggest owners of fiber networks, including Global Crossing Ltd. ,Williams Communications Group Inc. and Genuity Inc. Many are struggling with massive debt: On Friday, 360networks Inc. said it was delaying a $10.9 million interest payment while it studies ways to preserve cash (see article).

The carnage has spread to suppliers such as fiber-maker Corning Inc. and Lucent Technologies Inc. Also on Friday, Nortel Networks Corp. , which makes gear for the Internet and telecom sectors, predicted a staggering $19.2 billion loss for the second quarter (see article).

Level 3, meanwhile, is fast retrenching. Its stock is off 94% from its high, and executives are expected Monday to announce plans to lay off as much as 20% of the work force, among other cost-cutting moves. The company's game plan: live off its stockpile of cash -- some of it raised from Omaha construction magnate Walter Scott Jr., a close friend of investor Warren Buffett -- until competitors die off and demand returns.

"The shake-out that is occurring is good for Level 3 in the long term, although it is awfully hard to convince someone who is sitting in a dentist's chair being drilled that this is a good thing," says Mr. Crowe. "It hurts."

Level 3's troubles represent an even bigger threat to the economy than the first round of the dot-com meltdown because the telecom companies involved are so much bigger. As a group, telecoms have gorged on some $650 billion in debt and are now failing in record numbers for the industry. The debacle is shaping up to be one of the biggest financial fiascoes ever, with losses to investors expected to approach the $150 billion government cleanup of the savings-and-loan industry a decade ago. And as more companies recognize the depth of their problems, the damage is likely to get worse.

To understand the origins of the mess, it helps to take a close look at two of the industry's pioneers, Qwest and Level 3. Located just miles apart in the Rocky Mountain foothills, each sprang from the ambitions of an old-style Western billionaire. Each dazzled investors early on with visions of rapidly expanding demand for telecommunications bandwidth, only to run into difficulties when Internet usage didn't soar as expected. But in the end, only one of the companies would figure out a way to shelter itself against the coming storm.

It has been said that the fiber glut bears a striking resemblance to the overbuilding of the railroads in the late 1800s. So perhaps it's fitting that one of the first to launch a nationwide network to compete with the long-distance companies was **Philip Anschutz**, a Denver railroad and mining baron whose net worth last year was put by Forbes Magazine at $18 billion.

By the mid-1990s, when Mr. Anschutz turned his attention to the industry, most of the nation's fiber was owned by AT&T Corp. , Sprint Corp. and MCI, along with a few upstarts. The hair-thin strands of superclear glass carry infrared light generated by tiny lasers that blink on and off billions of times per second, in a code that transmits voice calls or data traffic. Fiber dramatically increased the number of calls that could be handled at one time, making it far cheaper to use than coaxial cable, which is made of copper wire encased in plastic and aluminum.

Mr. Anschutz first became intrigued with the business through his ownership of Southern Pacific Rail Corp., which had a construction subsidiary that installed fiber along railroad tracks for other customers. When he sold Southern Pacific to Union Pacific Corp. in 1996, he retained the subsidiary, SP Telecom.

Laying fiber isn't technically difficult. Networks are built by burying plastic pipes, or conduits, in the ground and then literally blowing the fibers through with compressed air. One recurring problem is obtaining the right-of-way from property owners. It was there that Mr. Anschutz seized on his advantage: SP Telecom was already armed with the go-ahead to build along much of the nation's railroad tracks. He decided to build a newfangled network specifically designed to carry increasing amounts of data traffic -- with the goal of renting space to other telecommunications companies that needed long-distance capacity. In industry lingo, he would become a carrier's carrier.

Mr. Anschutz called the company Qwest and in January 1997 hired Mr. Nacchio, an engineer by training who was then head of AT&T's huge consumer unit, to bring it public. A compulsive workaholic who once finished the New York City marathon with a badly bleeding foot, the 51-year-old Mr. Nacchio left his family in New Jersey and commuted to the Denver headquarters, routinely working until 11 at night.

When Mr. Nacchio took over Qwest, he immediately bumped up the plan to build a 13,000-mile U.S. network to 18,500 miles. It looked like a financial stretch at first. Qwest had $150 million in seed money from Mr. Anschutz, but the rest came slowly. After a two-week road show in March 1997, Mr. Nacchio secured $300 million in debt at a relatively stiff 11.875% interest rate. Three months later, Qwest went public, raising $318 million.

But before long, business took off. As one of the first entrants to the market, Qwest was able to reel in some early telecom clients. GTE Corp., Frontier Corp. and WorldCom Inc. bought about half the fibers on Qwest's network for about $3.6 billion, enough to cover about 90% of the cost of building its entire network. Within six months, Qwest's stock price had doubled.

The success wasn't lost on one of Qwest's board members, a telecom visionary in his own right named Jim Crowe. A former WorldCom chairman, Mr. Crowe was fixed for life financially and testing out retirement.

But he was growing antsy and wanted back in the game. He had long toyed with the idea of setting up a long-distance fiber network himself. And he had a billionaire of his own to back him up: Mr. Scott, his former boss at Peter Kiewit & Sons, the closely held Omaha construction giant.

Mr. Scott was receptive to the idea. At a 1995 gathering in Ireland of executives close to Mr. Buffett, Mr. Scott had been dazzled by a talk by Bill Gates. The Microsoft Corp. chairman told the audience that the Internet "was radically going to change the world," Mr. Scott recalls. And Mr. Crowe already had a stellar track record: A few years earlier, he had built a Kiewit telecom spin-off, MFS Communications, and sold it to WorldCom for $14 billion.

So in 1997, Mr. Crowe told Mr. Anschutz that he was planning to leave the Qwest board at the end of the year. "I said that I might start a company and it might be competitive," says Mr. Crowe.

The move, when it came, caught Mr. Nacchio by surprise. He says he knew Mr. Crowe was drumming up a plan but believed he would focus on the local-phone business. "Jim asked me, 'What is the best place to locate a company?' I said Denver," says Mr. Nacchio. "I didn't know he was going to be a direct competitor. If I'd known that, I would have said Pennsylvania."

Mr. Crowe started Level 3 with $3 billion from Kiewit and a select group of investors, including Mr. Scott, who became Level 3's chairman. Instead of having an IPO, Level 3 simply took over a tracking stock held by Kiewit and was listed on the Nasdaq in April of 1998. He located the company in Broomfield -- just 14 miles from Qwest's Denver headquarters -- a spot Mr. Crowe says he picked after a national study about where high-tech talent wanted to live.

The 51-year-old Mr. Crowe, an imposing figure who could pass for a high-school football coach, started with plans for an ambitious global network. He broke ground for a 16,000-mile U.S. route in Schulenberg, Texas, in July 1998, and then drew up plans for a 4,750-mile network in Europe. Tapping an Omaha connection, Union Pacific head Richard Davidson, Mr. Crowe got permission to build on the railroad's lines for some of its routes. Before long, the company was working in 20 different time zones, with 250 crews digging at once in North America alone.

The Sniping Begins

The sniping between Qwest and Level 3 started almost immediately. A clearly hurt Mr. Nacchio groused that Mr. Crowe was pursuing a "copycat strategy" and openly wondered whether his rival had unfairly gained insights during his time on the Qwest board. "At the end of the day, I have always questioned why he would join," he says. "I'll bet you he learned something being on our board."

Mr. Crowe, who insists he was up-front at all times with Messrs. Anschutz and Nacchio, retorted that Level 3's network would be a technological leap beyond Qwest's. Level 3's innovation was to lay 12 conduits in each leg of the network, against Qwest's two. Only one might have any fiber blown through it at first, with the rest to come as demand warranted. Since one of the biggest costs in laying networks was the digging, Level 3 figured it could save money in the long run by doing it just once. It would also be able to adapt quickly as new kinds of fiber became available.

"Qwest is a fine company and I like Joe. However, we have a big disagreement," says Mr. Crowe. "Our goal is not simply to deploy one generation but to build an entirely new model that assumes technology will change quickly, and at times, unpredictably."

Mr. Crowe quickly attracted an almost cult-like following with his theories of how the Internet would revolutionize the stodgy world of communications. One of his best-known principles, and one of the main reasons he built such a large network, was known as disruptive pricing -- using low prices to stimulate Internet demand. "For every one percent you drop price, you get a greater than one percent increase in demand," Mr. Crowe said again and again.

He also had little patience for vertically integrated companies that try to do it all. Instead, he argued, communications would eventually drift toward a high-tech model, where each of the most successful companies carves out its own niche.

Investors ate it up, especially in Omaha, where the Peter Kiewit name was legend. Generations of engineers had already become wealthy through an employee stock ownership plan, and when Level 3 was spun off, the workers' paper profits soared. The fact that Mr. Scott sits on the board of Berkshire Hathaway Inc., and Berkshire's legendary leader, Mr. Buffett, keeps his offices on the 14th floor of Kiewit Plaza, only added to the allure. "A lot of people thought this was the next coming, the next Berkshire Hathaway. They loaded all their assets in," says Marc LeFebvre, a stock broker in the Omaha office of Dain Rauscher Inc. who, along with his father, once worked at Kiewit.

By February 2001, Level 3 had managed to raise $13 billion, enough to finance building its entire network and -- according to its plans -- keep it going until it achieved profitability. Derek Scarth, an equity analyst with Berger Funds, remembers Mr. Crowe's pitch boiled down to this: "If you build it, they will come."

But it wasn't customers who came so much as it was competitors, lured by the easy availability of funding. J.P. Morgan and McKinsey & Co. figure at least 50 companies, offering a range of Internet backbone services, joined the gold rush by the end of 2000.

"There was a time in 1998 and 1999 where we were getting five offerings a week, just in telecom," says Brian Hayward, head of telecom investing for

Invesco Capital Management Inc. The pile of prospectuses on his floor was two feet high.

Mr. Nacchio marvels at how easily the money flowed. In the fall of 1998, he remembers coming up with a second round of financing in a 10-minute call with bankers while driving to his son's soccer game. "Before the game was over, we had subscribed for a billion bucks at 8.9% interest," says Mr. Nacchio. "To me, we had arrived."

Once the big dig was set in motion, it was hard for any one player to scale back. Each had raised money by promising investors a new fiber-optic network, and each felt compelled to forge ahead to get revenue flowing as soon as possible. Mr. Crowe, who watched competitors creep up behind him much as he had crept up on Qwest, consoled himself with the conviction that his network would be superior. And he and all the others stood firm in the belief that Internet traffic -- whether e-mail, or pay-per-view movies or the frenetic transactions of day traders -- would soon be gushing so fast that it would engulf all their pipelines and more.

Major Miscalculations

In retrospect, the executives -- and Wall Street -- made some major miscalculations. Too many companies focused on the easy part of building a network: the long-distance loops that cut mostly through rural areas. Too little money went into widening the pipes that run into homes and offices, an extremely expensive undertaking complicated by the fact that the Baby Bells already own such "last-mile" connections. With high-speed access slow to reach businesses and consumers, development of the sort of "killer applications" that might spur new usage dwindled.

Some analysts tried to sound a warning. In October 1998, an Internet researcher at AT&T Labs named Andrew M. Odlyzko published a paper debunking the widely held view that Internet traffic was doubling every three months. Mr. Odlyzko laid out an argument that in fact Internet use was doubling only once a year. "It was an extremely convenient myth," says Mr. Odlyzko. "Every entrepreneur who was getting financing could quote it."

With the flood of investment money continuing unabated, few in the business paid him any heed. But Mr. Nacchio was starting to get rattled. With so many new entrants, he figured, life as a carrier's carrier might get tough. The entire wholesale market, Mr. Nacchio calculated, was roughly $9 billion a year. "There wasn't enough revenue to go around," he says. So Mr. Nacchio began converting Qwest into a retail company instead, acquiring LCI Communications, which made Qwest into the nation's fourth-largest long-distance company.

In June 1999, he dropped a bombshell by making a bid for U S West, the Denver-based Baby Bell. Coming as it did in the midst of America's Internet euphoria, the move stunned investors, who wondered why Qwest would buy such a traditional, slow-growing company. Mr. Nacchio even had trouble persuading Mr. Anschutz that the move was justified. "All I knew is that we were not going to succeed by being a one-trick pony," says Mr. Nacchio.

Whatever the justification, the stock market wasn't buying it. Qwest's shares plunged, but the $35 billion deal still went through. Mr. Crowe, for the time being, was looking brilliant. Level 3 stock surpassed $130 per share in March 2000. Dangling fat stock options, Level 3 poached Qwest employees, sometimes driving Mr. Nacchio to distraction.

Even though Level 3 was still more than a year away from completing its network, it managed to grab headlines. In October 1999, the company snagged a key piece of America Online's business from WorldCom. Analysts estimated that Level 3 undercut WorldCom's price by 50%. Mr. Crowe's theory of disruptive pricing was having an impact.

But Mr. Nacchio had some disruptions of his own in mind. Angered by the defections and worried about market share, the executive ordered his sales teams not to lose any contracts to competitors. The project, code-named "Operation Clean Sweep," turned the tide back in Qwest's favor.

It also kicked off a deflationary spiral the likes of which few industries have ever seen. In the wholesale market -- the business of selling network space to other phone and Internet companies -- prices are expected to plunge at least 60% this year.

It's even worse for so-called "dark fiber," which hasn't yet been connected to the expensive electronic equipment needed to make it usable. A major brokerage house, say, that wanted to purchase its own strand of fiber could pick it up for $1,200 a mile, down from as much as $5,000 in 1997, according to Qwest.

Such sales are becoming increasingly rare, however, because few companies are in a position to invest in the equipment needed to connect the fiber into a network. That equipment, including the ultra-fast switches called routers, costs many times more than the fiber itself.

The pricing collapse, combined with the bursting of the Internet bubble, has left the fiber industry gasping for air -- and Mr. Nacchio looking like a genius.

Saved by the Baby Bell

Thanks to the constant trickle of money from plain-vanilla local phone service, Qwest is projecting revenue of as much as $21.7 billion this year, up from $19 billion in 2000. It lost $81 million last year and won't be profitable anytime soon, but its stock price has been holding steady lately at around $33 on the New York Stock Exchange. That's down 48% from its high but still well above the initial offering price, adjusted for a split, of $5.50.

Life isn't so easy for Mr. Crowe. After trading as high as $130 in March of last year, the company's stock closed Friday on the Nasdaq Stock Market at $7.62, off 34 cents, or 4.3%. By some estimates, investors in the Omaha area alone have suffered paper losses of as much as $20 billion, leading to plenty of grumbling around town.

Tom Dowd, an Omaha attorney, is kicking himself for not selling his Level 3 shares earlier, but he still has faith the situation will improve. "Walter Scott has his reputation on the line with all these people getting it in the teeth," he says. "He doesn't want his legacy to be a foul ball."

It will take some doing to turn Level 3 back into a hit. Due to some environmental problems in California -- the digging was disrupted temporarily by regulators when a trout turned up dead near the route -- the network isn't quite finished. Of the 96 fibers in Level 3's first conduit, only two are currently lit.

And, despite winning high-profile customers such as Yahoo Inc. and XO CommunicationsInc., Level 3 recently lowered its projection of communications revenue for this year to as little as $1.4 billion from $1.7 billion. In 2000, the company reported a net loss of $1.45 billion on revenue of $1.18 billion, including $200 million in revenue from mining operations.

Some acquaintances have noticed that Mr. Crowe seems more subdued these days. But in public the executive remains the picture of confidence. He stresses that the company still has $4 billion in cash and says it will emerge from the shakeout.

"A year ago we were in a hothouse environment where every plant, regardless of its strength, prospered," he says. "Now, we are outside in the cold world. It is a better environment, as painful as it is."

2017 (Mar 14) - Level 3, which started with hopes of riches but ended with big losses for most shareholders, will cease to exist

See [HN01CT][GDrive] / Mar 14, 2017 Updated Aug 21, 2019

Thomas Dowd and hundreds of other Omahans soon will be digging out their Level 3 Communications Inc. stock records.

The reason: This week [in March of 2014], Level 3 shareholders are voting to sell the company to CenturyLink Communications.

The sale marks the end of an investment saga that began 20 years ago with hopes of riches but ended with big losses for most shareholders, despite the efforts of some of Omaha's biggest names in business.

"It was a very bad experience," said Dowd, a retired attorney and former director of the Metropolitan Utilities District. "It's just one purchase at a time, and you think everything's going good and then, bam! Anyway, lesson learned."

Although his loss was "substantial," he said, it didn't disrupt his lifestyle, and he figures he's better off than shareholders who lost their retirement savings or other vital funds. He's still a Level 3 shareholder and will get some cash and CenturyLink shares in the sale, which is scheduled for September.

But it works out to about $4.43 for shares he bought years ago, some of them costing more than $100.

It all started in the 1990s with the best of intentions, plus the admiration Omahans have for Peter Kiewit Sons' Inc., the Omaha construction and mining company, along with its then-chairman and chief executive, Walter Scott.

Along the way, Scott's friend and business associate Warren Buffett also gave an endorsement of Level 3. His Berkshire Hathaway Inc. invested $100 million in the company for a brief time.

In 2002 Buffett issued a statement that expressed confidence in Level 3's management, finances and "valuable assets" and added: "Level 3 is well-equipped to seize important opportunities that are likely to develop in the communications industry."

Level 3 started within a Kiewit division called Kiewit Diversified Group in 1990, eventually carving out its own shares of stock available to Kiewit employees. Unlike their shares in Kiewit's construction business, Kiewit Diversified shares could be sold publicly. Sales started showing up on informal trading sheets.

"All of the old Kiewit people were in it," said Jon Bischof, who retired in 1992 as a district construction manager for Kiewit. "It was really a hell of a deal. It was all very forward-thinking."

Under Kiewit executive [**James Quell Crowe (born 1949)**], Level 3 began building a fiber-optic highway for the upcoming information age. It was a marriage of high-tech fiber technology and Kiewit's time-tested construction skills, starting with $2 billion of Kiewit's cash. Scott became Level 3's first chairman, a position he held into 2014.

For Omahans, the risks of investing in an untested industry were clouded by the reputations of those involved and the logic of a fiber-optic network to serve the fledgling Internet revolution.

Omaha financial adviser Cella Quinn, who was specializing in mutual funds and advising against single-stock investments at the time, remembers the rush to buy Level 3 shares. Even Omaha mayors Hal Daub and Mike Fahey were Level 3 shareholders at one time.

"There was all this pent-up enthusiasm for anything Kiewit," Quinn said, because of Kiewit's well-known business success and the fact that only employees could own its stock. Average investors could only watch while Kiewit earned profits from work such as building Interstate highways and mining Wyoming coal.

On April 1, 1998, Level 3 shares began trading on the Nasdaq exchange, raising capital toward building the fiber-optic network.

"It was not only a Kiewit company, it was a Walter Scott company, too," Quinn said. "The man and woman on the street were looking at people who were involved in it who had become wealthy in private business. It was a way for the little guy to share in that."

Crowe and many other top Level 3 officers were alumni of MFS Communications Co. of Omaha, created within Kiewit as an early challenger to the newly separated Bell System companies. MFS was purchased by WorldCom Inc. in 1996.

Crowe served briefly as WorldCom chairman and then returned to Kiewit to form the fiber-optic operation that became Level 3. Scott served briefly on WorldCom's board of directors.

WorldCom filed for bankruptcy in 2002 after an improper auditing scandal that resulted in former CEO Bernard Ebbers being sentenced to 25 years in prison. Scott and Crowe were not implicated in the WorldCom case.

Although Level 3 moved its headquarters to Broomfield, Colorado, in 1998 to attract needed tech workers, some employees and a majority of its individual stockholders were in Omaha. It held annual shareholders meetings in Omaha through 2005.

On March 20, 2000, someone sold and someone bought Level 3 shares for $132.25, a price that made the company's publicly traded stock worth nearly $20 billion. By 2002, the price had nearly collapsed, putting most shareholders into the red.

Level 3 might have an information highway, but its toll system wasn't collecting enough to earn a profit. It was clear that the nation had a "bandwidth glut," a huge overcapacity of fiber networks.

Level 3 had installed its network, at an eventual cost of $14 billion, and could cheaply add more lines by stringing extra cable through its conduits.

But others had built networks, too, and the demand for bandwidth wasn't growing as Crowe had hoped. Researchers also found ways to send more data along existing fibers, meaning greater capacity along existing lines.

Most of the new fiber networks were unused, or "dark." Only a fraction of fibers in the buried bundles were "lit" by the light waves that carried digital communications and brought in revenue for companies like Level 3.

The supply of fiber far outran the demand, and Level 3's losses mounted, along with its stock price. Investors lost confidence that the company would begin making profits anytime soon. In fact, that didn't happen until 2014.

Local investors were encouraged by Berkshire's 2002 investment, accompanied by investment groups Legg Mason Inc. ($100 million) and Longleaf Partners Funds ($300 million). Berkshire and the two investment groups received bonds that they later converted into common stock. But the next year, Berkshire sold most of those shares.

It was a case of stock prices reflecting what investors would pay, rather than the value of the company — in short, speculating.

By late 2008, the stock price hit bottom at 60 cents a share, or a total value of about $80 million. Level 3 was losing more than that every three months, but had a healthy supply of capital from Kiewit to keep operating.

Quinn, the financial adviser, said investors had been reluctant to sell their Level 3 shares as the price went up because they didn't want to pay income taxes on their profits and because they believed the price would go higher.

Many of them also didn't sell when the price went down, either, thinking it would recover. **They couldn't imagine Kiewit, Scott and Buffett would back a loser.**

"One of the lessons to be learned is that falling in love with a local stock doesn't guarantee that you're going to make money," Quinn said. "So many people knew people who were affiliated with Level 3 through Kiewit or elsewhere that it was very difficult for them to realize that they would lose."

In recent years, Level 3's stock price rallied somewhat, but only after a 1-for-15 reverse stock split kept its shares in mutual funds and other institutional portfolios. Its operating results improved.

Kiewit, Buffett and Scott declined to comment for this story, but Scott spoke at Level 3's 2014 shareholder meeting, when he stepped down as chairman. (He was succeeded by James Ellis, who as a Navy admiral had commanded the U.S. Strategic Command in Omaha before retiring in 2005. Crowe retired as CEO at the end of 2013.)

"I wanted to stick around until I was convinced that Level 3 was solidly on a path toward its destiny," Scott told the shareholders, according to the Denver Post's account of the meeting.

"With the current management that you have, with your current finances, with the current opportunities that I think are available, and the fact that the market has finally decided that you're doing a great job, I think my time has come."

He addressed Level 3's challenges: "Who would've predicted that at the start of our new business, there would be a telecom meltdown, a tech wreck, terrorist attacks, a worldwide financial crisis and the Great Recession?"

In late 2003, Scott transferred most of his Level 3 holding, worth about $54 million at the time, to his family foundation. At the purchase price, those shares have doubled in value.

Level 3 has grown partly by acquisition, including Global Crossing, mostly an undersea cable company, in 2011 and TW Telecom, a networking company, in 2014.

Despite its rocky financial history, Level 3 represents an opportunity for CenturyLink.

The company, based in Monroe, Louisiana, had acquired Qwest Communications, the successor to U.S. West, which in turn was the successor to Omaha-based Northwestern Bell Telephone Co., a part of the old Bell System.

A "yes" vote on the sale is likely because most shares of both companies are owned by investment groups that, by their public silence, appear to favor the deal. Level 3's largest shareholder, a branch of Singapore's telecommunications agency, pledged its support in advance.

Directors of both companies endorsed the plan.

In a conference call last week, Ewing Stewart, CenturyLink's chief financial officer, said adding Level 3 would make CenturyLink the second-largest telecommunications company, moving past Verizon but trailing AT&T.

CenturyLink, which employs about 900 people in Omaha, said Level 3's past losses would offset income taxes it would owe on upcoming profits. Adding Level 3's global network will give it a presence in more than 60 countries, making it "positioned to further enhance the scope and transmission speeds of its broadband infrastructure."

Another advantage: the ability to meet customers' "demand for more bandwidth" and new communications services.

Eliminating duplication and consolidating operations would save $850 million a year, CenturyLink said.

Bischof, the retired Kiewit executive, said it's doubtful any other company will be able to duplicate Level 3's fiber network.

"Two hundred years from now, it'll turn out that Walter was exactly right," said Bischof, who sold his Level 3 shares years ago. "The only problem was

"Two hundred years from now, it'll turn out that Walter was exactly right," said Bischof, who sold his Level 3 shares years ago. "The only problem was, Walter's time frame on everything was 200 years, and for all the rest of us it was like three years."

He said early Kiewit-based shareholders who still have the stock will make money in the CenturyLink buyout because their original purchase price was so low — in Bischof's memory less than 50 cents a share.

At 50 cents a share, the equivalent purchase price of $4.43 represents a large gain. But from Level 3's first price on the Nasdaq exchange, $62 a share, it's a 93 percent loss. During that time, the overall stock market has nearly tripled.

For more recent Level 3 stock purchasers, the CenturyLink offer is 42 percent higher than the price last year before news accounts of a potential sale affected the trading price.

Some shareholders made money by selling shares at a profit years ago. Others donated shares to charity, gifted them to their children or passed them on through their estates.

But those who bought shares at high prices lost.

"They're out a bag of bucks," said one former Kiewit employee.

Dowd, the retired attorney, said he held onto the shares because it didn't seem worthwhile to sell at the lower prices and he figured someone would buy the company and he would get some of his money back.

"I always thought Walter Scott was going to pull a rabbit out of the hat," he said. "He never did."

Besides, Level 3 has improved, he said. The company has focused on cutting costs, improving efficiency and boosting sales, such as a lucrative 2013 deal to supply broadband connections for 7,000 Starbucks locations and high-volume customers like Netflix and Google.

"You've got to commend the present management," Dowd said. "They go in there and got the company moving, and moving well enough that someone was interested in buying them out."

2000 (May 6) - NYTimes : "New Life for Old Railroads; What Better Place to Lay Miles of Fiber Optic Cable"

By Jane Tanner / May 6, 2000 [HN01H3][GDrive]

Henry Flagler came to Florida in 1883 to build grand hotels in what was sparsely populated coastal scrub. Using wealth amassed as one of the Standard Oil Company's founders, he began cobbling together a railroad down the length of the state. He opened up Florida as he went, erecting posh resorts like the Palm Beach Inn, later called the Breakers, that would serve as starting points for future cities. By 1896, he had built 350 miles of track from Jacksonville to Miami.

Now Florida East Coast Industries, the holding company controlling the Flagler railroad, is using the right of way to establish itself in the new economy. Since last May, the company's subsidiary, Epik Communications, has been selling capacity to move digital information through fiber optic cables that run alongside chugging train cars piled high with crushed stone, building materials and vehicles.

Like most railroads, Florida East Coast Railroad had been collecting rent from giant telecommunications companies that had buried cable beside its tracks. But two years ago the company decided to jump directly into the market for bandwidth capacity. Just shy of one year into its venture selling transmission capacity to telephone companies, wireless services and Internet service providers, Epik's network covers 80 percent of Florida's population and extends west to Texas and north to Atlanta. The revenue backlog is $60 million.

"What makes it a great railroad franchise is what makes it a terrific telecom franchise," says Robert Anestis, the chairman, president and chief operating officer of Florida East Coast Industries, who came on board in January 1999 to exploit the telecommunications potential. "We're in the center of growth."

The story of how the little railroad leveraged the dirt along its tracks to leap into fiber optic communications provides a glimpse into some of the swaps and barters used to create a glass network for the streams of digital bits and bytes cycling around the globe. It also suggests how some old-economy transportation and power companies may find prosperity in a cyberage.

Railroad tracks make good paths for telecommunications cable because they offer cleared, linear routes. In fact, special railroad cars run along tracks plowing cable underground as they move. The cost of assembling such paths for conduits from scratch would be astronomical.

In the same way, energy and utility rights of way are used for fiber optics. For instance, the Williams Companies created a whole new venture by putting cables along its natural gas pipelines. Consolidated Edison's infrastructure is being used for fiber optic lines into 2,000 buildings in New York.

Southern Pacific Railroad is the textbook example of a railroad creating telecommunications companies, having spawned both Sprint and Qwest Communications International.

In this latest sweep of new entries along with FLorida East Coast are the Norfolk Southern Corporation and the CSX Corporation. "The pickings have been so good, a lot of people have been getting into this industry," says Tim Caffrey, who follows telecommunications for Standard & Poor's.

While Florida East Coast is small, it is beginning to attract attention. Since January 1999, its stock has gone from $27 a share to over $46; its market capitalization has risen from $800 million to just under $1.8 billion. In mid-April an investment group including the Texas billionaire Robert Bass acquired a 5

percent stake in the holding company, based in St. Augustine, Fla., with its railroad, trucking, real estate and now telecommunications businesses.

"It's in the nascent stages, but the company is beginning to make a major play in the telecom industry," says Andrew Hamerling, an analyst at BancAmerica Securities.

Florida East Coast was a fairly inert company until Mr. Anestis began to kick-start the assets that Mr. Flagler had put into place 100 years earlier. The company and the St. Joe Company, which held a 54 percent stake in Florida East Coast until recently, had lagged under the control of the conservative Alfred I. duPont Testamentary Trust.

But in the early 1990's, investors pressed St. Joe to start exploiting its assets for better shareholder returns. It shed operations like a paper mill, telephone company and bank to focus on its one million acres of real estate in the Florida Panhandle for resort development.

When St. Joe took a look at its 53.8 percent stake, it decided that it should put the company up for sale. But Mr. Anestis, then a consultant to Peter S. Rummel, St. Joe's chairman, convinced him that there was better way to capture the value of the telecommunications potential.

"I told him it's much better to jump into this thing proactively," Mr. Anestis recalls.

Mr. Anestis had had an eye on the company's telecommunications rights of way for some time. In the early 1980's AT&T, MCI, WorldCom and other big players installed fiber optic cables along Florida East Coast Railroad lines to reach the state's growing cities. These leases were a no-cost stream of passive revenue. The next big cable construction wave followed the 1996 telecommunications act. During this second buildup, Florida East Coast decided to get a piece of the digital action.

Mr. Anestis started as a mergers and acquisitions lawyer in Pittsburgh, then headed a railroad holding company, Guilford Transportation Industries, that a client had created. In 1984, AT&T leased right of way from Guilford on an unused line in the White Mountains to add capacity to its Boston-to-Montreal fiber link. The old line, with small trees growing in the tracks, showed Mr. Anestis how valuable such linear paths could be. Mr. Anestis left Guilford and started an investment advisory firm, still consulting with railroads and negotiating right of way leases with telecommunications companies.

In 1997, when Qwest wanted to bury cable on Florida East Coast Railroad routes, Mr. Anestis negotiated on behalf of the railroad and got Qwest to build three conduits for Florida East Coast as part of the bargain.

The next year when Williams was anxious to add Florida capacity along the railroad's right of way, Mr. Anestis brokered a deal for 36 strands of dark fiber from Williams. Dark fiber is unactivated cable.

Instead of being just a passive landlord, Florida East Coast now had telecommunication assets, but it did not know how to deploy them. "We were pretty good horse traders, but we really didn't know what to do with this," Mr. Anestis said. Soon after these deals, he was made head of Florida East Coast Industries.

Mr. Anestis hired strategic consultants at the Cambridge-based Monitor Company to determine whether 3 empty conduits and 36 strands were enough to jump-start a new telecommunications company. Each 1.25-inch conduit can hold 216 fiber optic strands. Two strands of activated cable can transmit 129,000 simultaneous telephone calls. New technology is expected to increase that number a hundredfold.

John McClellan, Monitor's head of telecommunications, concluded that the venture could work. Florida's economy was expected to grow 37 percent faster than the rest of the country over the next 10 years. The company's rights of way, conduits and fiber amounted to a base to reach the majority of the state's population.

Florida East Coast also had enough capital to invest nearly $100 million in cash to get the initial parts of the business up and running.

At the end of the consultation, Mr. McClellan decided to leave his 16-year career at Monitor to head the new Florida East Coast venture.

Now, Mr. McClellan splits his time between his home in Groton, Mass., and Epik's headquarters in Orlando. He took a two-thirds pay cut, spurred by the prospect of stock options. Mr. Anestis said Epik could go public in as few as six months, but acknowledged that market volatility could extend that timetable.

"I entered into this knowing we're in this a while trying to build a business," Mr. McClellan said.

Under Mr. McClellan, Epik has extended its reach beyond Florida in fiber and conduit swaps with Enron Broadband Services and Broadwing Communications.

"We're becoming experts in swaps and barter," Mr. Anestis said. Trade-outs allow quick geographic links without time-consuming installation. Fiber optic companies build excess capacity so they can use it as capital in future trades.

Florida East Coast and Epik officials, meanwhile, are huddling over aerial photos of the 18,000 Florida acres that Mr. Flagler accumulated and that remain under company control.

Gran Central, a real estate subsidiary, has built a portfolio of high-end office complexes and industrial buildings. Now, the company is considering the land for Telecom Hotels, high-rises intended to house equipment needed to keep data flowing smoothly. The company is also considering constructing office buildings prewired for the latest technology.

Many railroad industry executives are looking for new opportunities. Last year, Norfolk Southern created a subsidiary, Thoroughbred Technology and Telecommunications, or T-Cubed. The railroad plans to lay conduit and use its microwave towers to sell bandwidth capacity to carriers.

In March, CSX signed an agreement with Pathnet Inc., a wholesaler of bandwidth based in Reston, Va., to provide railroad right of way in exchange for equity in Pathnet. Burlington Northern Santa Fe and Colonial Pipeline also signed "right of way for equity" deals with Pathnet.

With all these new players, Mr. Caffrey at Standard & Poor's and other industry watchers say a glut of fiber capacity may be on the horizon. Mr. Anestis is not flustered by the prospect. "We assumed that this supply would cause prices to fall," he said. "Even so, with the slope of growth there's a great business here."

Correction: May 13, 2000

Because of an editing error, an article in Business Day on May 6 about the move of Florida East Coast Industries into the telecommunications business misstated the company's ownership. While the St. Joe Company, which holds nearly 54 percent of the company's shares, plans to spin off its stake to shareholders later this year, it has not yet done so.

1998 (April 1) - USA Today - "Fathers of Invention: How Level 3 Worked its Way to the Main Floor"

Source - [HN01CU][GDrive]

[HN01CV][GDrive]
Caption on the image that appeared on the USA Today Cover (at right): Billionaires Warren Buffett of Berkshire Hathaway, Bill Gates of Microsoft, and Walter Scott of Peter Kiewit Sons' crossed paths in 1995 at a manion in Dublin, Ireland, where they discussed the Internet. The result is James Crowe's Level 3 Communications, a budding force in the Telecom Industry.

Walter Scott, CEO of Peter Kiewit Sons', calls the group "Our Gang." They are Warren Buffett's billionaire and executive friends, including Scott, Microsoft CEO Bill Gates and former Coca-Cola President Don Keough.

Every two years, Buffett invites about 30 of them and their significant others to a multi-day retreat. In the summer of 1995, they gathered at a mansion outside Dublin, Ireland. The topic was the Internet. Gates and his wife, Melinda French, gave a presentation. It jarred Scott.

Over the decades, [**Walter Scott Jr. (born 1931)**] had so successfully run publicity-shy [**Kiewit Corporation**] - a builder of roads, dams and other monster projects - that the company often had excess cash to invest. One investment was funding [**James Quell Crowe (born 1949)**] in 1989 to build [**MFS Communications Company, Incorporated**], a phone network that would compete against the big local and long-distance phone companies for mostly corporate business. By the time of the Dublin retreat, MFS was the biggest of the so-called alternate access carriers.

Gates told Our Gang that the Internet was going to be huge and that he was swinging Microsoft to meet it. He said the Net would threaten the traditional phone powers by sucking away data and voice traffic. Scott realized MFS, too, could be hurt by the Internet. "Afterwards, I sat down with Bill and talked with him about it," Scott says. "My gut feeling was, if you weren't part of it, you were going to be left behind."

Scott flew back to Omaha with Buffett, whose office is on a floor of leased space in Kiewit's headquarters here. Scott sat down with Crowe "and talked to him about where Bill's head was." Scott wanted Crowe to look into the Internet.

Crowe says, "He told me that anytime anyone's told him there's a risk, there's always been an opportunity there."

Crowe launched what MFS called Project Silver to study the the Net and what MFS should do in response. That was the genesis of Level 3 Communications. Today, Level 3 is listed for the first time as a public company on Nasdaq. It begins life with a market value of $10 billion and a loud buzz.

A revolution in the making?

Level 3's business plan, if correct in its assumptions, could drive down the cost of long-distance phone calls to almost nothing and hasten the decline of the big phone companies.

Level 3 plans to build a global fiber-optic communication network entirely based on Internet Protocol (IP) technology. Crowe is betting that the dominant networks of the world — the ones that carry phone calls using circuit-switching technology based on a 100-year-old design — are dinosaurs.

Not everyone agrees, least of all phone company people. "There's a bright future for IP, but it's not a walk-away win," says Arno Penzias, chief scientist for Lucent Technologies.

And there's a twist to Level 3's story that could make things interesting. Level 3 has made a dangerous enemy: Bernie Ebbers, the dynamic and powerful CEO of WorldCom.

Yet for many reasons, the industry is watching Crowe closely. After all, he built MFS into an industry power, then sold it to WorldCom in 1996 for $14.3 billion. And he has an injection of $3 billion in cash and assets from Kiewit for Level 3.

"It's like watching him trying to make lightning strike twice," says industry analyst Jeffrey Kagan.

In 1995, the Internet was just taking off and Project Silver team members could find little reliable analysis beyond the fact that the Net was messy, unreliable, interesting and cheap.

Crowe's epiphany came when he flipped through an industry newsletter and saw a chart from consulting firm North River Ventures titled, Cost to Deliver 42 Page Document. Faxing it from New York to Tokyo using AT&T cost $28.83. E-mailing it over the Internet cost 9.5 cents. "That's when I realized this was not driven by cool people on the cover of Newsweek," Crowe says. "It was driven by economics. When we figured it boiled down to bucks, all of us took notice."

The Project Silver team visited 20 to 30 Internet service providers (ISPs). Crowe went to six. The team concluded that to move fast, MFS would have to buy its way into the Internet. The best ISP to buy was [UUNET Technologies, Incorporated]. The path had come full-circle back to Gates. Microsoft owned 14.7% of UUNet and Microsoft Network was its biggest customer.

Crowe and Scott flew to Microsoft headquarters in Redmond, Wash., to talk to Gates. If Gates had said no, MFS would not have tried to buy UUNet. Gates gave his OK. His only condition was that Crowe had to keep UUNet CEO John Sidgmore. In April 1996, MFS bought UUNet for a stunning $2 billion.

Clash of the titans

Crowe, 48, has big facial features and a booming voice. He prefers to dress casually in a Dockers style. He's a technology nut who wired all kinds of gadgets together in his home. He eats lunch in the cafeteria on the ground floor of Kiewit headquarters. Level 3's offices are in one small corner of the stoic 15-story building.

People describe Crowe as incredibly focused, good at communicating a point simply, good at recognizing and hiring talented people and a voracious reader. (One of his favorite books: Snow Crash, a science-fiction novel about cyberspace, by Neal Stephenson.) "He's very intelligent," Scott says. "And he gets loyalty and enthusiasm from his people."

That loyalty is what got Crowe in trouble with WorldCom's Ebbers. WorldCom, based in Jackson, Miss., has grown by making ever-bigger acquisitions, mostly in the long-distance phone business. Ebbers needed a company like MFS, which has lots of local networks and business customers. UUNet made MFS even more attractive. Within months of MFS buying UUNet, WorldCom made its $14.3 billion offer for MFS.

Crowe did not want to sell MFS, but the offer was too good. He knew the Internet train was coming and that MFS, mostly built on the older circuit-switching technology, would have a rough time making the transition — even with UUNet's help.

Crowe was to become chairman of the merged MFS and WorldCom, but it was clear he'd be second to Ebbers, who would be CEO. Most of MFS' top management packed up their Omaha homes and moved to Jackson. Three weeks after the merger closed, Crowe quit and returned to Kiewit.

"I was talking with Jim (Crowe) about what he'd like to do and told him we'd be willing to support him if he was interested in starting a business," Scott says. Kiewit has two parts. The main one is the construction business. The other one is Kiewit Diversified Group, which holds all Kiewit's investments in companies. Those companies have ranged from small telecommunications ventures to a power company. Scott asked Crowe if he'd like to take over Kiewit Diversified Group. "I felt Jim would do more with it than I would." Total value of the group: about $3 billion. It would become Crowe's seed money.

Reinventing a success

The concept for Level 3 is simple: It's MFS with a fresh start. Same business plan, but this time based on Internet Protocol (IP) technology. Crowe would use Kiewit's money to start building a network that could carry information and voice conversations far more efficiently than any network out there, then slowly fill his fiber-optic pipelines by siphoning off business from the telecom giants.

Crowe wasn't the only one with the idea. Around the time Crowe quit WorldCom, Qwest Communications was starting to get noticed. Based in Denver, Qwest was using money from railroad magnate Philip Anschutz to build its fiber network, which would be partly IP-based and partly circuit-switched. Anschutz put Crowe on Qwest's board. Qwest also hired fiery AT&T executive Joe Nacchio as CEO. From the outset, Crowe told Nacchio he might start a competing business.

Just before unveiling Level 3, Crowe quit Qwest's board. Now he's moving Level 3 to Denver, right in Qwest's back yard, to take advantage of telecommunications talent in that region. Relations between the two are said to be chilly. Nacchio did not respond to requests to talk about Crowe.

In the meantime, Crowe figured that if he was going to do an MFS all over again, he might as well get the MFS team back. One way or another, he got 18 of his top 20 MFS executives out of WorldCom. Most have taken the exact jobs they had at WorldCom. All were wealthy enough after MFS' sale to never work again, but they're in their 30s and 40s and sound thrilled to be back together for another run. Mike Frank, 44, head of Level 3's human resources, says that at WorldCom: "My usefulness was not appreciated, and I wasn't fulfilled."

"I have a lot of loyalty to the guys who got me here," says Ron Vidal, 37, another member of Crowe's reconstituted team.

Crowe's departure from WorldCom irritated Ebbers. But the mass exodus made him boil. The rancor runs deep throughout WorldCom. WorldCom would like nothing better than to bury Level 3 in the marketplace.

That threat notwithstanding, the combination of Kiewit's backing, the old MFS team and Crowe's savvy makes many in telecommunications believe Level 3 will succeed. "There's a lot of faith," says analyst Kagan.

Investors are expected to snap up the stock. Before the Nasdaq listing, shares were tough to come by. Peter Kiewit Sons' stock is privately held by employees only. Kiewit Diversified was held mostly by employees and former employees, though shares could be sold publicly. With the Nasdaq listing, an official split from Kiewit and a name change from Kiewit Diversified to Level 3, the stock goes public.

It's too soon to tell whether Level 3 can challenge some of the regional Bells or top long-distance companies. The telecom giants know about the efficiencies of IP, too, and some are building IP-based networks. They scoff at the notion that circuit-switched networks will become albatrosses. "Nobody's stupid here," Lucent's Penzias says. He holds that communications will wind up being a mixture of circuit-switching and IP. "One protocol to do every job would be a step backward."

Meanwhile, WorldCom, Qwest and others are building IP fiber networks. Teledesic and Motorola's Celestri will create high-bandwidth IP networks using satellites by around 2003. Still, demand is exploding. Communications capacity is already in short supply for data traffic, which is growing 150% or more a

year. Voice calls over IP networks, a business that barely existed in 1997, will be at least a $1 billion industry by 2002, according to Forrester Research. [...]

1998 (May 25) - Washington Post - "E.SPIRE RINGS UP SALES AGAINST THE BELLS"

By Mike Mills / Source : [HN01H5][GDrive]

Most every successful start-up company has been through a period when it seemed things were about to fall apart. For e.spire Communications Inc. of Annapolis Junction, that time was April of last year.

A technology stock slump was hurting all small new companies, including "competitive local exchange carriers" such as e.spire, firms that planned to take on the huge Bell companies on their own turf with discount local phone service.

The company had planned to raise $133 million in a secondary public offering in the summer of 1996, but pulled the plug on the sale after existing shares sank from $14 to about $8. By April 1997, things were even worse -- the stock was around $5. But the company was forced to forge ahead with its stock sale, even at that low price. It raised just $40 million instead of its already scaled-back hope of $80 million.

"We had no choice. We had about three months of cash left," recalls chief executive Jack Reich. "Had we not raised money at the beginning of 1997," he trails off, then finds a way to put it diplomatically, "the company would have been facing decisions outside of its control."

Reich can smile about those hard times now. The company has since raised $635 million through further equity and debt offerings and has a market value of $850 million. Using today's highflying stock market as a tail wind, the shares of e.spire, formerly known as American Communications Services Inc., or ACSI,

now trade at $17 to $19 apiece.

But don't give Wall Street all the credit: Reich, who joined the company at the height of those cash troubles, has been busy transforming it from an early-stage construction enterprise, laying fiber-optic lines under the streets of American cities, into a revenue-generating business.

The company moves a broad line of voice and data services through its optical pipes and offers enough hand-holding to persuade business customers to abandon their longtime relationships with their local Bell telephone companies.

It's undergone an image make-over, including the new name. The smell of new carpeting and paint permeates its recently completed headquarters in a rural business park between Interstate 95 and the Baltimore-Washington Parkway. The company employs 350 of its 850 workers there.

How to count the ways in which e.spire has grown? - Revenue: $4.2 million at the end of 1996; $59 million at the end of 1997. During the first three months of 1998, $27.5 million. (It remains unprofitable.) - Phone lines in service: 360 at the beginning of 1997; 71,688 as of May 7. - Number of buildings where the service is available: 595 at year-end 1996; 1,912 as of this month. - Sales staff: 77 at the end of 1996; 220 today.

E.spire's growth is outstripping most other competitive local exchange carriers, also known as C-LECs. It ranked first on Network World magazine's recent list of the top 200 "hot growth companies," edging out Excite, Yahoo and AT&T's Teleport Communications Group.

"E.spire is one of the most attractive" competitive local carriers, said Frank Murphy, vice president for telecommunications research at securities firm Wheat First Union in Richmond. "They've really taken a lot of the complexity out of data sales for customers."

Under Reich and his sales and marketing team, Murphy said, "the company has changed directions. They've been able to distance themselves from the perception of the old ACSI as a fiber company with very little marketing direction."

E.spire and its fellow upstarts are taking advantage of the 1996 Telecommunications Act, the much-maligned law aimed at opening the $100 billion per year local telephone market to competition.

While most residential consumers remain without a choice of local phone service (most companies say there's no money in it), competition is starting to boom in downtown business areas. There, multiple rivals are able to offer local phone service along with data lines. And there's nothing but growth ahead. Companies such as e.spire have just less than 2 percent of the local calling market, and they're picking off business customers from the Bells like so much proverbial low-hanging fruit.

E.spire is among the first of its type to recognize a fundamental shift in the way such companies are valued by Wall Street, according to Murphy: "Now, in the past 12 months the focus has shifted to favor whoever is leveraging those assets into sales and traffic."

Eighteen to 24 months ago, he said, investors were adding $4 to $5 of market value for every $1 a company such as e.spire sank into its fiber property and equipment.

"That was the best way to measure the value of these companies," Murphy said. "E.spire hadn't shown that it had the wherewithal to properly sell its network. But the new management team has focused almost entirely on enhancing the value of its network. In my universe of fiber-based C-LECs, they've got the second-highest annualized revenue growth."

E.spire's strategy has been to focus on second-tier southern cities, leaving the big cities to AT&T Corp., MCI Communications Corp. and other giant competitors. Today the company has strung cable along 100,000 miles of routes and connected it to 50 switches. Those networks serve 250 customers in two dozen cities from Texas to Baltimore.

Most customers are small and medium-sized businesses with at least 10 phone lines. E.spire's bigger clients include Humana Healthcare and oil giant Ashland Inc., both in Kentucky.

E.spire already has entered the Washington market by "reselling" under its own name capacity it buys from Bell Atlantic Corp. Now it is wiring the streets of the area's business centers to begin operating its own network. The company recently completed a 109-mile fiber-optic loop connecting the city to Baltimore, and plans to install new switching equipment in the District.

Reich brings more than 15 years of telecommunications experience to e.spire. He spent eight years, from 1986 to 1994, at MCI, following stints at AT&T and telephone switch maker Rolm Corp.

At MCI he oversaw international accounts and played a key role in the early stages of MCI's venture with British Telecommunications PLC, called Concert. From there he went to the midwestern Bell company Ameritech Corp. for two years, an experience Reich said reminded him "how much more fun it was to grow" than to defend turf.

E.spire founders Anthony Pompliano and Richard Kozak grabbed Reich away from Ameritech in Chicago, where the new company was based until moving to this area in 1995. Pompliano was one of the first people to go up against the Bells. His Chicago Fiber Optic Corp. later evolved into MFS Communications Inc., which then was bought by WorldCom Inc.

With capital spending so much a focus of companies like e.spire, the group is highly vulnerable to fluctuations in interest rates. Recent pressure to raise rates has taken roughly 10 percent off the market value of most competitive local carriers' shares. Recently, e.spire has been trading in the $17 range, down from around $19 earlier this year.

But, given what the company went through in early 1997, Reich said, he's prepared for such seasonal fluctuations: "We've established a great foundation. The sweetness of success is even better when you've gone through a lot of adversity." CAPTION: Jack Reich, chief executive of e.spire, can smile now about the hard times the company faced last year.

In 1988, Kiewit formed a subsidiary, Kiewit Communications Co., which eventually became MFS Communications Corp. (MFSCC), to pursue business opportunities in the telecommunications industry and to provide businesses with an alternative source of local telecommunications services. In June 1989, MFSCC increased to 80% its ownership interest in Metropolitan Fiber Systems, Inc. (MFS Telecom), a company that managed an alternate local communications network in Chicago. James Crowe, CEO of MFSCC; Royce Holland, president and chief operating officer; and Terrence Ferguson, general counsel; were the MFSCC executives primarily involved in these negotiations, with Crowe acting as the lead negotiator. The original owners of the companyArthur Brantman, Anthony Pompliano, Howard Gimbel and David Husmanretained the remaining 20% of the shares in MFS Telecom. In August 1990, the 20% interest was further divided so that 10 individuals held the shares.

Several of the minority shareholders approached Crowe in late 1991 regarding the sale of their shares to MFSCC. Only Anthony Pompliano completed the deal at this time, selling for $85,000 per share in June 1992. In July 1992, negotiations renewed with the remaining minority shareholders, leading to MFSCC's purchase of the remainder of the minority shares for $135,000 per share. MFSCC paid Pompliano an additional $50, 000 per share to equalize his sale price with that of the other minority shareholders.

In May 1993, MFSCC sold 20% of its stock through an initial public offering. As a result, six of the minority shareholders brought an action in March 1994 in the Northern District of Illinois against Crowe, MFSCC and Kiewit. The four-count complaint contained allegations of violations of federal securities laws, fraud, breach of fiduciary duty, and breach of contract and the duty of good faith and fair dealing. MFS was named in all four counts, while Crowe and Kiewit were named in Count I for violation of federal securities laws. Peter Kiewit notified Federal of the lawsuit in June 1994. In August 1994, Pompliano and his wife joined the suit as plaintiffs. Pompliano had served as president and CEO of MFS Telecom from January 1988 until April 1990. He was also a director and vice chairman of Telecom's board from April 1990 until June 1991. Federal learned of Pompliano's joining the law-suit sometime between August and October 1994.

Micro Instrumentation and Telemetry Systems (**MITS**) was an American electronics company founded in Albuquerque, New Mexico that began manufacturing electronic calculators in 1971 and personal computers in 1975.[1]

Ed Roberts and Forrest Mims founded MITS in December 1969 to produce miniaturized telemetry modules for model rockets such as a roll rate sensor.[2] In 1971, Roberts redirected the company into the electronic calculator market and the MITS 816 desktop calculator kit was featured on the November 1971 cover of *Popular Electronics*.[3] The calculators were very successful and sales topped one million dollars in 1973. A brutal calculator price war left the

company deeply in debt by 1974.

Roberts then developed the first commercially successful microcomputer, the Altair 8800, which was featured on the January 1975 cover of *Popular Electronics*. Hobbyists flooded MITS with orders for the $397 computer kit. Paul Allen and Bill Gates saw the magazine and began writing software for the Altair, later called Altair BASIC.[4] They moved to Albuquerque to work for MITS and in July 1975 started Microsoft.

MITS's annual sales had reached $6 million by 1977 when they were acquired by [**Pertec Computer Corporation**]. The operations were soon merged into the larger company and the MITS brand disappeared. Roberts retired to Georgia where he studied medicine and became a small town medical doctor.[5]

Origin

Founders

Henry Edward Roberts studied Electrical Engineering at the University of Miami before enlisting in the U.S. Air Force in 1962.[6] He soon became an electronics instructor at the Cryptographic Equipment Maintenance School at Lackland Air Force Base in San Antonio, Texas.[7] To augment his meager enlisted man's pay, Roberts worked on several off-duty projects and even set up a one-man company, Reliance Engineering. The most notable job was to create the electronics that animated the Christmas characters in the window display of Joske's department store in San Antonio. In 1965, he was selected for an Air Force program to complete his college degree, and became a commissioned officer. Roberts earned an Electrical Engineering degree from Oklahoma State University in 1968 and was assigned to the Weapons Laboratory at Kirtland AFB in Albuquerque, New Mexico.[8]

Forrest Mims was interested in science and electronics as a youth and even built an analog computer while in high school.[9] Mims graduated from Texas A&M University in 1966 (major in government with minors in English and history) then became a commissioned officer in the U.S. Air Force.[10] While serving in Vietnam as an intelligence officer, Mims continued his model rocket hobby.[11] At Texas A&M, Mims developed an infrared obstacle-sensing device and he experimented with it at the Saigon School for Blind Boys and Girls. Launching model rockets in an area accustomed to rocket attacks and working with blind children resulted in a story in the military newspaper, *Stars and Stripes*.[12] This caught the attention of an Air Force Colonel, who arranged for Mims to be assigned to the Weapons Laboratory at Kirtland AFB even though Mims lacked an engineering degree.[13]

Roberts and Mims were both assigned to the Lab's Laser Group in 1968. Roberts had reactivated Reliance Engineering and built an infrared intrusion alarm for his uncle's fish farm in Florida. Later, Roberts and Stan Cagle, a civilian worker who also went to Oklahoma State, started building a power supply they hoped to sell.[14] Mims became an advisor to the Albuquerque Model Rocket Club and met the publisher of *Model Rocketry* magazine in July 1969. Mims told him about a transistorized tracking light that he had used on night launches of rockets in Vietnam. This led to an article in the September 1969 issue of *Model Rocketry*; "Transistorized Tracking Light for Night Launched Model Rockets" by Captain Forrest Mims.[15] Mims became a regular contributor to *Model Rocketry*.

Model rocket kits

Transistorized tracking light for model rockets. The product that launched MITS

Manned space flight and the race to the moon in the 1960s made model rocketry a popular hobby. Roberts, Mims, Cagle and another Air Force officer from the Lab, Bob Zaller, decided they could design and sell electronics kits to model rocket hobbyists.[16] Roberts wanted to call the new company Reliance Engineering, Mims wanted to form an acronym similar to the Massachusetts Institute of Technology's MIT. Cagle came up with Micro Instrumentation and Telemetry Systems, MITS.[17] The December 1969 issue of *Model Rocketry* (circulation 15,000) carried a press release that began:

Reliance Engineering in Albuquerque, New Mexico has announced the formation of a subsidiary company for the manufacture of miniaturized electronic and telemetry systems designed for model rockets. The company is called Micro Instrumentation and Telemetry Systems (MITS). Reliance Engineering president Henry Roberts announced that "MITS is presently conducting an intensive research program involving high quality miniature telemetry systems."

The first commercially available model rocket telemetry transmitter is among the first items to be offered by MITS. Accessory modules including a tone beacon, temperature sensor, and a roll rate sensor, as well as tracking lights, ground systems for data reduction, and light weight, water activated batteries will soon be available.[18]

They designed and built the telemetry modules in their homes and garages but they were only able to sell a few hundred units. Mims had sold a feature article about the new solid-state device, light-emitting diodes, to *Popular Electronics* (circulation 400,000) that May. With the hope of selling kits to the larger readership; Roberts and Mims designed a device that would transmit voice over a beam of light, the Opticom. The editors accepted the project story and both articles were featured on the cover of the November 1970 issue. The payment for the articles was $400 but meeting Les Solomon, *Popular Electronics* technical editor, proved to be significant to both Mims and Roberts future success.

In August 1970, Les Solomon, his wife and daughter were on vacation in the southwest and arranged to visit Mims, Roberts and their families. At that time, Dan Meyer and Don Lancaster were among the most prolific authors in *Popular Electronics*. Meyer had built a million dollar a year business that sold kits of parts to build the project that he and Lancaster wrote about.[19] Mims and Roberts wanted to do the same and quizzed Solomon on the kit business. Solomon gave them some statistics but said there was no way of knowing how many kits an article would sell, maybe a hundred, maybe a thousand.[20]

MITS had purchased components to build 200 Opticoms but only sold around 100 units. Roberts wanted to design a new electronic calculator kit but his partners wanted out. Bob Zaller had already left MITS and Forrest Mims was out of the Air Force and wanted to become a full-time writer. Roberts bought his 3 partners out for $600 in cash and $350 in equipment.[21] (Roberts' four-year commitment to the Air Force ended in mid-1972.) Mims and Roberts remained friends and collaborated on books, magazines and instruction manuals.

Calculators

Sales had reached $100,000 per month when this advertisement ran in March 1973.

Ed Roberts' interest in computers began in high school when he built a simple digital computer from relays. His first real experience with computers came while at Oklahoma State University where engineering students had free access to an IBM 1620 computer. Roberts' office at Weapons Laboratory had the state of the art Hewlett-Packard 9100A programmable calculator in 1968. In July 1970, a semiconductor company, Electronic Arrays, announced a set of six LSI ICs that would make a four-function calculator.[22][23] Roberts was determined to design a calculator kit.

To fund the new project, Roberts sold 15% of MITS to fellow Air Force officer, Lieutenant William Yates. He also got an investment from another Weapons Laboratory officer, Major Ed Laughlin. Several other officers and scientist at the lab were interested in this state of the art calculator kit and helped with the

design. Forrest Mims wrote the assembly manual in return for a calculator kit.

The MITS 816 was known as a "four-function" calculator; it could add, subtract, multiply and divide. The display was only 8-digits but the calculations were done to 16-digits of accuracy. The custom molded case gave the kit a professional appearance; the kit was $179 and an assembled unit was $275. The MITS 816 was featured on the November 1971 cover of *Popular Electronics*.[3] Thousands of calculator orders came in each month, in contrast to poor results for previous kits that MITS had offered.[24]

The steady flow of calculator sales allowed MITS to run full page advertisements in *Radio-Electronics*, *Popular Electronics* and *Scientific American*. In the June 1972 *Radio-Electronics*, MITS announced a 14 digit calculator (Model 1440) with memory and square root function for $199.95 kit and $249.95 assembled. The original 816 kit was reduced from $179 to $149.95. Both calculators could be controlled by upcoming programming unit.[25]

The monthly sales reached $100,000 in March 1973 and MITS moved to larger building with 10,000 square feet (930 square meters) of space.[26] To meet the demand for assembled calculators, an automated wave solder machine was installed.[27] In 1973 MITS was selling every calculator they could make, 110 employees worked in two shifts assembling calculators.[28]

The functionality of calculator ICs increased at a rapid pace and Roberts was designing and producing new models. The MITS 7400 scientific and engineering calculator was introduced in December 1972. It featured trigonometric functions, polar to rectangular conversion, two memories, and up to a seven-level stack. A kit with a three-level stack was $299.95 and an assembled unit with a seven-level stack was $419.95.[29] The next month the Series 1200 four-function pocket calculators were announced. The six-digit model was $59.95 and the twelve-digit model was $99.95.

The Programmer accessory had been mentioned in the earliest advertisement but it was not featured until March 1974. This was the same size as a desktop calculator and could hold 256 programming steps. (It could be expanded to 512 steps.) It was limited to emulating calculator key presses and simple sequence branching. The programming was done by entering hexadecimal key codes. The combination of the MITS 7440 calculator and the programmer was not nearly as sophisticated as the HP 9830 calculator but $400 for both kits was a fraction of the HP price.

MITS calculators

The feature and price information is from advertisements in *Radio-Electronics* magazine (issue date shown). The 816 price is from the original article in *Popular Electronics*.

Model	Description	Introduced	Kit Price	Assembled
816	Desktop, 8-digit display, 16-digit calculations 4-function	Nov. 1971	$179	$275

Price wars

Bowmar Instrument Corporation introduced the "Bowmar Brain", a four-function pocket calculator, in September 1971 and the $179 calculator sold over 500,000 copies in the first year. Bowmar then developed the "901B" calculator that was priced at $120.[32] In September 1972, Texas Instruments (TI) introduced the TI-2500 portable four-function calculator that also sold for $120.[33] The 901B and the TI-2500 both used the TI TMS0100 family of "calculator-on-a-chip" integrated circuit. TI was now directly competing with their IC customers. Other semiconductor companies such as National Semiconductor and Rockwell began selling calculators. Commodore Business Machines and other office equipment companies also got into the market. A frenzied price war started. By early 1974, Ed Roberts found he could purchase a calculator in a retail store for less than his cost of materials. The larger companies could sell below cost to win market share. Bowmar lost $20 million in 1974 and filed for bankruptcy.[34] Commodore acquired their IC supplier, MOS Technology. Texas Instruments won the price war but their calculator division lost $16 million in 1975.[35]

To compete in this market, Roberts needed more capital. He took MITS public in November 1973 with a stock offering of 500,000 shares at $1 each. The 1973 oil crisis caused a stock market downturn and MITS was only able to sell 250,000 shares.[36] This allowed MITS to pay off the existing debt, but did not allow for any expansion. Roberts had developed several test equipment products such as a Waveform Generator and a Digital Voltmeter so he attempted to appeal to kit builders again by featuring the test equipment and digital clocks in the advertisements, instead of calculators. MITS was losing money, and by July 1974, the full page prominent ads were replaced with quarter-page ads in the back of the magazine.[37]

MITS was now $300,000 in debt and Roberts was looking for a new hit product. He decided to return to the kit market with a low cost computer. The target customer would think that "some assembly required" was a desirable feature. Roberts had looked at the Intel 4004 for calculators and thought the Intel 8008 was limited and difficult to work with. Intel had just released the 8080, their first microprocessor that could be a general purpose computer.[38] The target price of this complete computer kit had to be under $400. To meet this price, Roberts agreed to order 1000 microprocessors from Intel for $75 each.[39] Roberts and his head engineer, Bill Yates, began designing the computer. The company was down to 20 employees and a bank loan for $60,000 financed the design and initial production of the new computer.

Popular Electronics and Radio-Electronics

In January 1972, *Popular Electronics* changed its editorial focus in an attempt to attract more advertising revenues. Reviews of stereo equipment and citizens band radio were featured; experimenter and constructions projects were gone. Dan Meyer, Don Lancaster, Forrest Mims, John Simonton and many other authors immediately started contributing to the competing *Radio-Electronics* magazine. The June 1972 cover story was "Experimenting with a $32 Solid State Laser" by Forrest Mims. Another article in that issue was "Experiments with Op-Amps" by B.R. Rogen; this was a pseudonym of *Popular Electronics* technical editor, Les Solomon.[40] Solomon wrote articles for *Radio-Electronics* while working for *Popular Electronics*. Lou Garner, the longtime solid-state editor, moved to *Radio-Electronics* for a year.[41] Several MITS kit projects were featured in *Radio-Electronics* including the ITC 1800 Integrated Circuit Tester (May 1972), the Model 1700 Function Generator (July 1973), the Model 1440 Calculator (July 1973) and the 88 VLCT Computer Terminal (November 1974).

Radio-Electronics had a smaller circulation than *Popular Electronics* but led the way with innovative construction projects between 1972 and 1975. John Simonton's first modular electronic music synthesizer was featured on the cover of the May 1973 issue.[42] It sold for a fraction of commercial synthesizers and his PAiA Electronics produced them for decades. Don Lancaster's TV Typewriter in September 1973 and Jon Titus's Mark-8 computer in July 1974 were the catalyst of the home computer revolution.

Art Salsberg became the editor of *Popular Electronics* in 1974 with a goal of reclaiming the lead in projects. He wanted to publish a computer project that was more functional and elegant than the Mark-8.[43] Les Solomon knew MITS was working on an Intel 8080 based computer project and thought Roberts could provide the project for the always popular January issue.

Ed Roberts and Bill Yates finished the first prototype in October 1974 and shipped it to *Popular Electronics* in New York via the Railway Express Agency. However, it never arrived due to a strike by the shipping company. Solomon already had a number of pictures of the machine and the article was based on them. Roberts got to work on building a replacement. The computer on the magazine cover is an empty box with just switches and LEDs on the front panel. The finished Altair computer had a completely different circuit board layout than the prototype shown in the magazine.[44]

Altair computer

Altair 8800 Computer with 8 circuit boards installed. The Altair floppy disk system below has a [**Pertec Computer Corporation**] 8-inch drive.

Main article: Altair 8800

Products

The Altair 8800 was modeled after early 1970s minicomputers such as the Data General Nova. These machines contained a CPU board, memory boards

The Altair 8800 was modeled after early 1970s minicomputers such as the Data General Nova. These machines contained a CPU board, memory boards, and I/O boards; the data storage and display terminal were external devices. The Teletype Model 33 ASR was a popular terminal because it provided printed output and data storage on punched paper tape. More advanced systems would have 8-inch floppy disks and a video terminal that would display 24 lines of 80 characters such as the ADM-3A. (No graphics were available and lower-case letters were a $75 option.)[45] Most of these computers had a front panel with toggle switches for entering data and lights for displaying it. These were normally used to boot the computer and to diagnose problems.

The Altair 8800 kit came with a front panel, a CPU board with the Intel 8080 microprocessor, 256 bytes of RAM, a 4-slot backplane and an 8-amp power supply for $439.[46] A 1k byte memory board was $176 and the 4k byte was $264. The serial interface board was $124 and the parallel interface was $119. There was a special price for an 8k byte system with BASIC for $995. The Teletype Model 33 ASR was $1500.

When the January 1975 issue of *Popular Electronics* reached readers in mid December 1974, MITS was flooded with orders. They had to hire extra people just to answer the phones. In February, MITS received 1,000 orders for the Altair 8800. The quoted delivery time was 60 days but it was many more months before the machines were shipped. By August 1975, they had shipped over 5,000 computers.[47]

The Altair 8800 computer was a break-even sale for MITS. They needed to sell additional memory boards, I/O boards and other options to make a profit. The April 1975 issue of the MITS newsletter, *Computer Notes*, had a page-long price list that offered over 15 optional boards.[48] The delivery time given was 60 or 90 days, but many items were never produced and dropped from future price lists. Initially, Roberts decided to concentrate on production of the computers. Prompt delivery of optional boards did not occur until October 1975.

The Intel 8080 did not have dedicated circuitry to support dynamic random-access memory (DRAM) because in 1975, this type of memory was still a new technology. MITS wanted to use DRAM because it consumed less power than static RAM. However, they had several design and component problems that led to a high failure rate with their 4K Dynamic RAM board. By July, new companies such as Processor Technology were selling 4K Static RAM boards with the promise of reliable operation.[49] MITS released its own 4K Static RAM board in January 1976.

The only floppy disk drives that were readily available in 1975 were IBM compatible 8-inch drives. MITS selected the Pertec FD400 disk drive which could store over 300,000 bytes of data.[50] The Altair disk controller occupied two boards and had over 60 ICs. The initial units were to be available in August, but were delayed until the end of 1975. The production version of Extended Disk BASIC was released in April 1976. The controller with one disk drive sold for $1,480 (kit) and $1,980 (assembled).[48]

Marketing

Bill Gates was a regular contributor to *Computer Notes*. The MITS-Mobile van traveled all over the US including a stop near the Homebrew Computer Club

The first full page advertisements for the Altair computer appeared in the February issues of *Popular Electronics* and *Radio-Electronics* magazines. Soon MITS was advertising in technical journals such as the IEEE *Computer*,[51] and general interest magazines such as *Scientific American*. MITS was also the most prominent advertiser in the new hobbyist computer magazines such as *Creative Computing* and *Byte*.

David Bunnell joined MITS as a technical writer in the calculator heyday. In April 1975 he created a newsletter so the MITS staff could easily communicate with the customers. The newsletter, *Computer Notes*, was available to customers and other interested readers.[52] It was a large format newsletter; 11.25 by 15.5 inches (286 by 394 mm), and each issue had 8 to 24 pages. In January 1977, it switched to a smaller magazine format and the last issue was produced in January 1978. Bunnell started *Personal Computer* magazine in October 1976 and went on to a successful career as a magazine publisher.[53]

Computer Notes featured a wide variety of authors. Bill Gates and Paul Allen were regular contributors to the early issues. They wrote about Altair Basic and general software topics. Ed Roberts wrote a monthly "Letter from the President" column where he would answer customer questions and even review competing products. MITS engineers, such as Tom Durston and Steve Pollini, would give technical descriptions of new products. Altair owners would contribute software and hardware suggestions and occasionally a complete article.

MITS purchased a camper van in April 1975 and outfitted it with an Altair system complete with floppy disk, a Teletype Model 33 and every accessory MITS produced. The "MITS-MOBILE" was literally a showroom on wheels that would travel from city to city showcasing the MITS product line. They would hold seminars at hotel conference rooms that would draw crowds of over 200 people. The most notable seminar was at Rickey's Hyatt House in Palo Alto, California in early June 1975, where a member of the Homebrew Computer Club left with an unreleased copy of Altair BASIC.[54] After retail computer stores were established in most cities, the "MITS-MOBILE" was retired.[55]

The first (and only) World Altair Computer Convention was held in Albuquerque, New Mexico in March 1976. The convention, organized by David Bunnell, was an overwhelming success; with 700 people from 46 states and seven countries attending.[56] Many of the attendees would go on to become leaders of the personal computer revolution.

Clones

Many companies made boards that could plug into the Altair / S-100 bus.

Owners of mainframe systems and minicomputers could purchase additional memory, interface boards and peripherals from third party suppliers; so it was predictable that owners of the Altair 8800 computer would do the same. MITS's delays in delivery of systems and accessories accelerated the formation of Altair compatible suppliers. The first ones started appearing in mid-1975 and by July 1976 complete computers systems were readily available.[57] The technical manuals for the Altair 8800 provided electrical schematics of the 100 pin computer bus allowing others to design compatible boards. There was not a proper technical standard at the time and some "compatible" boards did not work with other "compatible" boards. Later, the industry developed the S-100 bus standard.[58]

Bill Godbout Electronics in Oakland, CA was the parts supplier to many of the hobbyists and students from Berkeley. George Morrow approached Godbout with several Altair compatible designs that Godbout agreed to produce and sell.[59][60] The October 1975 Byte magazine carried an advertisement headlining "Get your MITTS on a Godbout RAM kit." The 4K byte Altair compatible board was $131.07.

Godbout also sold components to Processor Technology for their 4K Static RAM board and serial / parallel interface board. Lee Felsenstein designed an Altair compatible video board that provided 16 lines of 64 upper and lower case characters on a black and white television. This $160 board became very popular and led to the Processor Technology Sol-20 Computer in 1976.[61]

The IMSAI 8080, the first "clone" of the Altair computer, was released in December 1975.[62] It corrected many shortcomings of the original Altair 8800 by providing a larger power supply, a 22 slot motherboard, and easier wiring of the front panel. Ed Roberts reviewed the IMSAI in his April 1976 column in

Computer Notes, and agreed that the IMSAI was in some ways better than the original Altair. Roberts also pointed out that the new Altair 8800B was superior to the IMSAI 8080 and the upgraded Altair 8800A fixed the same issues that the IMSAI did.[63]

Altair computers were only available from the 20 or so authorized Altair computer dealers, but the IMSAI 8080, Processor Technology Sol and many other clones were sold by hundreds of newly opening computer stores.

The S-100 bus was used throughout the 1980s until it was overtaken by the IBM PC ISA bus. Seattle Computer Products (SCP) was a manufacturer of S-100 memory boards. The company's engineer, Tim Paterson, designed an Intel 8086 CPU system on two S-100 boards in 1979. Microsoft, then in nearby Bellevue, Washington, used the prototype machine to test their 8086 version of BASIC. Digital Research had promised to deliver an 8086 version of their CP/M operating system by December 1979 but missed that date. SCP needed a disk operating system to sell its 8086 products so Patterson wrote QDOS, a "Quick and Dirty Operating System" in three months. Microsoft would later purchase QDOS from SCP for $50,000 and use it as the basis for the IBM PC DOS.[64][65]

Altair BASIC

Main article: Altair BASIC

An Altair 8800 kit with 8 KB of memory and Altair BASIC cost only $995 in August 1975.

In December 1974 Bill Gates was a student at Harvard University and Paul Allen worked for Honeywell in Boston. They saw the Altair 8800 computer in the January 1975 issue of *Popular Electronics* and knew it was powerful enough to support a BASIC interpreter.[66] They wanted to be the first to offer BASIC for the Altair computer, and the software development tools they had previously created for their Intel 8008 microprocessor based Traf-O-Data computer would give them a head start.[67] While their friend, Paul Gilbert, was building the computer, Allen wrote a program that ran on a DEC PDP-10 time-sharing computer that simulated the 8008 system. He also modified DEC's macro assembler to produce the machine code for the 8008 microprocessor. The Traf-O-Data software could be written and debugged before the computer hardware was complete.[68]

Harvard had a DEC PDP-10 that was available for student use. They would use it to develop BASIC.[69] While Allen modified their development software for the new 8080 microprocessor, Gates began writing 8080 assembly language by hand on yellow legal pads. They enlisted another Harvard student, Monte Davidoff, to write the math routines.[70]

By early February the program coding switched from legal pads to the PDP-10 and a preliminary version was completed by March 1975.[71] Gates and Allen had been in contact with Roberts and MITS and the older looking Paul Allen would travel to Albuquerque in March. MITS needed more time to get a computer with 7k bytes of memory working, and they needed more time to get the software finished. When Allen arrived at MITS it took a day to get the software running; Allen remembers this being caused by computer memory problems[72] while Roberts remembers the delay was due to software problems.[73]

The April 1975 issue of the Altair Newsletter, Computer Notes, had a banner headline "Altair BASIC - Up and Running". The software was to begin shipping on June 23, 1975.[74] The software price was $500, but discounted to $75 with the purchase of an Altair computer with 8k bytes of memory and a serial I/O card.

On July 22, 1975 MITS signed a contract for the Altair BASIC with Bill Gates and Paul Allen. They received $3000 at signing and a royalty for each copy of BASIC sold; $30 for the 4K version, $35 for the 8K version and $60 for the expanded version. The contract had a cap of $180,000. MITS received an exclusive worldwide license to the program for 10 years. They also had exclusive rights to sub-license the program to other companies and agreed to use its "best efforts" to license, promote and commercialize the program. MITS would supply the computer time necessary for development; a PDP-10 owned by the Albuquerque school district.[75] Paul Allen left his job at Honeywell and became the Vice President and Director of Software at MITS with a salary of $30,000 per year.[76] Bill Gates was still a student at Harvard and just a contractor with MITS. The October 1975 company newsletter gives his title as "Software Specialist".[77]

The price of Altair BASIC to customers who purchased additional memory and I/O boards from MITS was $75. Users may have gone along with that if the memory board were reliable. Customers bought the computer from MITS, and working memory from companies like Processor Technology. Rather than pay $500 for BASIC, they would acquire bootleg copies of the software. Only about ten percent of the early customers actually purchased BASIC.[78] With a royalty due of $30 per copy, Gates felt that the computer hobbyist were stealing money from him. In February 1976 Bill Gates, "General Partner, Micro-Soft", wrote an "Open Letter to Hobbyists" that was sent to every computer publication insinuating that the hobbyists were thieves.

MITS had announced a new computer based on the Motorola 6800 microprocessor in November 1975, the Altair 680. The machines were supposed to ship in January 1976, but hardware design problems delayed shipment until May.[79] Paul Allen rewrote their 8080 simulator to support the 6800 microprocessor. Ric Weiland, a high school friend of Gates and Allen, converted the Altair BASIC's 8080 assembly language to 6800 assembly language. To eliminate the per copy royalty loss issue, the 6800 BASIC was licensed to MITS on a non-exclusive basis for a flat fee of $31,200.[80] Weiland and Marc McDonald were impressed with the new MOS Technology 6502 microprocessor that was a derivative of the 6800. They modified the 6800 development system to support the 6502 and "cranked out" a 6502 edition of BASIC. This version was later sold to Commodore and Apple.[81]

The January 1976 issue of MITS's newsletter, Computer Notes, carried an ad for 8080 BASIC. The last paragraph stated: "Licenses for source listing and rights to distribute the binaries are also available to OEM buyers. Write or call Mr. Paul Allen at the MITS plant in Albuquerque for more detailed information."[82] Microsoft found several corporate customers for BASIC and proceeds were evenly split with MITS. Pertec acquired MITS in December 1976 and refused to allow any more OEM deals, even though the agreement required MITS to uses their "best efforts" to license the software. The contract required MITS and Microsoft to use binding arbitration to settle disputes. In September 1977, the arbitrator ruled in favor of Microsoft, MITS could continue to use BASIC on their machines but lost the exclusive license. Microsoft could license the software to anyone and keep all of the royalties.[83]

There was no longer a business requirement to remain in Albuquerque so Microsoft wanted to relocate to a larger city that would be more attractive to new employees. The San Francisco bay area was considered but Allen and Gates decided to return home to Seattle. Microsoft moved to Bellevue, Washington in January 1979.

Sale to Pertec

In 1976, MITS had 230 employees and sales of $6 million.[84][85] Roberts was tiring of his management responsibilities and was looking for a larger partner. MITS had always used [**Pertec Computer Corporation**] disk drives[86] and on December 3, 1976, Pertec signed a letter of intent to acquire MITS for $6 million in stock.[87] The deal was completed in May 1977 just before the National Computer Conference in Dallas, Texas. Roberts got $2 million and the other

500 MITS shareholders (including the Altair co-designer, William Yates) split the rest.[88][89]

[**Pertec Computer Corporation**] was eager to increase sales to small businesses through the 26 Altair Computer stores across the United States. The marketing toward hobby/home user was curtailed. The November 1977 issue of the MITS newsletter, Computer Notes, was the last produced by the Albuquerque staff. There was one more issue produced by the [**Pertec Computer Corporation**] staff in Chatsworth, California.[90] The back cover of the leading home computer magazine, Byte, always carried a full page Altair advertisement. This ended with the September 1977 issue. Roberts and Yates stayed on and worked on special projects.

In August 1979, [**Pertec Computer Corporation**] agreed to sell a 45% stake to North American Philips for $37 million. Before the deal was complete, Pertec agreed to be acquired by the West German computer company, Triumph-Adler, for $120 million. In 1978, Pertec had sales of $150 million and Triumph-Adler had sales of $466 million.[91][92]

The Altair products were merged into the [**Pertec Computer Corporation**] line and the MITS facility was used to produce the PCC-2000 small-business computer. The Albuquerque plant was closed in December 1980 and the production was moved to Pertec plants in Irvine, California.[93]

By the end of 1977 Roberts left MITS and returned to Georgia to be a gentleman farmer. He studied medicine at Mercer University in Macon, Georgia and graduated with a M.D. in 1986. Roberts practiced medicine in Cochran, Georgia, population 4500, until his death in 2010.[94] *[...]*

INTERVIEW - Dec 6 2014

Source : [HI0004][GDrive]

Yevgeny Mikerin [sometimes "**Evgeny Ilyich Mikerin"],** *"father of **Vadim Mikerin**, a representative of **Techsnabexport** who was arrested in the US, recalls his participation in the Soviet atomic project."*

The following was translated in July 29 2019, with the help of https://translate.google.com/ .

Evgeny Ilyich, tell us how it all began?

In 1951 I graduated from the Moscow Institute of Fine Chemical Technology, I was sent to Glazov for three months at the Chepetsky Mechanical Plant. Probably, this time was needed for the paperwork, so that I could work in the First Head Office.

Chain of secrecy?

You can say so ... They called the personnel department and offered to go to Chelyabinsk-40. I refused. I enjoyed working in Glazov. There was a laboratory there, and

I already had time to do something about uranium ... My interlocutor in the personnel department smiled hardly noticeably, and then showed the sheets of the document with the cap "Council of Ministers of the USSR". Showed the place where my name was (there were many others in the list) and the signature: "I. Stalin. " I had no doubts, no questions left. It is necessary - it means it is necessary.

Thus, the majority of specialists went to the "Base 10" (as in those years was called Chelyabinsk-40, and then - the plant "Mayak")?

No one refused. At least, I don't know people who were able to say no after such a signature.

And how did you meet "Base 10"?

A tiny bus from Kyshtym station brought me to the "Far Dacha", in which I lived for two weeks while my documents were being sent. Then it was a hut for those who went to work at a very secret Object ... The documents finally arrived, and the same bus took me to the DOCK (wood-finishing plant). There were barracks too. They put me in a room, ordered me to wait for a guide who was supposed to take me to my place of work. I arrived in the morning, and the guide appeared only in the evening. He brought me to the city in a hostel, where they showed me the room in which I was supposed to live. It was on Stalin Avenue. The dormitory was later rebuilt, adapted for a hotel. If you happen to be in Ozersk, then this is house 19. There was a personnel department next door, and the State Security Committee was closer to the lake through two houses. It was thanks to his staff that the journey to the place of work took quite a long time. I started working at the "25th plant".

What is this plant? Does it exist today?

Yes, only now it is a factory of the Republic of Tatarstan, and earlier in closed literature it was called "factory B. This is the first radiochemical plant in the country, it was built and put into operation in 1948, in March 49th, it began to produce the first plutonium. A bomb was tested in August 1949.

As far as we know, it was the dirtiest enterprise in Chelyabinsk-40.

- So "dirty" that it was even supposed to close the enterprise. Having studied all the "weak points", they wanted to build a new plant. However, plans have changed: the government decided to reconstruct the plant and dramatically increase plutonium production. In addition to the first reactor "A", new ones began to appear - "AV-1", "AV-2", "AV-3" ... So the political situation developed - the "cold war" began, and therefore it was necessary not only to deprive the Americans of the monopoly, but also to show that we have enough nuclear weapons to ensure our security. In general, the thesis "to catch up and overtake America" concerned not only milk and meat, but also atomic bombs. Major events unfolded just in Chelyabinsk-40. For us, this meant one thing: to fulfill the plan at all costs and at the same time to carry out reconstruction to switch to a new, more efficient technology for producing plutonium, which was developed in Leningrad at the Khlopin Radium Institute. We had to go on the move to remove all unnecessary and dangerous. For example, the same filters, in which radioactivity was terrible - residual plutonium and uranium accumulated there. They had to be removed. By the way, because of this, in many respects a new technology was created.

*"**Did you get huge doses there ?!**"*

- We worked at the rate of one x-ray per day. I use the old terminology - it is more understandable and familiar than the current one. For the shift - X-ray, and no more! These were the rules and "combat" rules. In general, as in war. Nuclear, of course ... If you get more x-rays, it means that you violated the rules of radiation safety. Once he broke - a warning, another time - one more, and then the prizes were deprived ... But how not to break if almost every day something happened?

- Simple arithmetic: 150 working days and radiation sickness guaranteed?

- I guess, yes. True, radiation - not always. Even operators who did not take part in the liquidation of accidents, so to say, "in a calm atmosphere" received 0.6–0.8 X-rays per shift. Well, if there was a spill of a product, then there was no time for calculating the doses received - the main thing is to eliminate the accident at any cost.

- And the protection?

- Rubber boots and gloves. Fortunately, then Petryanov's filters appeared, they protected the airways. And even before the gauze bandages lacked ...

- Sorry for being frank: how are you still alive? After all, you already - 84 ...

- Officially, I have 283 X-rays. At least as much again I received

A lethal dose - 400 x-ray?

- Well yes. If you get it right away ... Yes, I'm alive. But my colleagues, with whom I began to work, and almost all those who came to replace me, have long gone ... Plant "B" produced not only plutonium and uranium, but also professional diseases.

In the radiochemical, reactor and metallurgical plants, several thousand professional patients appeared. Half of them did not live up to retirement, they no longer needed it. The X-rays that workers received forced medical workers to remove workers from the main workshops in a year or two. I worked there for three and a half years. There was no one to replace. Constantly there was not enough personnel, because they were constantly replacing everyone. Technicians, operators, equipment, repairmen, electricians, all had to be brought to the "clean zone".

Once I was informed that a group of young technicians was sent to us. They had to accept and distribute to jobs. I came to the office, and there I see the frightened eyes of two dozen girls. They were 18 years old. All dressed in worn coveralls are not for height. And I thought: What have we reached, if these girls are sent here? Until now, I have met some of them, and it is hard for me to look them in the eyes ... But I had to accept them, arrange them in shifts, in workplaces — I had no other choice then ...

As for me, my age, I can explain everything that happens only by the will of the Most High. As a joke, I say this: the 600 x-rays I received burned out all the harmful bacteria and microbes that were inside me. This made it possible to live to this day.

- And how did you encounter the first accident at the factory?

- I would call it "accidents". Accident is when the whole plant is involved, commissions are created and so on. And technological accidents happened all the time. A female operator, for example, overlooked it - the solution overflowed the column and poured out. It spread throughout the premises. Radioactivity is awesome.

"And what happened to that woman?"

- She was tried. A criminal case was initiated against her ... Such were the times ...

- Is it true that academician Petryanov, seeing the girls in your factory, immediately invented special filters to protect their breathing?

- True. Moreover, the academician insisted that the girls should not be sent to the radiochemical plant. However, he was not listened to. And how else: after the war,

the first issues of chemical faculties of universities and colleges consisted only of girls. There were no men. They took the war. When I arrived at the factory, I saw that all five shift supervisors were women. We gradually began to replace them.

- And how did your meeting with Beria happen?

- He came across quite often. Once, it was the 52nd year, and I was already working as a shift supervisor, and it lasted from 8 pm and until 2 am — they called me and said that there would be distinguished guests in the workshop, and therefore I should be at such and such a mark to wait. They will pass by, do not ask them about anything, and if they ask questions, they will answer. They walked along the 10th mark of the main workshop. There was unloading of irradiated fuel and the primary dissolution of uranium blocks. Three people are coming. The new director of the radiochemical plant Demyanovich. A very large man, tough, sometimes even merciless. He did not know the technology well, but he was appointed to restore order at the plant, which he did quite successfully. Someone from the bosses of the First Main Directorate was walking, and in the middle was a little man in a cap and pince-nez. There was a guard behind. I recognized Beria, said hello. He introduced himself, as was the case at the defense enterprise, they say, the shift supervisor, we carry out the task according to the plan, there are no comments on the work of the personnel. Suddenly, Beria said that he was explained in a nearby shop that such and such a product goes there, then another product goes to some banks and columns, and the next product is transferred to this shop. And he says: "Can you not explain to me in a worker-peasant manner what is being done here and how everything is happening." I explained to him. My story took only a few minutes. I did not use special terms, and plutonium called plutonium, uranium - uranium, which of course was absolutely forbidden to do then. We used the "bird language", which, by the way, was very difficult for the work, since it was really not always possible to understand what was going on. Beria says: "I meet the first person who explained everything clearly and precisely how this process is carried out. Thank you! "He shook my hand and went on.

Two days later I was called to the "31st house", where the security service was located. The boss himself began to talk to me. At first he thanked, they say, Beria was satisfied with my report, and then gave a uniform interrogation. Firstly, how do I know the process technology in other workshops so well? I replied that even though I am a young engineer, I must know this, otherwise I will not be able to work well. It is simply impossible to "pull out" some area from the process. This explanation seems to satisfy him. Well, the second question was unexpected. He asked: "Why did you break secrecy, and the products were called by their proper names?" He didn't say either "plutonium", "nor uranium

- 1957 Power reactors are already working ...

- And just one radiochemical plant.

- But the second is already under construction ...

- Yes, it will be launched in the 59th. Later than planned. The delay happened due to an accident. It should be remembered that in the year 57, radiochemistry was only at Mayak. In Siberia, similar production appeared later, while there was only one factory. Reactors produced plutonium much more than our factory could recycle. In 1952 there was a task to develop a new plant. In the 55th started its construction. In the 53rd, I got a chronic radiation sickness, I had to leave, but I stayed in the factory - there was simply no one to replace. When the construction of a new enterprise began, I was transferred there. The accident of the 57th year I met there. We were preparing to put the first string in the factory. It was a long, five-hundred-meter-long building, in which the full automation of processes was carried out. There were two tasks: first, to dramatically increase the plant's productivity, and, secondly, to ensure the safety of personnel. These tasks were implemented at the design and construction stage.

One day, September 29, 1957, on Sunday, suddenly everyone heard a powerful pop. A few minutes later my bell rang. The duty officer says that I need to go to the factory. We arrived. Not a single person was already on the site. Builders and installers rapidly left her. Littered suits, pants, shoes. It turns out that they received orders to throw off all unnecessary and run towards the high road. There were no other teams. From the site of the explosion, a new plant was located 500 meters away, and a black cloud covered it. We were bombarded with radioactive ash, earth, pieces of concrete and iron. We were five people that evening at the factory. Radiation situation did not know. Finally, dosimetrists appeared. The background was huge, and we realized that the situation was extremely difficult.

- Covered and the city?

- Fortunately, no. The ejection was set aside, only by a small corner of the KP-2, which came from Sverdlovsk, and the new quarters of the city. All the rest of the pollution came from the equipment and clothing of people who came from the industrial site.

- Is it true that in the first hours there was talk of shutting down the production and evacuation of the entire city?

- Such a proposal arose in the morning of September 30, until all the consequences of the accident were known. At that time, they did not have control over the situation and did not really understand what was going on. On Sunday evening, a working committee was already established. It was headed by Nikolai Nikolaevich Semenov (at that time he was deputy chief engineer, then he became director of the plant). We spent the whole day measuring in different directions. We built a new factory in a clean place, and by the evening of September 29 it turned out to be one of the most polluted.

Doctors spoke in favor of closing the city and the enterprise as a whole. I can immediately say that their proposal was not even discussed. Everyone understood that this was impossible - the country would have remained without nuclear weapons. All the directors of the factories were unanimous: we can do it on our own.

It was the first major accident. Pripyat and Chernobyl happened much later. By the way, I think that the zone, of course, is needed at Chernobyl, but the city of Pripyat could have been completely cleaned and saved. Had started decontamination work from the very beginning, but first - to make such a decision. As it was done in the year 57 in Ozersk. Then the work was planned clearly, and therefore it was possible to secure the territory in a fairly short time. But that's my personal opinion.

- Why is this experience not used in Chernobyl?

- In coordination with Moscow, or even as directed, from there all the work was done under the heading "owls." secret. " We gave a non-disclosure subscription, strangers were not involved in the works on the territory of the plant. Until the end of the 80s the secrecy was not filmed, he acted. This did not allow to fully use the experience of liquidation of the accident at "Mayak" in Chernobyl.

- After "Mayak" there was another, no less legendary Object - I mean "Krasnoyarsk-26".

- The number of reactors and radiochemical plants was calculated in such a way as to produce a sufficient amount of nuclear ammunition. From this point of view, the appearance of the complex near Krasnoyarsk is justified. However, no documents about who had the idea to climb the mountain, did not survive. It can be assumed why it was decided to create everything underground. It was already known by the example of Hiroshima and Nagasaki, how great is the power of atomic weapons. That is what determined the fate of the project. It was necessary to build a plant that would be protected from a direct nuclear strike. A great impression was made on the leadership, in particular, on Beria, the underground factories of the FAA missiles in Germany. In the spurs of the Sayan Mountains in the Krasnoyarsk Territory, the site for such an unusual construction was chosen.

I got there in 1965, having already worked for four years as a chief engineer at a plant in Chelyabinsk-40 and, as an ideologue of this reconstruction, being awarded the Order of Lenin. It was then that they decided to transfer me to Krasnoyarsk. We went down with the director of the plant Meshkov for the first time into the mine. Water, trucks with rock scurry back and forth, wires hang. It was December. Workers go underground in boots. Cold, damp, gloomy ... In general, the usual picture of the mine for that time. Three reactors were operating there - an underground nuclear power plant. And what is typical for nuclear scientists? Clean and tidy facility. So we began gradually to turn the mine into a unique structure, which was not equal in the world ... But it was not possible to fully realize my ideas, because later Meshkov was recalled to Moscow and appointed head of department, and I changed him as director. And then I began to engage in not only the mine, but also the city. It turned out the most beautiful of all ten closed cities of Sredmash. This is a common opinion.

Krasnoyarsk-26 is a unique structure. Once the minister, Efim Pavlovich Slavsky, having examined everything, said: "as a metro, even better than the Moscow metro!" Of course, he was somewhat exaggerated, nevertheless the comparison has a right to exist. It was not only interesting to work, but also pleasant ...

"But now everything that was done underground turned out to be unnecessary?"

- In the nuclear industry there is always a problem: what then when the object stops working? In Zheleznogorsk, this is the "Mountain" problem, as the mines later began to be called. In scale, the Mountain was larger than the Moscow metro at that time. It requires constant maintenance - pumping water, ventilation. Necessary lighting. And so on. Three reactors stopped. Dismantled all that is possible. The rest of the equipment needs to be buried. A sort of sarcophagus will be made.

- How to use the workings? Or "Mountain" will die?

- There are two workings empty. The other plants in radiochemical plants have four threads each, and there are only two. There are huge workings. The miners say that in the world no one has made such workings. It is 60 meters high and 500 meters long. Imagine ?! Mine workings have one feature. She even looks fantastic. Production is compressed. The breed tries to eliminate its wound. Collapse should be prevented.

- And now what to do in "Mountain"?

- Maybe a museum? There is such a proposal ... Now there is placed the production of MOX-fuel, which is necessary for fast neutron reactors. But you need to think about using the "Mountain" - you need fresh ideas and projects.

- Such a department as the Soviet Sredmash need modern Russia?

- In a market economy, such a powerful department cannot be created. Sredmash fulfilled its role by implementing the "Atomic Project of the USSR". It seems to me that he, together with the Soviet Union, is in the past. Nowadays, the development of nuclear energy in Russia is called by some "the Nuclear Project No. 2". It is not right. After the war, the "Atomic Project" was implemented by the whole country. Yes, poor, yes, bloodless, but mighty with her people ...

The `Master' of the Secret Cities;

Chief of the Minatom of Russia Main Scientific-Technological Administration on the Fate of Plutonium, Weapons Uranium, and on the Future of Closed Nuclear Centers

Moscow DELOVOY MIR, 18 Feb 95 p 10

Source : [HI0003][GDrive]

Interview with Yevgeniy Mikerin, chief of the Minatom [Ministry of Atomic Energy] Main Scientific-Technological Administration, conducted by Vladimir Gubarev

It would seem, the times of secrecy have passed. Previously, the cities, nuclear enterprises, and glavks [main administrations] of the Ministry of Medium-Scale Machine Building were designated only by numbers, which meant little to the outsider. Now all of them have received sonorous names, and finally we have learned that "medium-scale machine building" is none other than the nuclear industry, that the city of Chelyabinsk-40 is the "Mayka" combine, and that Krasnoyarsk-26 and Tomsk-7 are large reactor and radiochemical enterprises. And finally, that "Glavk Mikerina" [Mikerin's main administration] is a scientific-technological administration... And so, what has changed? Why, in fact nothing! The true secrets remain secrets. The closed thematics are still closed, and the tenth floor of the famous nuclear department on Bolshaya Ordynka is still inaccessible to outsiders. And I believe that this is for the better, because we should not share true secrets. They have been, are and always will be the property of the Homeland, because the people have invested not only huge material wealth in them, but also intellectual. To give them away for "the pittance of a few dollars" would be a crime (unfortunately, we are often seeing this today). And I am heartened by the fact that there are people who understand perfectly well that the numerous visits to our country by foreign colleagues have primarily one goal: To find out how things are going at our nuclear enterprises, to see with their own eyes the original technical resolutions, of which we have many. Today it is a recognized fact throughout the world, including also by USA specialists, that in very many parameters our nuclear industry surpasses the American, and that our radiochemical combines are much more effective and safe. I repeat: This is not our conclusion, but that of the Americans. And therefore, they are ready to engage in the broadest cooperation with Russia in this field. Well, of course, with benefit for themselves.

Yevgeniy Ilyich Mikerin heads up the ministry's main administration, which oversees and, as they say, "treats," half of the closed nuclear cities of Russia. All except those where nuclear weapons are developed and where they are series manufactured. And therefore, our conversation with Yevgeniy Ilyich began with my saying:

Correspondent: You are perhaps the most mighty man in Russia. After all, without you it would be impossible to develop nuclear weapons. Without you, the nuclear power plants could not operate...

Mikerin: Our main concern today is disarmament.

Correspondent: Why?

Mikerin: The main difficulties of disarmament fall not on those enterprises which developed and manufactured the components of nuclear weapons. These problems are associated not so much with the dismantling of the weapons themselves, as with the application of that which we obtain after this. And primarily those fissionable materials which had been produced for decades. And now we must remove them from the weapons and ensure their storage in a very skilled manner, or rather--not so much their storage as their application for the needs of man. And once again, the entire weight falls on those enterprises where the people, with the sweat of their brow and without a thought for their own lives, worked day and night to fulfill the state plans, the very large-scale, intensive and expensive plans for creation of the components of nuclear weapons. Now these same people are engaged in dismantling, and do not know what to do with what they get. Not in the sense of how to store it, but rather of how to utilize it for the current economy. And this is already a tragedy.

Correspondent: Let us assume, we have a nuclear warhead. What percentage of its parts and components can be utilized today?

Mikerin: In principle, it can all be used for developing a new nuclear weapon, but that is not the task of the present day. After all, we are sharply reducing the number of warheads. Therefore, we must think about where to send the materials after dismantling, so as to make use of them. The fissionable materials, and this is highly enriched uranium and plutonium, are suitable in one way or another for use in nuclear power production as fuel. This concerns primarily uranium. In a nuclear weapon, we use highly enriched uranium, with concentration of over 90 percent. Naturally, by diluting it, for example, with natural uranium, we can make it of low concentration. This is approximately the same as processing a certain amount of butter back into milk. Moreover, our reserves of this "milk" are quite sufficient... Please excuse such a household comparison, but it reflects the real state of affairs... Let us take the initial state, from which at one time and at great expenditure, both material and intellectual, we obtained highly enriched uranium. And now, during the reverse process, the losses of such a colossal labor are inevitable, labor which went for obtaining the conditioned uranium-235 by isotopes. Now we are de-concentrating it, turning it into low concentration... But this is also expensive! And not less expensive, but even more so. Plus, there are the losses of labor, resources and intellect. And it is specifically the "intellect" which is the saddest of all, because to make "butter" of such high condition was extraordinarily difficult.

Correspondent: And what about the plutonium?

Mikerin: With this, of course, the situation is even worse. Unfortunately, neither domestic nor world industry today are ready to utilize this material as fuel for nuclear power plants. It is necessary to conduct extensive scientific studies and bench testing of the heat-emitting assemblies, to develop regimens of operation of the active zone of the reactors. With plutonium we are still at the initial stages. It is true, in Europe a mixed uranium-plutonium fuel is rather widely used, but we are speaking here about plutonium which is obtained in commercial nuclear reactors and is isolated during the processing of fuel. Its isotope composition is entirely different as compared with our weapons plutonium--no one has ever really worked with it yet. First of all, no one has had any of it and, secondly, the thinking was oriented only toward using it in weapons. Therefore, this is a new direction of activity for scientists, designers and reactor builders. I believe that weapons plutonium will have to lie around, be stored, for about 10 or 15 years. And the main task is its protection, both from the standpoint of its radiation safety, and from the standpoint of its non-distribution. After all, this is a very "powerful" material from the standpoint of its power resource, and it has a low critical mass. Therefore, any actions--even accidental ones--by which this critical mass may be realized are not permissible. We need methods of separating this material, placing it in special containers which would prevent the possibility of occurrence of a chain reaction and, of course, special monitoring of its storage. Specifically, a large amount of thermal energy is emitted, and it must be released. And insufficient air tightness of the container in which it is placed may lead to the formation of various oxide compounds, and so forth, which is very dangerous. Therefore, there are special means of storage, special tare, containers and equipment for storing plutonium. Naturally, all of this is very expensive.

Correspondent: Can you say that we have resolved the problem of storage?

Mikerin: If we speak of the problem in its "pure form," then, of course, it has been resolved.

Correspondent: What do you mean? After all, there is a great deal of concern throughout the world...

Mikerin: Both in America and in our country, there are containers which reliably protect both uranium and plutonium under all physical effects which one can imagine...

Correspondent: Does this include accidents?

Mikerin: Accidents, airplane crashes, unsanctioned explosions of some devices, and so forth... And naturally, the containers which protect the personnel servicing the storage facility against ionizing radiation. In general, the problems of storage are well known, the appropriate devices exist, but it is necessary to build modern storage facilities. They are lacking. Both in our country and in America. I am speaking about the two countries which possess 95 percent of all the fissionable materials. The mobilization of considerable material resources is needed to create storage facilities. After all, it is necessary to store both uranium and plutonium reliably and for a very long time. Today "a threat" of great expenditures hangs over the country, if we may say so. Unfortunately, there is a catastrophic shortage of resources in Russia, but the system of storage facilities must nevertheless be developed, as long as we have agreed to global disarmament.

Correspondent: And why did you not tell the politicians who were making this decision on "avalanche" disarmament about such a prospect?

Mikerin: I believe it is not necessary to explain this to anyone--the problem is obvious! When a house is being dismantled, there is a pile of material formed, both useful and useless--is that not so? And therefore, before making the decision to dismantle a house, it is necessary to think about what to do with the bricks, boards, iron and rubbish. One does not have to be a very deep thinker to understand the need for utilization of all that is placed into a nuclear warhead. But those who were making the decision on disarmament thought very little about this. And they did not ask anyone! I am convinced that the politicians did not even ask those who ensure the security of our state... I am referring to the owners of the nuclear weapons, i.e., the Ministry of Defense.

Correspondent: A strange situation... For decades, we spoke of nuclear armament--and at that time they consulted with you. I am referring to Minsredmash. You were asked: "Can you do it, or not?"...

Mikerin: We always answered: "We can, but..." And then we said that, in order to do it, we would need this and this and this... And most often the state met us halfway.

Correspondent: Let us depart somewhat from this situation. Let us talk about you, about how you began, how you came to the nuclear industry?

Mikerin: After graduating from the Moscow Institute of Precision Chemical Technology in '51. A special course on radiochemistry was organized there. Of

course, we did not become specialists, but the general preparation was good. Our group received special training for 2 years to work in the atomic industry. They selected the best students, sent them for re-training, and then placed them one-on-one with the new technology, which was secret, encoded, and unintelligible. And so we began mastering the new field...

Correspondent: You worked at the first, second or third plant?

Mikerin: It was called the "25th Plant," for processing irradiated nuclear fuel. I did not work with the reactor--it was primarily the physicists who worked there. But radiochemistry--the most "thankless" part of the chain--we got the difficult task of processing the fuel, purifying it of all the isotopes, obtaining plutonium in pure form, and isolating uranium for its repeat application. Well, and of course, removing various by-products which are formed in the process. This was called the "25th Facility," which was built by inspiration, by individual rumor, or more precisely--by intelligence, and by the experiences of laboratory scientists. It was a "facility" without sufficient protection against radiation, without a thorough knowledge of technology. We proceeded by the method of trial and error. And naturally, there was a constant turnover of personnel, because after receiving a certain dose of radiation, it was no longer possible to work there. It was a unique sort of "mill"...

Correspondent: And how long were you at this "mill?"

Mikerin: Four years. That is a rather long time for that very "dirty" type of production. Sometimes in a day we received as much as is today the standard exposure for a year. Moreover, this occurred in the normal situation, not in an emergency.

Correspondent: And did that happen too?

Mikerin: Of course... I might add, we are talking about external radiation. At that time, we never even guessed about internal radiation. After all, there were neither the means nor the methods of control. They were developed gradually. I might add, knowing very well those who worked at the "25th Facility," I understand that most of them were afflicted specifically not by the external radiation, but by the aerosols, which contained uranium, and especially plutonium.

Correspondent: Who is left alive today?

Mikerin: Not many... And of our teachers, perhaps, no one is left.

Correspondent: Did you know that you would soon be replaced in production. Were you frightened?

Mikerin: No. That was not my personal feeling. I began working as shift foreman, and I had 25-30 people under me. Workers, operators, fitters, instrument men... None of us spent much time thinking about radiation, and we had little concern for protecting our health. At that time, the words "necessary," and sometimes, "necessary at any cost," were the main thing for us, and this brought people together... After all, the war had just ended, and we had all been raised on examples of that gigantic war which we had just experienced. The feats of our soldiers, our entire people... And here in production, they were not even shooting at us, and so it seemed less dangerous...

Correspondent: Did you know what you were doing?

Mikerin: Yes. We knew that we were obtaining plutonium for a nuclear weapon, and were monitoring it until testing.

Correspondent: And after the "mill?"

Mikerin: After 4 years, the construction of a new plant began. The so-called "35th Facility." By order of the doctors, I already had to leave, and therefore I was transferred to the group dealing with the construction of this facility. Here I was able to utilize in full measure the experience which I had obtained in prior years. Even before the start-up of the "35th," we had re-organized both its technology and its equipment. We expended much effort to see that the new plant was up-to-date and safe, so that there would not be a single one of the "dirty things" which we had encountered at the old enterprises. "We" at first consisted of around 20 people, and then there were already around 100 specialists... Our primary efforts were aimed at not permitting any effect of radiation on the personnel. We had to make the people safe from the gigantic radiation field, and we were able to accomplish this. To this day, I am proud that we were able to solve this problem.

Correspondent: How was this expressed?

Mikerin: We employed a new arrangement of the plant, created reliable protection, the technological process was equipped with good instrument control, and there was an automated control system... We were able to realize the basic principle: Radioactive chemical production must be reliably protected against man.

Correspondent: Is the "35th" operating to this day?

Mikerin: No, the plant has already been closed. Not because it had outlived its resource, but because plutonium is no longer needed now... Altogether, there were three radioactive chemical plants built with the new arrangement, with the new equipment, with the new systems of control and management. At Chelyabinsk-40, at Tomsk-7, and later at Krasnoyarsk-26. When we began cutting back the production of plutonium in the late 80's, they shut down the reactors and the first plant in Chelyabinsk, where all the technology had been developed. But we are still proud of the fact that, in all the time of its operation, not one person got a single dose of radiation which would lead to any work-related illness.

Correspondent: You mean there was not a single case?

Mikerin: In the process of normal operation of the plant--no. Of course, I am not counting the accident situations. Naturally, the participants in the liquidation of some accidents received increased doses... And there was one other exception. At the terminal section, where the plutonium was already obtained and from where it went to the metallurgical plant, the radiation norms of the personnel were higher. But even there, excessive radiation above the norm did not occur, and there was not a single case of a "work-related" illness. The control was very strict, monitoring of internal radiation was performed very carefully, and therefore at the recommendation of doctors a person was transferred to a less dangerous or totally safe sector of work.

Correspondent: Did this system operate strictly?

Mikerin: It depended on the people. And since the human factor always existed, there were some exceptions. Generally among the managers, who sometimes knowingly exposed themselves to excessive radiation for the sake of the cause--their responsibility was always too great. But on the whole, the system of control and safety operated strictly.

Correspondent: And how did your fate turn out later?

Mikerin: When the plant in Krasnoyarsk was placed in operation, I was offered a transfer there as chief engineer. That was in '65. An "underground combine" was being developed there. Naturally, they needed experienced cadres. Working at the "35th Plant" was very interesting for me. I had invested too much effort and health in the cause. At first I was the chief technologist there, then the chief engineer. In general, the entire technology was in my hands. I might add that I was never interested in administrative work, and therefore I refused various duties which were not associated with technology. There was much to think about, much I will wanted to change and improve at the "35th," and therefore I did not want to transfer to Krasnoyarsk... But Ivan Dmitriyevich Serbin was a member of the party Central Committee. At that time, he was in charge of placement of cadres in our ministry. I met with him three times regarding the new appointment. Twice he let me go in peace, but the last time he said--"it is necessary!" Well and, of course, the question was resolved... And that is where I met Aleksandr Grigoryevich Meshkov, who was appointed as the new combine director. We quickly became friends, understood each other, and I went to Krasnoyarsk. At that time were were both almost 37 years old...

Correspondent: Why was it built underground?! Could it be in case of nuclear war?

Mikerin: The people have a great deal of imagination... Even under Stalin, in the late 40's, the decision was adopted to build such an enterprise. The sector was being developed, and it was believed that three combines were needed: One in the Urals, the second in Tomsk, and the third--in Krasnoyarsk. Considering the specifics of the relief there, someone proposed "digging" into the mountain, excavating it, and locating the entire enterprise for building nuclear weapons there. Then, supposedly, in case of attack on the USSR and on the exposed facilities, they would be put out of commission, but the Krasnoyarsk complex would continue to operate. That is how the situation appeared in those years... I might add, the experience of the war with Germany was taken into consideration. After all, there were underground plants there which manufactured weapons practically until the end of the war. Specifically, those same FAU missiles... And so that is how it was planned: The combine near Krasnoyarsk would ensure the production of nuclear weapons for all cases of war and life. But while the combine was under construction, it became clear that there was no mountain, no depth in the ground which could ensure security. Moreover, it turned out that such a combine would be much more easily put out of operation than a ground level facility. It would be enough to destroy the electrical transmission lines. And an autonomous system of power supply was possible only for maintaining viability, but not for production. No energy--and the combine turns into a monument.

Correspondent: And an atom bomb is not needed?

Mikerin: Exactly! It would be enough to have paratroopers and a small group of trained professional persons... But in terms of expenditures, this combine was much more expensive that its brothers. It is enough to say that the volume of soil excavated (we computed this in the late 60's) was greater than in the Moscow metro. And plus, under conditions of very difficult rock and soil formations--granites and gneisses. The manpower required was tremendous--miners, metro builders, soldiers, and prisoners... Nevertheless, the combine was built!

Correspondent: And now this combine must cease operation!

Mikerin: It has practically ceased operation already. One atomic reactor is operating, and only because it is producing heat and electricity.

Correspondent: And what is to be done with this "nuclear mountain?"

Mikerin: The problem with which we began our conversation is much more complex for Krasnoyarsk-26. From the very beginning, it was clear that both the reactors and the radiochemical plant had a limited service life. But what to do with underground giant? Unfortunately, it is still unclear what the future of the "mountain" will be. It is imprudent to locate any civilian production at the primary facilities, because it would be necessary to "scrub" a large amount of equipment and communications--they are contaminated. And the main thing: Why should we go underground with any type of production? After all, operation here is much more expensive than at any analogous above-ground production. Should we make it a storehouse? We could, of course. We might add, part of the production is used for state reserves. But again this is very expensive... After all, you cannot throw away these developments. Nature does not tolerate emptiness. If they are not maintained, they will quickly go out of order.

Correspondent: Perhaps we could store spent nuclear fuel there?

Mikerin: It requires so-called permanent storage, and this requires the appropriate geological conditions. But the conditions for this are not very favorable at Krasnoyarsk-26. There is too much water there. And also, it is much simpler to build such a storehouse on land.

Correspondent: But, after all, a new plant is being built?

Mikerin: Yes, but it has nothing to do with the "mountain." Our nuclear power engineering is based on the ideology of comprehensive processing of fuel. A plant is needed for this, and it is being erected at Krasnoyarsk-26. I might add, the problem of waste utilization has been resolved there, specifically the deep burial of nuclear waste. Of course, there is much controversy surrounding this method. But I hold the opinion that, as long as we have given rise to nuclear power engineering, we must re-use the spent nuclear fuel and thoroughly and reliably store the by-products.

Correspondent: There was a discussion about the "Big Plant?"

Mikerin: Yes, that is what it is called. The idea of developing nuclear power engineering was planned in large volume, and by the time the AES [nuclear power plants] begin operating at full capacity, the plant in Krasnoyarsk-26 was to be built for processing the spent fuel. But after Chernobyl, the situation changed drastically. The rates of development of nuclear power production declined sharply, but in any case it is necessary to process the fuel elements..

Correspondent: One strong contradiction is always present in your thoughts. On one hand, you are not sorry that you worked your entire life in the nuclear industry, and on the other--we are constantly running into errors and dead ends in its development. How can you reconcile the irreconcilable?

Mikerin: In many ways, these are unrealized hopes and plans. Let us take that very same Krasnoyarsk-26. We believed that we would shut down the military reactors, but that in their place, or even on the surface, we would build commercial reactors, i.e., an electrical power plant. And such projects were developed in detail. After all, it was specifically the government which presented us with the task of increasing the capacity of nuclear power production by 10 times! And, naturally, we had to concern ourselves well ahead of time about the entire infrastructure of the sector. And this was done, believe me, in a very rational manner: The military reactors were replaced with civilian ones. This was conversion in real life, and not in slogans. And the construction of the "Big Plant" was, once again, a concern for the future. The city where very skilled cadres live is ready for such work. Unlike the present day, in those days we thought about the future, we cared about it, if you will, we constantly gave it attention. This was the strategic perspective, and not just immediate concerns. The same prospects existed also at Tomsk-7 and Chelyabinsk-40. We intended to change over entirely to nuclear power production.

Correspondent: And would this have been real disarmament?

Mikerin: Of course. And real conversion of that nuclear complex which was developed at Sredmash [Ministry of Medium-Scale Machine Building] over the course of many decades.

Correspondent: What is hindering you in this--after all, at the present time you still have the forces and the cadres?

Mikerin: First of all, it is you--journalists and newspapermen. You have begun stating that nuclear power production has no future. And you have frightened the community so much that now one does not even dare mention nuclear power plants.

Correspondent: The shadow of Chernobyl, how can one forget about it?!

Mikerin: Yes, our fault lies in the fact that we were too casual about the design of the reactors. I am referring to uranium-graphite ones... From the very beginning, the incorrect line was selected--the application of our experience and knowledge of military reactors and their transfer to the civil industry. The error consisted of the fact that we tried to develop cheap reactors. Chernobyl put an end to this erroneous line. Unfortunately, we did not take world experience into consideration, believing that "we were ahead of the whole planet." Such a psychology emerged after the first nuclear power plant, the first ice-breaker. Yet the whole world immediately followed a more reliable and safe path. Nuclear power production must have "its own" reactors, i.e., safer and more reliable than the military ones...

Correspondent: Does this mean that today the understanding of the future has changed, that it appears differently than it did before?

Mikerin: It is in a fog. And for the present not much can be seen. And that is why it is so difficult for us.

Correspondent: You are the master of closed cities. What do you think, how long will this last?

Mikerin: I am in favor of opening them... But the general situation in society in our country hinders us from doing so. Unfortunately, the currents of the criminal structures are great, as are the currents of various occurrences--theft, banditism, criminal groupings. If the country was at the level of the 70's-early 80's, the cities would have to be opened. After all, their closure gives nothing but additional problems. The secrets may be protected quite easily on the local territory of a specific facility. But the people living in the closed cities have become so accustomed to a normal life, to a decent human environment, that today they are asking that their cities not be opened. We held a referendum, and 95 percent of the residents spoke out against it. That was several years ago. But now, I am convinced, the figure would comprise the full 100 percent. So that, for the present time, we cannot open these cities.

Correspondent: Which of the cities in your charge do you like the best?

Mikerin: Krasnoyarsk-26. There I spent the best part of my life. First 4 years as the chief engineer, and then 10 years as director of the combine. As director, I was not so much caught up in developing production as in organizing the life in the city. And I was able to accomplish a lot, and that is why I have become "attached" to it. I am proud of the city, because much effort was put into every prospect, into every street, every house and structure. The city turned out to be convenient and beautiful. At least, that is how it seems to me. I love this city!... And, of course, the production as well. It was the most current. Many good and original ideas were realized there... And I did not want to leave there to go to Moscow.

Correspondent: There are other nuclear powers--the USA, England, France, and China. Do we yield to them?

Mikerin: In China today the technology in the nuclear industry is at the level of the 50's... So that it is best of all to make the comparison with America. Much has been disclosed now, and we know more about each other today. We have the right to be proud that in radiochemistry we have surpassed them, and consequently our productions are not only more effective, but also safer. And in terms of radioactive waste as well--both in quantity and in degree of purification of uranium and plutonium. And the main thing is that we have surpassed them in the problem of burying radioactive waste, in its utilization. In their country it is stored in containers which have long become outdated. They do not have any disposal methods. We have developed methods of deep pumping of waste. Yes, there is controversy surrounding it, but I am ready to defend this method at any level, because I have tested it out on "my own skin" in Krasnoyarsk-26. Two years ago, they even "gasped" when they learned that we were able to reliably bury the military portion of our waste at a depth of 500-800 meters in Tomsk and Krasnoyarsk. There are special strata there--collectors, which have no outlets. The radioactive waste is hidden and held by the soil there, so that for the present time I do not see any more reliable methods. We monitor these strata and see that there is no movement... The Americans have taken a cautious attitude toward this technology. Certainly not because it is bad, but simply because they have tried and failed to develop it... So that our level of military production does not yield to the American. And do not believe those who try to prove otherwise.

Correspondent: And what is the price of all this?

Mikerin: Much less! From the very beginning, the Americans' price for everything, from household needs to the most complex types of production, has exceeded ours many times over. It is characteristic that "a-la Chelyabinsk-40"--Hamford today receives $2 billion a year from the state budget. Yet there are no operating productions there! Reactors are kept there--but they are mothballed. Cleaning of equipment of radiochemical plants is performed there, laboratories of scientists are maintained, which continue to perform research on waste burial. In general, there is no less personnel there than at Chelyabinsk-40. But unlike our center, nothing is produced there. Nevertheless, it takes $2 billion! That is quite a bit...

Correspondent: Wouldn't you like to have a little part of that?

Mikerin: If we had even 10 percent of Hamford--even that would be a great help in solving the problems of rehabilitation of the territories in the region of Chelyabinsk-40. Unfortunately, in our time, we did not find suitable conditions there for underground burial of waste, and therefore we opted for the creation of open reservoirs and enclosed storage facilities. Therefore, a large network of open waste-filled reservoirs emerged at Chelyabinsk-40, including also highly radioactive ones. Everyone knows, specifically, about Lake Karachay. The radioactivity there is high, and there is plutonium and uranium there. Today we are completing the first stage of its burial, covering it over with dirt. This is not easy. An original plan has been developed--first the division of the lake into small check-dams, and then their gradual coverage. There are two reservoirs there--numbers 10 and 11, which contain low-radioactivite waste. The South Urals Nuclear Power Plant was to have been built near them, which would have operated on the evaporation of the reservoirs and on reduction of the activity...

Correspondent: But now everyone agrees that it should be built?!

Mikerin: Several years ago, there was a strong anti-nuclear campaign, and the construction of the nuclear power plant was halted. Time passed, and everyone realized--even the fierce opponents of the plant--that a mistake had been made. The oblast today needs power as much as it needs air, and therefore the administration is appealing to the government with a request to continue construction of the plant. And, it would seem, all the necessary decisions have been adopted, but the plant is not being built. The combine has developed a system of vitrification of the radioactive waste--and all the waste from the fuel

obtained from the nuclear power plant has been vitrified. The glass blocks will be stored for 30 years at Chelyabinsk-40, and then, when the disintegration of the primary isotopes is complete, they will be placed in wells--for permanent storage.

Correspondent: In principle, do you have a specifically defined program of work for all the centers?

Mikerin: Of course. But everything rests on the economy. With a sick economy, the current nuclear industry cannot develop. I understand that time will pass, and the knowledge and experience of the nuclear engineers will necessarily come into demand once again. But today we must preserve the collectives, the experience and the knowledge which were accumulated over the almost half a century of history of nuclear science and industry. And we are trying to do this to the best of our ability.

John L. Mikovits, Sr. dies

Review - Appeal - Dec. 6, 1983 WCHS

John Louis Mikovits, Sr. of Brentwood, 84, died on Wednesday, Nov. 30 at Baptist Hospital after a short illness. A native of Austria, he was the son of the late John L. and Marie Mikovits. He was retired from the Buick Motor Division of the General Motors Division of Flint, Mich.

Survivors are: wife, Mrs. Julia Mikovits, Brentwood; sons, Baldwin Mikovits, Flint, Mich., John L. Mikovits, Jr., Brentwood; nine grandchildren; five great grandchildren.

Services were conducted at the Broadway Chapel of Roesch, Patton, Dorris & Charlton on Saturday, Dec. 3, with the Reverend Bill Wilson officiating. Cryptside services and entombment were conducted on Monday, Dec. 5, at Flint Memorial Park.

Honorary pallbearers were: Jimie Houston, M.A. Currie Andrews, Larry Beadle, Ernest Boyte and William Greenwood. WCHS

—K—

Music filled the dreams of John Mikovits when he came to this country from his native Russia after the World war number one. His fondest hopes were that his two sons, Baldwin, who is now 14, and John, Jr., now 10, should become a success in the musical world. Today his ambitions have been realized. Baldwin has already been acclaimed by such music masters as Fritz Kreisler, Albert Spalding, and others as "the greatest violin prodigy of the modern day." The second son, John, the pianist, made his debut before a critical gathering in Flint a short while ago, where he was instantly pronounced a budding musical genius. The career of the youngsters is as remarkable as it is meteoric, in that Mikovits trained the youngsters personally when he came home from his day's labors at the automobile plant, where he is employed as an expert mechanist on defense production. Mikovits thanks the Lord for the spirit that caused him to come to the United States, "The Land of Opportunity." He is now as loyal an American as the contry contains and is ready to sacrifice his son's musical career to serve the United States in war if need be. It is such stories as this one that warms the blood in the heart of all loyal Americans.

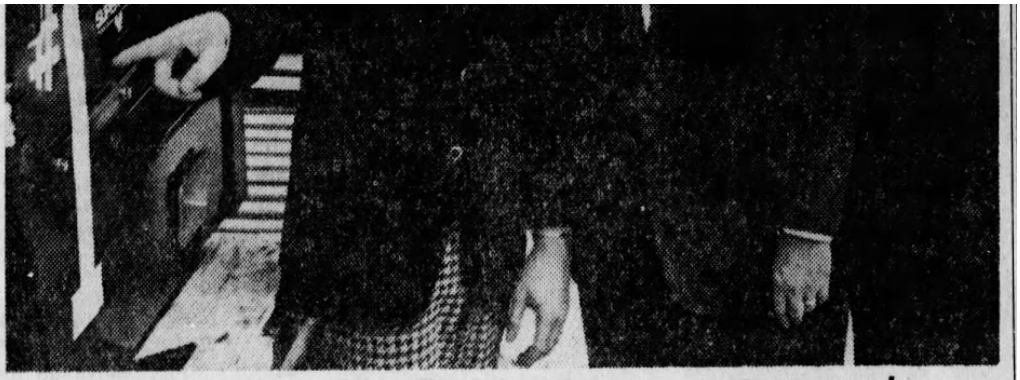
Plant Near Lavergne Rolling

LAVERGNE, Tenn. — The Coats Co. has begun pilot production in its new $2 million plant in Interchange City with 153 employes and just over three months of time elapsed since plans for the 160,000 square-foot plant were announced.

John L. Mikovits, vice president and general manager of the company which produces automobile tire changing equipment and related accessories, said the company will add $1.2 million to the local payroll this year.

HE SAID a three-stage growth plan calls for the addition of 50 employes by next November and another 50 employes by November 1974 when production will be



Wasting No Time Getting Started

LAVERGNE, Tenn. — Viewing the Coats Co. production line for automobile tire changers are, from left, John L. Mikovits, vice president and general manager, Robert A. Hennessy, president of Hennessy Industries, Inc. of Chicago, William Allen, Coats' director of engineering, and Leon Nold, Coats' director of manufacturing.

further diversified in other wheel related equipment.

The industrial division of the Nashville Area Chamber of Commerce has estimated the cash generated by the company's payroll and sales will be about $12 million for the Rutherford-Davidson County economy this year.

Coats, headquartered in Fort Dodge, Iowa, is a subsidiary of Hennessy Industries, Inc. of Chicago, which through its subsidiaries, manufactures and distributes tire changers, service jacks, impact power tools, wheel balancing equipment and weights, tire studs and other similar equipment.

WITH AN initial model of a tire changer rolling off the production line last week, Mikovits said he was "extremely grateful to all those people who have taken a part in getting this facility into operation so quickly."

"I have been involved in locating new plants for many years, and this is the first time that all plans and expectations actually became realities. Everyone involved in this project had a lot to do, knew what they had to do and did it," he said.

Mikovits was complimentary of McDowell Development Corp., general contractor for the plant, and thanked George Barbee, vice president for industrial development for the Nashville Chamber of Commerce for "providing informative material and surveys which made Nashville and Middle Tennessee a logical choice for placing a new distribution plant."

HE SAID five base models of tire changers will be made here initially with daily production expected to reach 200 units.

The Coats market area covers the U.S. and includes parts of Europe and the Far East. The company has three distributors in Nashville and 10 others in Tennessee with a total of about 300 distributors and parts warehouses elsewhere across the nation.

John L. Mikovits, left, and Jack P . Hennessy admire a framed picture of comedian Bob Hope presenting an award to Hennessy for his contributions to international good will and understanding. The award was made by the National Tire Dealers and Retreaders Association to Hennessy, who is president of Hennessy International of Los Angeles, and executive vice president of Hennessy Industries, Inc., of Chicago. The award was presented at the NTDRA's annual convention last fall in Las Vegas. The picture was given to Mikovits and will hang in the executive conference room in the Coats plant at Interchange City.

Management Team Behind The Coats Co.

Just as men have women behind them (or most of them do) who keep them ticking over and making progress, companies have men behind them. They are the men who make the company go — and here are some of the team behind the Coats company.

* * *

John L. Mikovits is vice president of the Coats Company at Nashville, in addition to being general manager.

Mikovits joined Coats Company, a manufacturing facility for the Jack P. Hennessy Company, in 1971. Prior to that he spent 18 years with General Motors as a manufacturing executive.

One of Mikovits' outstanding achievements with Coats was the move of that company's production operations from Fort Dodge to the present expanded plant in Nashville.

Mikovits received his B.S. from General Motors Institute of Technology and his Masters from the University of Detroit. A veteran of the Korean War, he now resides in Nashville with his wife.

* * *

Jack P. Hennessy is president of Hennessy International, 3453 Cahuenga Boulevard, Los Angeles.

Hennessey is a Knight of the Military and Hospitaller Order of St. Lazarus of Jerusalem, and a Commander of the Chevaliers du Tastevin.

He is a member of the board of directors of the National Eye Research Foundation, Chicago; a member of the board of directors of the Los Angeles-Mexico DF Sister City Affiliate; a patron of the Eisenhower Medical Center, Palm Desert, California; chairman of the University of Southern California Parents League; a member of University of Southern California Associates, and a member of the Beverly Hills Wine & Food Society. His club memberships include Lake Side Golf Club, North Hollywood, California; Eldorado Country Club, Palm Desert, California.

Hennessy received his education at the University of Southern California, and at the School of Foreign Service of Georgetown University.

He served as a first lieutenant commanding in World War II and the Korean War.

Hennessy lives in Toluca Lake, California with his wife Shirlee and three children. They are Nancy, at University of Southern California, Mark at Notre Dame High School, and Lizbeth at Immaculate Heart High School.

* * *

Robert A. Hennessy is president of Jack P. Hennessy Industries, Inc. and in charge of finance. He graduated from Georgetown University and received a degree in Business Administration from Columbia University. He also served in the U.S. Navy.

Beginning with Jack Hennessy Sr. in 1954, he opened the first office in Chicago. He was President of Jack P. Hennessy Co. of Illinois in 1955 and when Hennessy bought Coats in 1962, he became president of Jack P. Hennessy Industries.

Hennessy lives in Chicago, Ill., and Lake Geneva, Wis., with his wife. He is a member of the La Quinta Club.

* * *

James D. Hennessy is executive vice president and director of marketing. He is also in charge of the Far East operations.

Hennessy received a law degree from Georgetown University. He was manager of an Arlington Village, Va., land developers' complex prior to joining Hennessy and also served in the Merchant Marine.

He lives in New Jersey with

European Market in Mind

LAVERGNE, Tenn. — Mark P. Hennessy, right, demonstrates the Coats Co.'s new Inter-Continental-Nashville tire changer to Gerhard Dammann of Hamburg, Germany, Bernie Alm of Toronto, Canada, Jack Hennessy of Los Angeles, John L. Mikovits, Coats general plant manager, and George J. Papas of Caracus, Venezuela.

International Flavor Marks Area Firm's Product Show

LAVERGNE, Tenn. — The Coats Co., the world's largest manufacturer of tire changing equipment, showed off its latest model to a delegation of international representatives visiting the company's new plant in Interchange City last week.

Playing host to the visitors was Jack P. Hennessy of Los Angeles, president of Hennessy International of Los Angeles, and executive vice president of Hennessy Industries of Chicago, the parent firm of the Coats Co. which began pilot production here in January.

THE AGENDA of the company's first international group meeting was highlighted by a demonstration of Coats' first new model tire changer designed and built by local personnel at the new plant for sale on the international market.

Hennessy described the changer as "innovative" and said it is designed for initial distribution to the European market since it has the capability to handle European type car wheel rims which have no center holes.

He added that the machine can handle nearly any tire-rim combination without damage to either with particular attention focused on the growing use of sport rims made from chrome, magnesium and other alloys that are highly susceptible to damage in handling during tire-changing operations.

IN COMMENTING on the meeting, Hennesssy said the occasion "signified the company's strength abroad with executives attending from its leading distributors in Europe, Canada and South America.

John L. Mikowvits, Coats has plans for expansion into other wheel-related manufacturing operations and an increase in its work force over the next two years.

Visiting the plant with Hennessy was his son, Mark, representing the family's third generation in the Hennessy organization.

vice president and general manager of the havergne plant, praised the local engineering staff for the design of the equipment adding:

"We are certainly proud of our fine organization and extremely excited about our new home here in Middle Tennessee. We expect even greater things to happen in the future."

THE COATS plant occupies approximately 160,000 square-feet and represents an investment in excess of more than $2 million.

With 250 employes and an annual payroll exceeding $2 million, the plant makes six different base models of tire changers and produces about 200 units a day. The company

Tri Technical more than just engineering firm these days

By LISA LINDENSCHMIDT
Courier Staff Writer

With a history of corporate success under his belt, eight employees and a lot of optimism, John L. Mikovits established Tri Technical Corporation — an engineering firm — in January 1982.

But an engineering firm alone was not what he had in mind, and by October of that year Mikovits had reached an important goal in fulfilling the company name by building Tri Technical Corporation into a three-division company — engineering, construction and manufacturing.

By January 1983 he would reach a second goal by moving the company from Brentwood back to Rutherford County's Interchange City where he feels most at home.

"Work, commitment, dedication and starvation," is how Mikovits described the company's earliest growing pains.

Business was slow in the beginning — it took three months for the firm to get its first engineering contract — but by the end of its first fiscal year in July 1982, Tri Technical had secured $242,000 in business.

That amount would increase tenfold in another year.

This week Mikovits revealed that the General Motors corporation has selected Hofmann Corp. A.S.E. as the single source for GM-branded electronic wheel balancers. The selection includes a GM model LCB to be manufactured by Tri Technical Corp. GM will make formal announcements on Nov. 1.

"Most small companies, if run wisely, can grow very quickly, in an almost doubling effect until they reach a plateau," he explained.

And if Tri Tech's present growth rate indicates its future growth, Mikovits will meet his five-year goal of 100 employees and $10 million in gross sales.

However, it's not the dollar figures which motivate Mikovits, he explained, but a strong desire for achievement and a better quality of life for his employees, the community and himself.

"You need employees who are achievers themselves and who fit into the objective of the company," Mikovits said. "When you enhance learning and achievement, and in turn upgrade the quality of your products and services, a profit will occur and everyone will make money."

Extracting from people what they never thought they had to offer — recognizing the meaning of pulling people together — "that's what management is all about," Mikovits declared, "bringing out the best in people."

An engineer with a history in corporate management, Mikovits was vice president and general manager of the Coats Co. in LaVergne from 1971 until his 1979 move to Nortron, Inc., a subsidiary of Sun Electric Corporation.

Sun constructed the multi-million-dollar Rutherford Assembly Division in 1980 where Mikovits was named president and chief operating officer.

But the plant was closed the following year, a great disappointment, he recalled, and it was then that he turned his energies toward Tri Technical Corporation.

"Tri Technical has three technical divisions which are all operated and managed separately, but together contribute to the corporate objective of growth and profit," Mikovits said.

The company established itself on engineering contracts, but soon after obtaining a state general contractor's license in August 1982 was awarded a construction contract at Avco Aerostructures in Nashville which later earned an outstanding management award for its work on B1 Bomber projects.

A month later, Tri Technical signed a substantial manufacturing contract with the Hofmann Corp., a worldwide manufacturer and distributer of auto service equipment.

"With that contract, all three divisions were up and running," he recalled.

But there was one more adjustment which needed to be made, Mikovits said, and he made it last January when he moved the firm to a 30,000-square-foot facility in Interchange City.

TRI TECHNICAL PRESIDENT JOHN MIKOVITS

"I really feel close to this area," he said. He designed the Coats Co. manufacturing plant in Interchange City when the only other building there was the Firestone plant, the only street was Firestone Boulevard and it was not yet paved. Mikovits also designed the Sun Electric plant which stands in Interhcange City East.

And now he has plans — in color, framed and on his wall — for a new 80,000-square-foot Tri Technical Corporation facility in his Interchange City home base. "Our plan is to begin construction in the park by next July," he said. "It'll be our own facility — the foundation for some very ambitious grwoth."

Building Tri Tech into a household word in the neighborhood, as Nissan has come to be, is part of that ambition, Mikovits said. "As Nissan grows, we can be part of that growth and complement it."

The firm has been awarded many contracts at Nissan, ranging from the installation of 54 frame line robots to the mechanical and electric installation of overhead conveyors. Tri Tech engineers still serve Nissan during their startup period.

The firm also has had contracts with NKC of America, OTC of America, Teledyne, Ingersoll and others. Having recently constructed Huff's Bi-Rite supermarket in Brentwood, the firm is now bidding several projects and negotiating other substantial contracts, Mikovits said.

Tri Technical now employees more than 40 people.

Business News

LaVergne company is truly high tech

By KAREN McCOLLUM
News Journal Staff Writer

LAVERGNE — High technology in Rutherford County has reached new heights — and ventured into outer space — with the launching of a $1.5 million space shuttle contract by Tri Technical Corp.

During the recent dedication ceremony for Tri Tech's new plant facilities on Southway Boulevard, president John L. Mikovits announced the landing of a $1.5 million space shuttle contract with Gates Learjet Corp. and the acquisition of Mid-South Drywall Company of Madison.

"We are honored and delighted to have been chosen by Gates Learjet from amongst the stiffest hi-tech competition in the country," he said. "It's great for Tri Tech's people, the city of LaVergne and the state of Tennessee."

The ceremony marked the company's success story, rising in 3½ years from "a clean piece of paper to $7 million in gross sales for this fiscal year," he told the 150 employees and guests who attended the dinner and dedication.

Partitioned off from the band, chorus and guests seated at tables covered with white linen cloths, were numerous blue wheel balancers Tri Tech employees had manufactured only days before.

"The story began November 1981 with the shutdown of Sun Electric," he explained to guests seated in the plant.

Over 250 employees lost their jobs. Marvin Runyon, president of Nissan Motor Manufacturing Corp. U.S.A. in Smyrna, and guest of honor, agreed to evaluate and eventually hired over 100 of those people.

Since that time, Mikovits said, Tri Tech has performed numerous jobs for Nissan and other firms, establishing itself "firmly in the engineering, construction, manufacturing and now aerospace divisions" of industry.

On May 15, Mikovits said, he purchased the outstanding stock in Mid-South Drywall Company.

"Mid-South Drywall ranks among the top drywall companies in the country, specializing in hospital and high rise subcontract construction and renovation. Our work carries us through many states from Florida to the state of Washington," he said.

In addition he announced the following staff promotions: John Mikovits, president, Tri Technical Corp. and Mid-South Drywall Co.; Gene W. Pierce, senior vice president, Tri Technical Corp.; C. Clayton King, vice president, construction division, Tri Technical Corp.; James R. Pierrot, vice president, engineering-aerospace division, Tri Technical Corp.; Steve Gedelman, vice president, Mid-South Drywall Co.

Mikovits said the company will share Tri Tech's new plant facilities at 144 Southway Blvd., adjacent to Interchange City in LaVergne.

With the landing of the space shuttle contract, the new facilities must already be expanded. And on Aug. 12 workers broke ground in readiness for the new project.

Mikovits estimates it will take 60 days to complete and they will add about 14,000 square feet to the present 28,000 square-foot facility.

The equipment to be housed in the new two-story low bay will stand 20 feet tall, 60 feet long, 38 feet deep and will weigh approximately 40 tons, taking nearly 50 weeks to build, he explained.

The equipment, a computer-controlled CRT 400-CNC, was specifically designed for fastening fuel tank panels for the booster rockets, which will propel the space shuttle into its final orbit.

Mikovits told the audience the company's progress and growth was only possible through the Tri Tech employees.

"The people of Tri Tech made it happen against all odds," he said, "growing from six to 65 permanent and 130 temporary employees, from a clean piece of paper to $7 million in gross sales."

For that reason, he asked Runyon to present the company's dedication plaque to the two most senior hourly employees. The inscription on the plaque read, "To all employees of Tri Tech, whose loyalty and commitment made it possible."

Runyon told the audience that the company's accomplishment of the past 3½ years "speaks for itself."

"I knew he had the right stuff to make this company grow," Runyon said. "People are this company's valuable resource."

In addition, Runyon also presented 21 Tri Tech employees with employee-of-the-year plaques.

Mayor Vester Waldron presented Mikovits with the key to the city.

"Thanks to you and your staff and your foresight in LaVergne, LaVergne is now known as high-tech Tri Tech country," Waldron told Mikovits.

During the ceremony, Mikovits presented Runyon, this year's chairman of United Way in Nashville, with a check for $11,111.11.

"John L. Mikovits is listed as a President, Director with Mid-South Drywall Company, Inc. in Florida. The address on file for this person is 401 Granny Whitepike, Brentwood, TN. The company is a Florida Foreign Profit Corporation, which was filed on March 13, 1986. The filing status is listed as Inactive. The address on file for this company is 144 Southway Blvd., Lavergne, FL 37086-3614 in Rutherford County. The Registered Agent of record is C T Corporation System "

2019 (Jan 22) - Passing of wife Gloria Furr-Fornshill

PDF - at [HL003X][GDrive]

November 16, 1936 - January 22, 2019 (82 years old)

Here is Gloria Furr-Fornshill's obituary. Please accept Everhere's sincere condolences.

We are sad to announce that on January 22, 2019, at the age of 82, Gloria Furr-Fornshill (Frederick, Maryland), born in Washington, District of Columbia passed away. Family and friends are welcome to leave their condolences on this memorial page and share them with the family.

She was predeceased by : her parents, Edward M. Furr and Hazel I. Willis. She is survived by : her spouse **Kenneth B. Fornshill**; her children, **Judy Nolde** of Carlsbad, CA, **Julie Hirka** of Vienna, VA, **Karen Reid** of Dickerson, MD and **John Mikovits** of Cape Coral, FL; and her siblings, **Gary Furr** of Raleigh, NC and Jeannette Beard of Frederick, MD.. She is also survived by eight Grandchildren, three Great Grandchildren.

Judy Anne Mikovits (c. 1958) is an American anti-vaccination activist, conspiracy theorist, and former medical researcher. She has made several claims regarding vaccines, coronavirus, and chronic fatigue syndrome (CFS). As research director of CFS research organization Whittemore Peterson Institute (WPI) from 2006-2011, Mikovits led a research effort that reported in 2009 that a retrovirus known as xenotropic murine leukemia virus-related virus (XMRV) was associated with CFS and may have had a causal role. However, the research came under fire, leading to an eventual retraction on December 22, 2011, by the journal *Science*.[8] In November 2011, she was arrested and held on charges that she stole from WPI, but she was released after 5 days and the charges were later dropped. In 2020, Mikovits drew attention online for promoting conspiracy theories about the COVID-19 pandemic that were fact-checked and found to be either false or not based on scientific evidence.

Education

In 1980, Mikovits was awarded a Bachelor of Science degree in chemistry with a specialization in biology at the University of Virginia. After graduation, she went to the National Cancer Institute in Frederick, Maryland, where she developed purification methods for interferon alpha. In 1986–1987, she started working at Upjohn Pharmaceuticals in Kalamazoo, Michigan, working to develop production methods to ensure biological materials manufactured using human blood products were free of contamination from HIV-1. In 1992 she completed a joint PhD program in biochemistry and molecular biology at George Washington University.[13] Her PhD thesis was titled *"Negative Regulation of HIV Expression in Monocytes."* Mikovits was a postdoctoral scholar in molecular virology at the Laboratory of Genomic Diversity, National Cancer Institute, under Dr. David Derse.

Early career

Mikovits worked for Francis "Frank" Ruscetti at the National Cancer Institute in Maryland during the 1980s. She remained in his lab as a postdoctoral researcher. Her work with Ruscetti included studies of several retroviruses and their interactions with the immune system.

XMRV and CFS

Harvey Whittemore and his wife Annette were frustrated by lack of answers for CFS patients, including their daughter. In an effort to solve the CFS problem, they created the Whittemore Peterson Institute in 2005; Mikovits became the research director in 2006. Attempts to find a viral cause of CFS were unsuccessful.[16]

In 2007, Mikovits met a co-discoverer of XMRV, Robert Silverman, at a conference. Silverman had found XMRV sequences, which are highly similar to mouse genomic sequences, in prostate cancer specimens several years earlier. Using tools obtained from Silverman, Mikovits began to look for XMRV in her CFS samples. In late 2008, a graduate student, who subsequently was hired as her technician, obtained two positive results from a group of twenty samples. He and Mikovits successively altered the experimental conditions until all samples gave a positive signal.[16]

In 2009, Mikovits and co-workers reported in the journal *Science* that they had detected XMRV DNA in CFS patients and control subjects. Negative results were published soon after, disputing Mikovits's findings. Silverman, who was a co-author of the original XMRV-CFS article, told the Chicago Tribune that he was "concerned about lab contamination, despite our best efforts to avoid it."

Two of the original authors of this paper subsequently reanalyzed the samples used in the research and found that the samples were contaminated with XMRV plasmid DNA, leading them to publish a partial retraction of their original results.[20] In December 2011, after a request by first author Robert Silverman, the editors of *Science* retracted the paper in its entirety.[21][22]

Lo and Alter, in their 2010 paper titled "Detection of MLV-related virus gene sequences in blood of patients with chronic fatigue syndrome and healthy blood donors", stated "Although we find evidence of a broader group of MLV-related viruses, rather than just XMRV, in patients with CFS and healthy blood donors, our results clearly support the central argument by Lombardi et al. that MLV-related viruses are associated with CFS and are present in some blood donors." This paper was also later retracted by the authors.

In either September or October 2011, Mikovits was terminated by the WPI due to disputes over the control of lab samples and the integrity of her work; she subsequently came under investigation for alleged manipulation of data in her publications related to XMRV. On November 18, 2011, she was arrested in her Ventura County, California, home and jailed for 5 days based on WPI's allegations that she stole lab notebooks, a computer, and other material. She was held temporarily pursuant to that case, and her lawyer said the charges had no merit. By November 28, after negotiations with the WPI, some lab notes were returned. Later, the criminal charges brought against Mikovits by Washoe County, Nevada, were dismissed by the District Attorney and Assistant District Attorney in Reno, Nevada.

Mikovits and collaborators went on to participate, alongside two other research groups, in a larger 2012 study with 147 CFS patients and 146 controls. The study concluded that there was no evidence of XMRV or MLV infection in either group, a result that Mikovits said was "the definitive answer" on the issue.

Anti-vaccination activism and conspiracy theories

Mikovits has become a champion for believers in medical conspiracy theories, basing claims linking the XMRV to autism and cancer on other retracted papers, and claiming she had been jailed by the influence of the deep state and Big Pharma. This final claim refers to her arrest in 2011 for allegedly stealing materials from WPI.

Mikovits has spoken at a number of anti-vaccination events. She has claimed that retroviruses have contaminated 30% of vaccines.

Mikovits has garnered criticism from scientists for stating that XMRV is a communicable infection which is "clearly circulating through the population, as is our fear and your fear". Virologist Vincent Racaniello said that Mikovits's assertion "is just inciting fear." Mikovits showed slides at a conference linking XMRV to Parkinson's disease, autism and multiple sclerosis. However, there is no published evidence that XMRV is associated with these diseases.

Coronavirus conspiracy theories

Mikovits gained attention on social media for promoting her ideas about the COVID-19 pandemic. She does not believe that a vaccine is needed to prevent COVID-19, and claims that the coronavirus was "caused by a bad strain of flu vaccine that was circulating between 2013 and 2015". She also claimed masks will “activate” the virus and reinfect a mask-wearer over and over. One of her videos about the coronavirus pandemic was fact-checked by the website Maldita.es, which rated the claims she made as either false or not based on evidence. The *Republic World* website also fact-checked her claim that the global health system uses vaccines as weapons to make profits, judging that the claim was false. *Politifact* described the video as "a deep dive into conspiracy theories about COVID-19, public health and the pharmaceutical industry." *The Daily Beast* reported that "experts say the allegations Mikovits lays out in the interview with Willis don’t stand up to the slightest scrutiny".

One such circulating video gained notoriety in May 2020. Titled *Plandemic Part 1*, this film is a half-hour long documentary-styled interview of Mikovits's perspective on the accusations thrown upon her by the WPI. YouTube removed this video from its website a number of times, citing its Community Guidelines. It was later removed by Vimeo and Facebook for similar reasons. David Gorski reviewed the video for his blog and remarked that "the amount of nonsense, misinformation, disinformation, and conspiracy mongering in Mikovits’ response to questions is truly epic."

Bulletin Board

Big Brothers/Big Sisters appreciation luncheon Jan. 24

The fifth annual appreciation lunch of Big Brothers/Big Sisters will be held Sunday, Jan. 24 at the Sheraton Inn at 12:30 p.m. All active Big Brothers/Big Sisters, Little Brothers/Little Sisters and board members are invited. There is no charge. Potential Big Brothers/Big Sisters accompanied by active BB /BS will have an opportunity to get to know the program.

Barbara Brittain, one of the parents, and Helen Davis, an active Big Sister, will share their experiences. The following Big Brothers/Big Sisters will receive various awards:

Cheryl Bingham, Connie Caffes, Gerry Chipman, Helen Davis, Elizabeth Jones, Rose Lechner, George Blickenstaff, David Denton Jr., Diana Colliflower, Wanda Edens, Lisa Farbstein, Camille Kime, Barbara Mims, Sandra Motichak, Mary Pat Peace, Patricia Pearl, Susan Welcos, Charles Cathey, Michael Fluellen, Steve Giardina, Charles Guarino, Alfred Mayne, Paul Smoot, Dave Wilkinson, William Berg, Cathy Brittain, Mary Pat Dougherty, Terry Galloway, Dorothy Garland, Lori Grimes, Carol Humberson, Lorian Kropp, Julie Nicklin, Gail Padgett, Carolyn Wheeler, David Carney, Vince Coates, Michael Delaney, Gary Devilbliss, Donald Dougherty, Richard Hamelin, William Kuhn Jr., Benjamin Raugh, Richard Schneider, Paul Stronza, Jean Witt, David Beliliotti, Warren Harrison, Greg Kerr, Judy Mikovits, Christine Tresselt.

For further information and how you can get involved in the program, call 694-9455.

1990 (March 1) - Runner

Full newspaper page - [HN00S3][GDrive]

Steeplechasers

1990-03-01-frederick-news-post-pg-c-3-clip-steeplechase

Ruth Riemschneider, a runner with the Frederick Steeplechasers Running Club, recently won the women's division of the RRCA championships, held at Howard Community College in Columbia.

Riemschneider covered the 8-kilometer course in 1:04:00 while Karen Hawthorne was seventh (1:09:23). Other top women runners for the local club include Nancy Walz, 12th (1:11:32); Judy Mikovits, 28th (1:24:39); Laurie Widmer, 29th (1:24:46); and Rose Lechner, 41st (1:36:45).

Rusty Moore was the top men's finisher for the Steeplechasers, finishing eighth with a time of 54:25. Other top Steeplechaser runners in the race were Doug MacDonald, 15th (56:46); David Dia, 38th (1:01:09); Tom Thornhill, 40th (1:01:15); Tim O'Keefe, 41st (1:01:22); Corky Campbell, 46th (1:02:12); Tim Briscoe, 51st (1:03:23); Hal Carrier, 65th (1:05:39); Bob Imming, 68th (1:06:11); and Joe Tiso, 75th (1:07:05).

As a team, the Steeplechasers finished fourth overall.

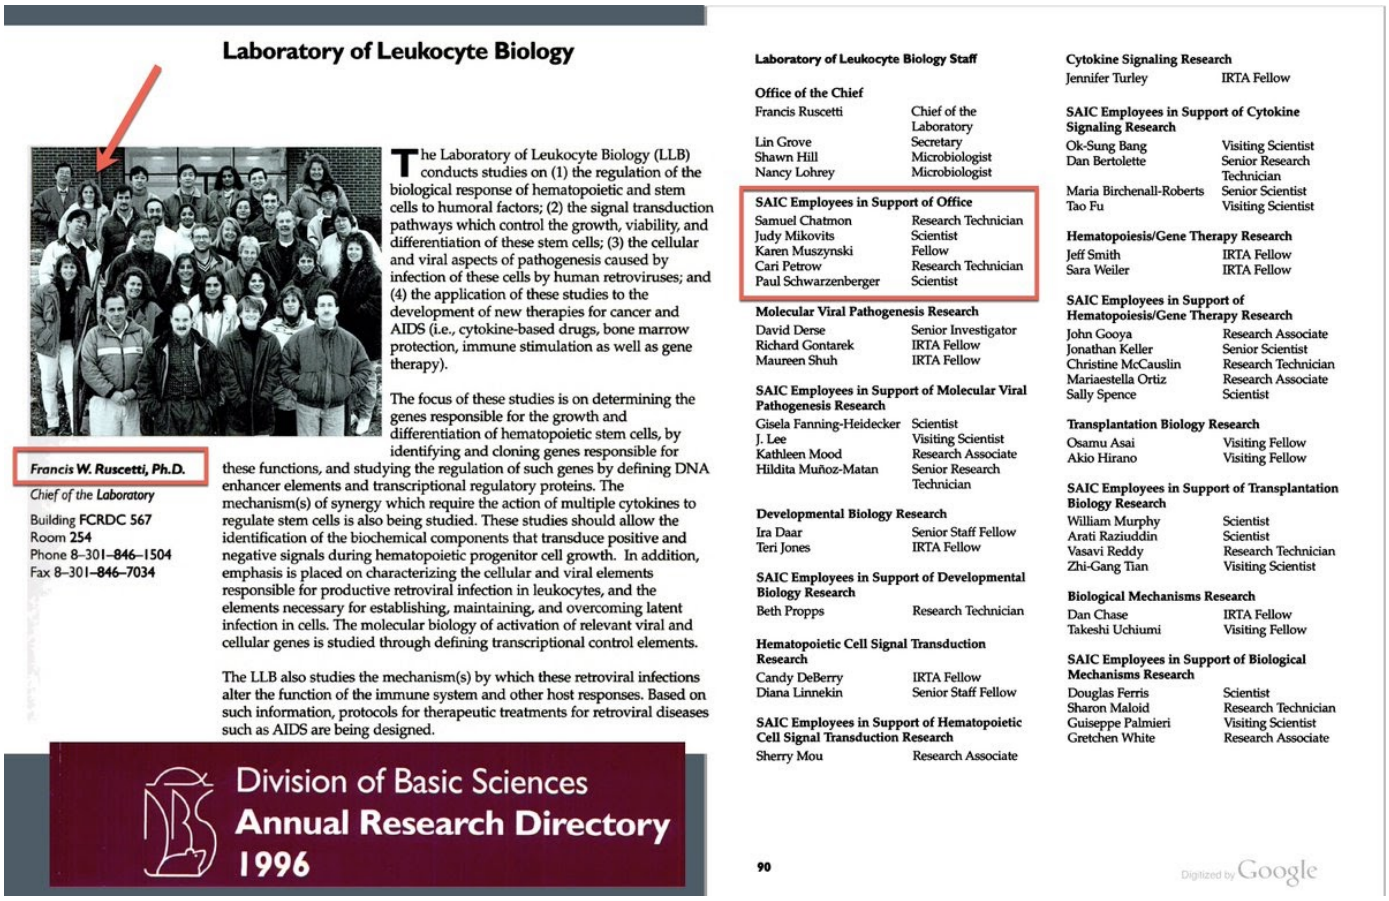
July 20, 1993 - Vince Foster suicide

Deputy White House counsel **Vincent W. Foster** was found dead in Fort Marcy Park off the George Washington Parkway in Virginia, outside Washington, D.C., on July 20, 1993. His death was ruled a suicide by five official investigations.

The body was found by the step-brother of Judy Mikovits .

1996 - Mikovits is with SAIC in 1996, reporting to the NCI

Tweet - [HT004W][GDrive]



Laboratory of Leukocyte Biology

The Laboratory of Leukocyte Biology (LLB) conducts studies on (1) the regulation of the biological response of hematopoietic and stem cells to humoral factors; (2) the signal transduction pathways which control the growth, viability, and differentiation of these stem cells; (3) the cellular and viral aspects of pathogenesis caused by infection of these cells by human retroviruses; and (4) the application of these studies to the development of new therapies for cancer and AIDS (i.e., cytokine-based drugs, bone marrow protection, immune stimulation as well as gene therapy).

The focus of these studies is on determining the genes responsible for the growth and differentiation of hematopoietic stem cells, by identifying and cloning genes responsible for these functions, and studying the regulation of such genes by defining DNA enhancer elements and transcriptional regulatory proteins. The mechanism(s) of synergy which require the action of multiple cytokines to regulate stem cells is also being studied. These studies should allow the identification of the biochemical components that transduce positive and negative signals during hematopoietic progenitor cell growth. In addition, emphasis is placed on characterizing the cellular and viral elements responsible for productive retroviral infection in leukocytes, and the elements necessary for establishing, maintaining, and overcoming latent infection in cells. The molecular biology of activation of relevant viral and cellular genes is studied through defining transcriptional control elements.

The LLB also studies the mechanism(s) by which these retroviral infections alter the function of the immune system and other host responses. Based on such information, protocols for therapeutic treatments for retroviral diseases such as AIDS are being designed.

New AAUW officers

1999-09-09-frederick-news-post-pg-a-10-clip-aauw

New officers of the Frederick Branch of the American Association of University Women were recently elected. From left are Ann Pyne, corresponding secretary; Judy Mikovits, program vice president; Frances Flynn, membership vice president; and Sally Spence, president. Not shown is Cindy Houdeshell, recording secretary. The group is sponsoring a book sale to be held Saturday from 10 a.m. to 4 p.m. at the Whittaker Center on the Hood College campus.

Takes role at EpiGenX Pharmaceuticals .

"Judy A. Mikovits, Ph.D., Director of Cancer Biology. Dr. Mikovits has over 17 years experience studying hematopoietic cell growth, regulation and tumor biology and has spent more than 8 years studying the role of aberrant methylation in retroviral pathogenesis at the National Cancer Institute (NCI) - Frederick Cancer Research and Development Center, Frederick MD. Before joining EpiGenX she held the position of Senior Scientist & Head, Laboratory of Antiviral Drug Mechanisms at the Screening Technologies, Branch of the NCI with the focus of using high throughput screening technologies (HTS) for the development of antiviral agents directed against molecular targets of HIV-1 and other viruses involved in the pathogenesis of AIDS associated malignancies."

Her profile at EpiGenX (retried from archive.org) is below:

New UNR center raises hopes for CFS patients

2009-02-05-reno-gazette-journal-pg-2-a-clip-new-urn-center

Medical research facility is first built on campus in more than 20 years

BY LENITA POWERS
lpowers@rgj.com

People from across the nation and around the world who suffer from Chronic Fatigue Syndrome and other neuroimmune diseases are waiting anxiously for the opening next year of a new medical research center at the University of Nevada, Reno.

The $86 million Center for Molecular Medicine will expand the university's research capabilities into cancer and other diseases and house the headquarters of the Whittemore Peterson Institute, which offers hope in the form of clinical trials and treatment for people who suffer from such diseases as Chronic Fatigue Syndrome, fibromyalgia and atypical multiple sclerosis.

"I get letters from all over the world, Australia, Spain, Ireland, London," said Annette Whittemore, founder and vice president of the Whittemore Peterson Institute. "I got an e-mail saying Canada cheered when they heard the news that the institute was going to be a reality."

The institute plans to conduct clinical trials, but there is no waiting list yet, said Whittemore, wife of Nevada lobbyist, lawyer and developer Harvey Whittemore.

The Whittemores — whose 31-year-old daughter, Andrea, has suffered from CFS since she was 12 — donated $5 million to help build the Center for Molecular Medicine.

"We will actually be able to provide patient care that, right now, is very spotty

LENITA POWERS/RENO GAZETTE-JOURNAL

Kenneth Hunter is chairman of the Department of Microbiology and Immunology at the University of Nevada, Reno, and Judy Mikovits is the director of research with the Whittemore Peterson Institute for Neuro-immune Disease.

sense that it also is the first building ever built on this campus dedicated only to research, and that will allow us to generate more research dollars," he said.

The new center, along with other buildings that have recently opened or are under construction on campus, shouldn't draw the taxpayers' ire because they were in the pipeline and partly funded by the state before the economic crisis began, Glick said.

"The student union, the Knowledge Center, the Davidson Math and Science Center, every one of these buildings was approved three to six years ago by the Legislature at a time when the state was still booming," he said. "And the student

TAKE THE VISUAL TOUR

Log onto RGJ.com for a link to the University of Nevada School of Medicine Web site to take a tour of the architect's rendering of the building.

FAST FACTS

- $86 million, 100,000-square-foot Center for Molecular Medicine
- $19 million state funded, remainder from private donation and bonds paid by research grants, contracts
- Scheduled to open 2010
- Headquarters for Whittemore Peterson Institute for Neuro-immune Disease
- Will house portions of UNR's microbiology, pharmacology and physiology departments
- Will double the medical school's research and laboratory space

CFS PATIENTS MEET

Those who suffer from Chronic Fatigue Syndrome can sign up for a daylong patients' meeting March 12 to discuss new treatments and other issues as part of the International Association for CFS and Myalgic Encephalomyelitis Conference March 12-15 at the Peppermill in Reno. The cost is $75. To sign up, visit the association's Web site at www.iacfsme.org

in the clinics next to guys like Dr. Dan Peterson, who is one of the world's authorities on Chronic Fatigue Syndrome. This will give him an opportunity to run a first-class facility and train our students as well."

Judy Mikovits, director of research at the Whittemore Peterson Institute, is doing work based on blood samples taken

or nonexistent while also bringing expertise into the field," Annette Whittemore said.

Except for a one-time allocation of $19 million in state funds, the center will be financed with bonds funded by federal grants and contracts attracted by the center's expanded research capabilities and some of the nation's top researchers, said Kenneth Hunter, chairman of UNR's Department of Microbiology and Immunology.

"With this state-of-the-art facility and equipment, the ability we will have to recruit some of the best and brightest faculty and researchers with this extraordinary new building cannot be described," he said.

Hunter said the Center for Molecular Medicine received $1.6 million in federal grant money last year for equipment, much of which already is being used in laboratories on campus and that will be moved into the new building when it opens.

First research project in decades

The center is the first new medical research facility built at UNR in more than 20 years, and it will bring the university's research capabilities into the 21st century, President Milton Glick said.

"It's enormously important in the union was paid for by the students, who taxed themselves with an extra fee to pay for it."

The Center for Molecular Medicine will be funded in what is an unusual public-private partnership for the campus, Glick said.

"This is the first new building being constructed on campus where we will have the private sector occupying space they paid for," he said.

The Davidson Academy for exceptionally gifted students is a public academy started and partly funded by a private foundation, but it is located in the old Jot Travis Student Union, not part of a new construction project, Glick said.

Clinical trials draw funding

Hunter said the Whittemore Peterson Institute, which will be headquartered in the new center, will help the university's medical students, as well as patients.

"Think about having an institute that is one-of-a-kind in the world that is dealing with a highly prevalent condition, but there is really no specific place you can go to get this kind of treatment," Hunter said.

"Our students will be exposed to cutting-edge diagnosis and treatment for neuroimmune diseases," he said. "I envision our medical students standing by Peterson during a 1984 outbreak at Incline Village among about 100 people who exhibited symptoms of Chronic Fatigue Syndrome.

Hunter said the problem is that doctors have no test they can run to determine if someone has CFS, but research being done by Mikovits and other scientists that could one day lead to a blood test or other means of diagnosing the disease.

Mikovits, Peterson and other researchers with the institute will be making their presentations at the International Association for Chronic Fatigue Syndrome and Myalgic Encephalomyelitis conference scheduled on March 12-15 in Reno.

Hunter said only recently has enough scientific evidence has emerged to convince physicians and researchers that CFS is a disease and not just a catch phrase for a bunch of symptoms.

"You can imagine how frustrating that is for patients who clearly are suffering," Hunter said. "They go to a physician who, because this disease hasn't received acceptance in the medical community that others have, treats them for years for ancillary things other than CFS.

"So if this disease can be validated with research and strong clinical information, it's going to absolutely affect the lives of so many people in a positive way," he said.

2009 (Nov 11) - NY TImes - A Big Splash From an Upstart Medical Center

See [HN00S0][GDrive]

PUZZLING ILLNESS Andrea Whittemore-Goad's chronic fatigue syndrome prompted her parents to take action.Credit...Candice Towell for The New York Times

To many people who suffer from the poorly understood illness called chronic fatigue syndrome, a recent study linking the disorder to a virus was a victory for the little guys.

For one thing, the study pointed to a physical cause for an illness that the medical establishment had often snidely dismissed as psychosomatic. The research could not be ignored: it was published last month in Science, one of the world's pickiest and most prestigious journals. The discovery came, in a sense, from within the patients' own ranks: several of the scientists, including the lead author of the report, worked for the Whittemore Peterson Institute for Neuro-Immune Disease, a nonprofit in Reno, Nev., founded recently by the parents of a young woman who has the syndrome. And even though the institute was new, it had attracted collaborators from two high-powered centers, the National Cancer Institute and the Cleveland Clinic.

Harvey and Annette Whittemore were not the first to start a research foundation out of desperation to find answers for an incurable disease. The actor Michael J. Fox did the same for his own illness, Parkinson's disease. Others have created groups for pancreatic cancer, amyotrophic lateral sclerosis (Lou Gehrig's disease) and breast cancer. The foundations have in common a desire to pick up the pace of research, often by financing innovative ideas and avoiding red tape and bureaucracy. But few if any of the private groups have produced notable results as quickly as the Whittemore Peterson Institute has.

At least one million Americans have chronic fatigue syndrome, which causes severe fatigue, muscle and joint pain, sleep problems, difficulty concentrating and other problems. Its cause is unknown, symptoms can last for years and there is no effective treatment. Women outnumber men as patients, and many people with the syndrome feel stigmatized and brushed off as neurotic by doctors. Andrea Whittemore-Goad, who is 31, has had a severe case of the syndrome for 20 years.

"Three major medical institutions tried to marginalize her, tell her she didn't want to get well," Annette Whittemore said in an interview.

But Mrs. Whittemore had seen her daughter turn abruptly from a happy, healthy child to a very sick one, and she has steadfastly believed that some sort of infection must have been the cause. Researchers have not pursued the infection theory seriously enough, in her opinion, and doctors have been scornful. One physician told her that if he could not understand her daughter's lab results, they couldn't be important.

Another said "he didn't look at my daughter's medical information because he didn't want the facts to get in the way of his theory," Mrs. Whittemore said in an e-mail message. "I could write a book on ridiculous things that doctors say to patients with C.F.S." She added: "One day I just had enough. I said, 'I've got to do something.' "

She and her husband had the means, the knowledge and the connections. They are real estate developers and part owners of a gas company and an energy drink, and they hold interests in other businesses. Mr. Whittemore is also a lawyer and a lobbyist. Starting in the fall of 2004, they put $5 million of their own money into setting up an institute at the University of Nevada's medical school. They also persuaded the governor and State Legislature to commit $10 million for a new building that would house the institute's researchers and a clinic, as well as scientists from the university and the Nevada Cancer Institute. The research began in 2006, and a clinic for patients is scheduled to open in about a year.

Rather than just doling out money to far-flung researchers, the Whittemores wanted to employ their own scientists who would be devoted full time to the cause. In the spring of 2006, they met Dr. Judy A. Mikovits, a virus expert who had spent 22 years working at the National Cancer Institute. She had left the institute in 2001 to get married and move to California, where she went to work for a drug development company that failed. She was tending bar at a yacht club when a patron said her constant talk about viruses reminded him of someone he knew in Nevada. That person was a friend of Annette Whittemore's. Dr. Mikovits soon found herself at a conference on chronic fatigue syndrome.

"The meeting was terrible," she said. "The science in C.F.S. is awful, not because the researchers are awful, but because they have no resources."

But one presentation made her practically leap out of her seat. The speaker was Dr. Daniel L. Peterson, who treats Ms. Whittemore-Goad (he is the Peterson for whom the institute is named). He has seen about 5,000 patients with the syndrome in the last 20 years, and he described some who had also developed a rare type of lymphoma.

"I said, 'That's a retrovirus,' " Dr. Mikovits recalled.

Dr. Mikovits began connecting the dots almost immediately. She knew that some patients with chronic fatigue syndrome, and some men with prostate cancer, had a certain enzyme deficiency. And she also knew that tissue samples from men with prostate cancer had been found to harbor a retrovirus called XMRV, for xenotropic murine leukemia virus-related virus. She began working part time with the institute, and by the fall of 2006, the Whittemores had hired her as research director. One of her first projects was to look for XMRV in blood samples from people with chronic fatigue syndrome and from healthy control subjects.

Many of the samples from syndrome patients 🗣 68 of 101, or 67 percent 🗣 were infected, she and her colleagues reported in Science. Only 3.7 percent of the healthy controls carried the virus. XMRV, the scientists suggested, may cause or at least contribute to chronic fatigue syndrome. Further tests found the virus in 90 of the 101, Dr. Mikovits said.

Retroviruses can cause cancers in animals, and in humans, they include HIV and a virus that can cause leukemia. "I knew how serious a retrovirus is," Mrs. Whittemore said. "I was very concerned, knowing there would be serious implications. My second thought was, of course it was going to be something serious like that. Look at my daughter and how ill she is. Why would we expect it to be something simple? I also felt like the weight of world was on my shoulders. We would have to be telling people some very bad news."

But many patients were grateful, and said they found hope in the discovery 🗣 hope that now their illness would be taken seriously, and hope that the new information would lead to effective treatments or even a cure.

But the study is not conclusive. Other scientists need to replicate the tests to find out if the initial findings hold up, and a great deal more work is needed to

determine whether XMRV really does play a role. Just detecting it in patients does not prove it made them sick; patients may have some other underlying problem that makes them susceptible to XMRV, which could be just a passenger in their cells.

Dr. Peterson said he thought the crux of the problem in chronic fatigue syndrome involved a derangement in the immune system that could allow old viral infections 🗣 with various herpes viruses, for instance 🗣 that were once under control to become active again.

"XMRV is the sort of agent that could create that effect on the immune system," Dr. Peterson said. But he emphasized that more research was needed.

AMONG those expected to try to replicate the XMRV findings is the Centers for Disease Control and Prevention. But Dr. William C. Reeves, who directs the agency's research on the syndrome, has said that he does not expect to find the virus in blood samples from patients. He said that no other studies had ever proved a virus to be the cause, and that stress and a history of sexual and emotional abuse were more likely to play a role in many cases. "I blame the C.D.C. for most of this mess," Mrs. Whittemore said, adding that thinking like Dr. Reeves's was what drove her to start her own research center.

The Whittemore Peterson Institute is running on about $1 million a year, to pay for salaries, equipment, supplies and other expenses. In the world of research, that is not much. The Whittemores are trying to raise more money, and have received donations as large as $50,000 from friend down to a few dollars from patients who are sick, out of work and broke, but eager to support any research that may one day help them.

Mrs. Whittemore feels that she is racing against time to save her daughter. For a while, Ms. Whittemore-Goad had improved on an antiviral drug, but she had to stop taking it because she had a reaction to it. She had worked part time as a yoga instructor, and she married in the last year, but now rarely goes out because she has seizures.

"She is just really very, very sick," Mrs. Whittemore said. "She's had this for a long time. We've got to get something for her as soon as possible. That is the driver for the speed on this. I don't want to lose her. I can't lose my daughter. I don't want to win this battle and lose the war." '

2009 (Nov)

http://cfspatientadvocate.blogspot.com/2009/11/

The Patient Advocate has known about the ImmuKnow test from Viracor for several years. Here are some quotes from the ViraCor site:

"ImmuKnow is a noninvasive biomarker of immune function that assesses cellular immune status by detecting cell-mediated immunity (CMI) in adult immunosuppressed patients. It measures the concentration of adenosine triphosphate (ATP) released from CD4 cells following cell stimulation."

"ImmuKnow is the first and only FDA-cleared blood test to measure the vitality of a patient's immune system."

This means that the test is regulated and that it does as advertised. The ImmuKnow test takes a small sample of blood and exposes it to a proprietary reagent (made by Cylex) that stimulates the CD4 cells. ATP activity is measured in these CD4 cells. ViraCor has created a scale (<225 – weak immune response, 225-525 – moderate immune response and >525 – strong immune response) and this test is a measurement of immune function. The ImmuKnow test is used for tracking immune function in AIDS management and in transplant patients who take immunosuppressant drugs. It is being tested in diabetic patients undergoing Islet Cell transplant. At a CFS conference, Dr. Dharam Ablashi (see picture above) suggested using it for CFS. The PA is unaware of anyone with CFS actively doing it - except for his daughter. A number of CFS patients were given this test and their average number was 281. Further information on the ImmuKnow test is available at the ViraCor website. The ImmuKnow test is a quick and easy blood test that can be done through various labs, including Focus Diagnostics.

Ablashi's study of 2005, using Dr. Daniel Peterson's patient population, tested the functionality of the global T-cell response using an FDA cleared response for cell-mediated immunity assessment (Cylex Immune Function Assay, ImmuKnow) - and these cellular responses were compared to patients with HIV and immunosuppressed transplant patients. The ImmuKnow test was assessed based on the amount of ATP expressed in ng/ml. All three groups has median immune function that was not statistically different. The transplant patients averaged 259 ng/ml ATP, followed by HIV patients at 263 and CFS patients at 281. CFS patients showed consistency with both the transplant and HIV patients - with the majority of patients in the median zone, followed by patients in the low zone, with the smallest percentage in the strong zone. More can be read in Ablashi's and Krueger's book Human Herpesvirus-6.

Dr. Dale Guyer uses this test in his practice and has a positive feeling about it, believing that the numbers rise as the immune system becomes stronger. This Patient Advocate is not aware of other CFS doctors using this test. It is an easy blood test and relatively cheap and fast - $180. Whether it is useful or not, is anyone's guess.

SUNDAY, NOVEMBER 1, 2009

Judy Mikovits and serendipity – how lucky we are.

The Patient Advocate took a picture of Judy Mikovits from the 2009 UK conference DVD and gave it to his daughter, saying, "This is the woman who is going to make you well". My daughter put Judy's picture on the wall of her room where she rests.

The Patient Advocate first saw Judy Mikovits at the CFS conference in Ft. Lauderdale, FL in January 2007. She was presenting a paper on "Incidence of Chromosomally Integrated HHV-6 (CIHHV-6) in a Cohort of CFS patients with Clonal TCR-g and Lymphoid Malignancies". The PA did not take any special note of this lecture except to note that Dr. Mikovits talked like a typewriter.

In April of 2008, the PA saw Dr. Mikovits give another presentation in London. The PA's report at the time said this: "The last major lecture was an incredibly high-powered presentation by the American researcher, Dr. Judy Mikovits. She is the research director of the new Whittemore-Peterson Institute of Neuro-Immune disease in Reno, NV. In a lecture of which I understood next to nothing, she gave every indication that this institute has the funding, the drive and the independence to reveal some important elements of this disease. She also indicated a no-nonsense willingness to cooperate with others world-wide in this struggle. I have seen many scientists make presentations, and this gal was amazing. With this presentation, along with the others, there was a clear picture that the Americans were back in the UK doing what they do best."

Another attendee of this conference wrote this: "Dr Judy Mikovits is Research Director of the Whittemore Peterson Institute in Nevada and she presented

a most enthralling presentation on the focus the Institute's research although most of the technical detail was way over my head. The research looks at abnormal inflammatory response to viruses and part of it piggybacks off Dr Kerr's work."

Of the Reno conference in 2009, the PA wrote this: Mikovits, the director of the Whittemore-Peterson gave a slam-bang talk, one similar to what she delivered in the UK last May. However, this time she had less time and she really had to whirl through it. This gal is generally accepted as being a serious researcher and in a position to get some results. She is obviously bringing money and people over from her former research field in cancer. Here is a quote from Judy Mikovits that surfaced on Cort Johnson's site after the Reno conference: "We have a piece of data that would just knock your socks off but I'm not showing it. "

The PA has developed the habit of sitting through days of scientific or quasi- scientific lectures. It is possible to nose out the more scientifically interesting talks, even for a non-scientist. After awhile one can sense the "cannon fodder" talks that dominate all of these conferences – those happy little academic talks that are going to go nowhere.

Consequently this Patient Advocate was ready to really listen to Judy Mikovits in May 2009 at the London CFS/ME conference. "Dr. Judy Mikovits, who astonished so many folks at this conference last year, was back for another lecture. She made her usual complex and far reaching talk, most of which passed over my head. (I should have studied biochemistry.) Her work at the Institute involves sub-setting CFS through gene array chips and cytokine testing. The Institute is moving very fast and I get a sense that specific information is going to emerge here sooner rather than later. Certainly talking to Annette Whittemore and hearing Mikovits and Peterson makes one sense something is afoot, although they are smart enough not to say anything. During the question period Dr. Mikovits was asked if they had been working on a specific virus involved in CFS. She coyly answered, almost in a whisper, "yes" - and then she followed up that there is a novel virus not previously associated with CFS and that the WPI had submitted their research paper for publication at Science magazine."

And then came October 9, 2009 and the world of CFS/ME turned.

The connection between Judy Mikovits and the Whittemore-Peterson Institute was a bit of serendipity. Dan Peterson was giving the last lecture of the day at a HHV6 conference in Spain in 2005. Judy Mikovits was in the audience and responded to Dr. Peterson's plea to the audience (during the question period) for help with a problem that he was having. Ten of his CFS patients had developed mantle cell lymphoma and he was stumped. The following comes from an interview with Mikovits on Cort Johnson's site: "These people were getting lymphoma and they were getting it before anyone gets lymphoma and to me that says virus." "My background is in virus caused cancers. My training for over 22 years at the NCI was in how viruses dysregulate the immune system and cause disease – cancer. So when he told me to come meet with him after the talk I beat my way up to the front of the room because it was the only interesting thing that I had heard at the meeting, and I said, "There is something there, that's a smoking gun", so I gave him my card, told him that I'm interested, told him what I thought was going on, and he and Annette invited me out to Reno. Within two weeks of that meeting, they talked about setting up a summer research program."

Judy Mikovits showed up in the right place at the right time. However, she is not solving this problem on her own. Many physicians and researchers have plowed the ground ahead of her. She is the beneficiary of many efforts.. It is a bit like volleyball. The ball is controlled, set up and then spiked. Judy is the spike.

From all accounts, Dr. Mikovits has great empathy with the CFS/ME patient population. All good artists have empathy for their subject. An artist, as well as a scientist, benefits from "attachment to the subject". This empathy, this connection. does not come easy, and is not taught in schools. Not everyone has it. It is inherent in the personality of the individual. Dr. Mikovits seems to "have it". A recent article in the Reno Gazette Journal had a personal bit about Dr. Mikovits: "My grandfather was dying of cancer, and nobody would talk about it," Mikovits said. "One day I said to him, 'Don't you know you're dying?' And he said, 'Don't say that. I don't want your grandmother or your dog, George, to know." "He was dying of cancer, and nobody would talk about it. That's what bothered me most."

Annette Whittemore has spoken of how much Dr. Judy Mikovits lab collaborators enjoy working with her. "Dr. Judy", as her students call her, is both disciplined and relaxed, with a good sense of humor. "Dr. Judy" works long hours, setting the tone and direction. Others follow suit.

A recent article in the Reno Gazette Journal has a number of good quotes from Mikovits.

About the moment of truth with XMRV: "It was January 22, and we were in a San Diego restaurant called the Yard House," said Mikovits, who had gone there with fellow scientist Vincent Lombardi to present the results of their research to Frank Ruscetti and Robert Silverman, two of the world's leading virologists. "We kept waiting for them to say something," Mikovits said. "I was nauseous. Bob (Silverman) waited a long a time, and then he looked up and said, 'Well, this is going to change their world.'" And it has.

About getting traction: "They want us to send them the (XMRV) retrovirus so they can screen huge libraries of compounds and see what they have that could work," Mikovits said. "They already have drugs to treat HIV, so they could redesign a compound for the XMRV virus. Since they already have FDA approval, they could get something out to people fast."

"I've gotten more than 100 e-mails from physicians, and I've gotten calls from the head of the Mayo Clinic and the clinical director at Sloan-Kettering," she said. "Those people wouldn't take the time if they didn't think this was a significant finding."

"We've got about 500 samples from the United Kingdom, and we also were approached by the head of the syndrome organization in Spain," she said. "We eventually expect to collaborate with many other countries: Norway, Germany and others. Everybody is asking if we can test their samples and asking how they can get in the clinical trials."

About the Barcelona presentation in October 2009: "They applauded before I gave my presentation," she said. "It was such a surprise, because they never applaud before a presentation."

2010 (est) - Resume for Dr Judy Mikovits PhD, "Research Director Whittemore-Peterson Institute, Nevada, USA"

Source - http://resime.org/JudyMikovits.htm

Dr. Mikovits obtained her Ph.D. in Biochemistry and Molecular Biology from George Washington University.

Dr. Mikovits spent more than 20 years at the National Cancer Institute in Frederick MD where she investigated mechanisms by which retroviruses dysregulate the delicate balance of cytokines in the immune response.

This work led to the discovery of the role aberrant DNA methylation plays in the pathogenesis of HIV. Later in her career at the NCI, Dr. Mikovits directed the **Lab of Antiviral Drug Mechanisms (LADM)** a section of the NCI's Screening Technologies Branch in the Developmental Therapeutics Program. The LADM's mission was to identify, characterize and validate molecular targets and to develop high-throughput cell-based, genomic and epigenomic screens for the development of novel therapeutic agents for AIDS and AIDS-associated malignancies (Kaposi's sarcoma).

Dr. Mikovits served as a senior scientist at Biosource International, where she led the development of proteomic assays for the Luminex platform that is used extensively for cytokine activity assessment in therapy development.

She also served as Chief Scientific Officer and VP Drug Discovery at Epigenx Biosciences, where she lead the development and commercialization of DNA methylation inhibitors for cancer therapy and of cell and array-based methylation assays for drug discovery and diagnostic development.

She is Research Director at the Whittemore Peterson Nevada CFS centre for Neuro-Immune disorders and has co-authored over 40 peer reviewed publications that address fundamental issues of viral pathogenesis, hematopoiesis and cytokine biology.

Formally trained as a cell biologist, molecular biologist and virologist, Dr. Mikovits has studied the immune response to retroviruses and herpes viruses including **HIV, SIV, HTLVI, HERV, HHV6 and HHV8 with a special emphasis on virus host cell interactions in cells of the hematopoietic system including hematopoietic stem cells (HSC).**

Dr Mikovits was co-author of the "Detection of an Infectious Retrovirus, XMRV, in Blood Cells of Patients with Chronic Fatigue Syndrome" research paper in October 2009 in Science magazine - click here

(with grateful thanks to the Whittemore-Peterson Institute for this information)

2010 (Feb 24) Interview - Mikovits XMRV Seminar – Transcript With Slides

Source : Part 1 is [HX000T][GDrive] , Source Part 2 is [HX000U][GDrive]

Long-time ProHealth subscriber and contributor Sandy Miarecki has compiled and edited in one transcript the XMRV Seminar that Whittemore Peterson Institute Research Director Dr. Judy Mikovits presented Jan 22 in Santa Barbara – helpfully indicating where each slide fits in the text. To download the slides (about 19 MB): click here.

_____

Annette Whittemore: I am happy that the ProHealth organization was able to get this online so a lot of patients who are too ill to make it are able to follow online. I'd like to thank Rich Carson, I'd like to thank ProHealth for putting this together, and the HHV-6 Foundation and Kristin Loomis. It's a pleasure to be here and to have an opportunity to speak to you about the recent discovery of XMRV in Chronic Fatigue Syndrome patients. Thank you for inviting Judy Mikovits today. We've made a special effort to learn more about the most exciting news in the world of CFS since the 1980s when major outbreaks of this disease were reported in several locations around the US, including three small towns in Nevada.

These reports came on the heels of the discovery of HIV and AIDS. During this time, Dr Mikovits was at the NCI working in laboratories that were actively studying this new virus, when she began her doctoral program at George Washington University. In fact, she wrote and presented her doctoral thesis on HIV latency, presenting it the same day that Magic Johnson announced he was HIV positive. The good news is that he is still healthy after all these years, having had the opportunity perhaps to prevent a high viral load from ever occurring.

Jumping forward to 1989 brings a critical event to the life of our family. Our daughter became ill, and suddenly we found ourselves in a black hole of medicine where no one seemed to agree on anything having to do with a disease that had been dubbed 'Chronic EBV.' The problem was that she didn't have EBV or even the antibodies that would have indicated that she'd been exposed to that virus. Like you, we sought answers, but instead we found confusing and even nonsensical theories about her illness. And thus began the journey for answers.

All of us have various milestones in that journey. Our first and probably one of our most exciting milestones was meeting Doctor Peterson, who at that time was promising that he would do all he could to help Andrea and to help this family. Our second milestone was really meeting Dr Mikovits. And that was a wonderful and perhaps prophetic meeting. We were at an international conference, and she had come along as a guest of the HHV-6 Foundation, when she heard a very important talk about a set of patients who were developing a rare form of cancer. She took a leap of faith with us to develop a medical research institute when we asked her to come to Reno, and the rest is history.

Judy brought with her a scientific passion for discovery of truth, and a curiosity, with well-taught skills from the laboratory of Dr Francis Rosetti, the co-discoverer of the first retrovirus HTLV-1. Judy has a fiery temperament and a heart of gold. And when she is not counseling CFS and cancer patients, she teaches students, devises experiments, and travels to major conferences and universities to educate others about the intricacies of the scientific methods used to find infectious and replicating XMRV in the blood of CFS patients.

Before I introduce you to Judy, I'd like to ask three things of you. First, please stay involved and advocate for your rights, medical treatment, and adequate funding of research. Your congressmen and senators need to hear from you. Second, please stay informed and educated. Listen critically to what is said and who is delivering the message. Are they speaking on your behalf? And third, I want you to know that the WPI is going to continue its promised mission. We are not going to stop until we find the answers, but we can't do it alone, and so we do continue to ask for your support and your help. We appreciate so much all the donations that have come in, all the amazing good wishes that have come our way, and we wanted to thank you today all around the world for letters that have come in to support this effort; that really really helps.

So now it is my good pleasure to introduce you to Dr. Judy Mikovits, research director of the WPI.

Dr Judy Mikovits: Well, thank you Annette. I too would like to thank ProHealth and particularly Kristen Loomis and the HHV-6 Foundation for sponsoring this event. What Annette didn't say is that it was Kristen Loomis who put us together by asking me to attend that meeting in Barcelona, Spain. I never did get outside to see Barcelona, but I saw some amazing scientists and physicians there in the room and in the meetings. So I'm also honored that you came out on this day, and I understand how difficult it is for patients to get here, and I appreciate all the calls and letters we have gotten around the world since the publication of this paper. It's amazing the response that we've gotten, and we're just delighted. We work for you.

[SLIDE 1: Whittemore Peterson]

The institute is a translational research institute. You can tell the architects drew this because they're making a lot of money. We don't usually drive Porsche cars [laughter]. But at any rate, this is what the building looks like. It is three-quarters built, and will be open to serve patients in September this year. So, keep your eye out for the opening ceremonies and the ground-breaking there. We're excited to see patients.

Before we could see patients, Annette knew that she would need to start a research program because there were no bio-markers, diagnostics, treatments, or anything. We started looking with the patients there, with the diagnostic acumen of Dan Peterson. So, I came up right after that meeting in Spain in 2006 and spent the summer just meeting the patients. I'd never heard of the disease before then, and it was just eye-opening to me to see how sick these patients really were and to try and understand really what the disease was. My dear husband, when I talked to him about Reno, all he kept saying was "Reno? That's not by the ocean" [laughter], but I'm a patient advocate as well in Ventura County with a Cancer Support group with Bible Fellowship Christian Cancer Support Group, and they were kind enough to let me go to Reno because I said "These people are much sicker than you." [laughs]

[SLIDE 2: XMRV, a New Pathogenic Retrovirus]

I'm going to talk to you exclusively about the retrovirus XMRV. I understand that I've left a lot of the detail of the science because, when we see the science, you start to understand the implications of this discovery, in not only this disease but perhaps a number of old diseases where we might find a new understanding. So, this is the Cleveland Clinic rendition of the retrovirus, and of course the electron micrograph that accompanied the publication in Science. I'm going to give you a little history lesson. We're going to walk through the publications.

[SLIDE 3: Identification of a Novel Gammaretrovirus]

Interestingly, XMRV was identified by Bob Silverman and Joe de Risi in 2006, so just at the time that we were meeting each other and making these fateful introductions, this virus came out, where Bob Silverman, who was an immunologist at the Cleveland Clinic, was looking at prostate cancer patients where there was familial prostate cancer. That is, it's hereditary, but that it's hereditary in a funny way where maybe brothers-in-law or distant relatives would get it and not direct father-son, things like that. We had a case in my own family where my stepfather died very young of prostate cancer. It's an aggressive cancer, and when you get prostate cancer very young, it suggests there's something else going on environmentally.

So he looked at a single nucleotide change of a variant in an anti-viral gene known as RNase-L. This gene, the protein's job is just to degrade RNA from viruses and protect you, and turn on the interferon response. But he found a variant in that gene where that single base change, that is in about 13% of the population, makes this enzyme only about 20% as active, so it dysfunctional because it doesn't work. So he hypothesized that maybe these men were susceptible to a virus. And he met Joe De Risi at UCSF, who had a technology which is basically a chip. It's like a chip with a bunch of information on it. The information is just sequences of every known mammalian virus, so 20-30 maybe 70 base pairs of every known virus from a considerable spectrum.

He simply took the DNA from these men and applied it to the chip, and the red part you see right here shows that it exactly matched [if you want to match in opposite] the sequences from this particular virus. So when they took this out, and they sequenced the virus there, they found that there were retroviral sequences in 10% of those tumors, and those with that particular variance, and that those sequences were most closely related to what was xenotropic murine leukemia virus. It's a gamma retrovirus, and we'll talk more about that later. They just number them alpha, beta, gamma for convenience because the numbers are known.

[SLIDE 4: Xenotropic Murine Leukemia Retrovirus-related Virus]

Xenotropic means it can no longer infect mice. Xeno means foreign. So what we know from the xeno family of viruses is that they look like murine leukemia viruses, but they lack a receptor, and we'll talk about that later, so that they can't infect mice. So he named this virus Xenotropic Murine Leukemia-Related Virus because it wasn't exactly the mouse virus. Clearly it was something different, suggesting that this might be a new virus. So, his laboratory did a little more work in the next 2 years. Again we're just talking about 2007-2008. Usually it takes a year just to get a paper published.

What he at first identified, they knew that the mouse family of xeno viruses would recognize and bind and actually enter the cell through this receptor. So it sees the receptor; it's called XPR-1, and this is a calcium channel type, an ionic receptor. They don't know the function of it. This is called the G protein; it has a particular role in sequencing. We know there's a loop right here or so, where the mouse virus has two or three amino acid changes, and that's why the virus can no longer infect mice. That's one of the reasons we know this is not from a mouse. This receptor is on every cell in the body. So it doesn't tell you a whole lot about the infection or what cells would get infected in the disease.

The next thing he did was he molecularly cloned this. He used techniques to write the virus, the entire 8,000 base pairs, and put it in a vector which allowed him to multiply it and make it an infectious virus. So, he made this infectious virus, but he didn't actually isolate it. Using the infectious clone, he then infected various cells and found that the virus integrated. It inserted itself into DNA preferentially at the start site of genes. And that's the part of the gene that turns on and off their expressions, so a lot of the differences you see in patients could be explained by turning on and off the wrong genes when a retrovirus integrates.

[SLIDE 5: Genomic Structure of Gamma Retrovirus]

Let's do a little bit of retrovirology 101. This is the genomic structure of a retrovirus. Now, retroviruses have an RNA genome. We have DNA genome. We

have nucleic acids; our genetic information is packaged in DNA. This virus has a single stranded RNA genome that's present in two copies in the virus. So, it first has to be reverse transcribed by the enzyme reverse transcriptase. So, you have to take the RNA back to DNA and then the integrase gene there, shown here; this is a pol, so all a simple retrovirus will encode is the structural proteins, gag, pol, and the envelope, and then the enzymes. They don't have any extra proteins like HIV or HTLV-1 which are complex retroviruses, and they write a bunch of proteins that regulate different parts of your body.

The good thing about this virus is that it's a simple retrovirus. There's less that it can do to interact with your cells to have those go wrong. That's the first piece of good news. It's the first ever simple retrovirus known to infect humans. We can think a lot about that as scientists and how it might cause disease.

[SLIDE 6: Schematic of Retrovirus Particle]

Once you make the virus, you go from your genetic information I showed you in the last slide into the envelope protein which has two proteins actually in the surface unit. This is what binds to that receptor, and then the trans-membrane unit that sets itself into the matrix of the capsid. This is the capsid protein there, and that's known as gag, so you're gonna see capsid and envelope throughout this talk, so you'll understand that when you have antibodies that develop. These antibodies are recognizing these areas of proteins, and this is depicted here as that double stranded RNA nucleus, and the polymerase which simply writes the RNA into DNA and then packages it all up and leaves the cell.

[SLIDE 7: Detection of Retroviruses]

Now let's talk about how you detect retroviruses, because that's important in thinking about how we found this virus and how we study it in the laboratory. The viral life-cycle is as I just described. Once you have the DNA integrated into the chromosome, once it's integrated to the reverse transcriptase integrated it into the chromosome it's there and it replicates every time your cell divides and your DNA replicates. So if your cell isn't dividing, theoretically it's just latent. It's just there in the DNA, and it's not making more viruses, it's not making copies of itself. It's not infecting more cells. This is a good state, if you have a retrovirus, is to just shut down the transcription.

As Annette said, when Magic Johnson was found to sero-convert, they found an antibody in his blood, so that's very shortly after he became infected. So they were able to give him therapeutics to prevent the virus from making many more copies in his body. Theoretically the reason why he never got sick is because he is maintained on those anti-retroviral therapies as well as the immunomodulating therapies. He's kept that virus down so that he never theoretically will get AIDS. We'll talk more about that later.

Once the cell starts dividing and you start writing that DNA and transcribing it into all of the proteins we just discussed, the envelope will then package the core of the capsid there, that looks like this, in the RNA genome, that double stranded genome, and it actually uses your cell membrane, cholesterol, and lipids to leave the cell then and look like that artist's rendition of the viral particle. So, when you're looking for retroviruses, and there are only two known, the HTLV-1 family – there's a one and a two – and HIV, the human immunodeficiency virus.

As Annette mentioned, Frank Ruscetti discovered this virus and reported it in 1980. At that time, there was no PCR, so he couldn't look for an infected cell by a sensitive method. He looked for that enzyme reverse transcriptase because reverse transcriptase is only in retroviruses and not in human cells, so it's easy to look for the activity of that protein that would then transcribe and make the virus. And sometime maybe if you've learned the history; it's amazing the small small signals they found in the early days to describe the virus.

But then you're going to do what we call a Western Blot, which is to run out the proteins of a cell on a gel electrophoresis and just blot it and look for antibodies – and we'll show you those later – for the viral proteins and test for specific antibodies to the envelope and the gag proteins and just look for the presence of virus in infected cells. The first thing you do clinically is you look for serology – that test that shows you that your system is making an antibody to that virus. That was the test that Magic Johnson got. You have a virus in your body and your immune system's job, to distinguish self from foreign. So we know this is foreign because you have made an antibody to it and then finally, it's rarely done clinically, to identify HIV or HTLV-1, is to isolate the virus and actually purify it in cell culture.

[SLIDE 8: Detection of an Infectious Retrovirus…]

So that leads us up to the next paper. After the first bit of work that Bob did in describing this virus, there wasn't a lot of excitement about it in the scientific community, because they didn't know that it was an infectious virus. It was just sequences in prostate tissue tumors, and it wasn't meaningful to the scientific community because we all have sequences of viruses in our body as we all know, maybe as much as 15% of our genome is made up of viruses that are silenced by our immune system so that they can't be expressed.

The work that we did then generated a lot of excitement. What we did was we detected this infectious retrovirus and showed that it was infectious in the blood cells of patients with Chronic Fatigue Syndrome. We're going to walk through exactly how we did this to show the virus. At first we did PCR because at the time this paper was done, the only thing that was known was Bob Silverman's specific PCR technique. We had not validated or identified any antibodies. It was not known that it was a pol-virus, an infectious virus. So that's what this work was, it was serendipitous really, that we happened to have the patients who had this virus because, if we did not have a well-identified cohort of CFS patients, and we were just looking at the general population, retroviruses aren't highly expressed in the general population. HTLV-1 is 0.2% in the US population, and we'll talk a little bit more about what that means too. Retroviruses are not ubiquitous. It's not like EBV and CMV, where everybody has them.

We had these well-characterized patients who had been sick for many years. I think it was a large part of why we're able to isolate this virus.

[SLIDE 9: CFS Study Cohort Reported in Science]

We'll start at the beginning, and that's the cohort, who they are. When it came to the Institute, what we talked about, was really important, was having a repository of samples from all of the patients so we could look at the RNA for their gene expression, at the DNA for maybe what was different about the genetics of some of you that might make you sick. Then we look at the plasma for proteins to see if we could identify immune modulators called cytokines that tell your immune system and tell your brain how to function. So we made these samples across RNA, DNA, protein and plasma, and then a culturable cell, so we kept some frozen such that we could grow them up and make more of them, any time we wanted, of your peripheral blood mononuclear cells; that's your white blood cells.

We used patients who came literally from around the world, and this was actually not correct in the Science paper because I didn't know there were international people in the repository at the time. When they come to Incline Village, it's assumed that they are from Nevada, and when we decoded this over the Christmas holidays we found 12 or 15 states, the UK, Ireland, Germany and Australia as well. So we had both international and people literally from all over this country, not necessarily Reno, Nevada, where the associated outbreak that we know occurred there in the early '80s.

The conclusion – all you had to do to be a sample in our repository was have a CDC diagnosis of Fukuda criteria or the Canadian definition diagnosis which is

The conclusion... all you had to do to be a sample in our repository was have a CDC diagnosis of Fukuda criteria or the Canadian definition diagnosis which is more stringent for various immune defects and inflammatory defects. Regardless of severity, the samples in the repository are from people aged 19-75. We don't have any whole bodies yet of people; though people do offer to donate whole bodies, however I don't think we need them at this point [laughs].

The study characteristic, like the disease, was 67% women, reflecting the gender bias in incidence of CFS. The mean age was 55, but some of these people had been sick since they were children or early 20s or early 30s, so they had a long haul with this illness. The 218 control samples were de-identified samples, so we don't know who these people are. They came from two places; they came from a medical practice in Reno, they came from a doctor who identified these people as healthy, and these were collected from people before I came to the University in 2007, and they were looking at the immune systems of healthy people to identify some of the functions, so we were able to use those samples under IRB approval. There is also a paternity diagnostic company in Reno, where they get samples from all over the world from mom and dad, so we tested from those 100 or so samples too, so we were at least able to zip code match. We have regional areas for the geographic location, so it was matched for location.

This is a PCR gel; I simply run them out for electrophoresis, and that gives you a different size so you can look at the exact size of the fragment of DNA that you're looking at. Again, this was done by Bob Silverman who is our collaborator in the study. Today is actually the first anniversary of January 22nd when I called … we saw some of these data right after the Christmas holidays, and we had promised Bob for a long time that we would look at this because RNA cell is a major defect in our patients, whether it's underactive or overactive. Something is wrong with the RNase-L pathway in CFS patients, according to decades of research.

We promised Bob that we would simply look, although we had done micro-ray technology, and we had not found the virus there. We had his specific primer pairs so we could go in and look for that gag structural and that envelope gene, so that we could see viral sequences in the cells that could make viral proteins theoretically. What we found was that 67% of the patients we looked at, we could find sequences in both the gag and the envelope gene or just the gag depending on the virus life cycle at the time. This was astounding because we only found the sequence in 3-4% of the healthy control population. It's also interesting; I said 68 out of 101 patients.

[SLIDE 10: Presence of XMRV Sequences in Human DNA]

On some of these patients, we looked three and four times for the DNA in the unstimulated cells. So this is just that pellet that I made when I sorted all the various samples. I just held one as white cells so that I could make DNA later or RNA later, depending on the technique I wanted to use downstream. So, it's important that this was in 68 out of 101 samples. It was 68 out of 101 patients, and it clearly says that in the paper. At any given time, depending on the viral life-cycle, we might not find this virus in the unstimulated group (inaudible). And I give you the example of that is: follow this patient 1118 throughout the talk, and you'll see that this patient, if you only use sequences, would have been called 'negative.' So, we were concerned because PCR is a technique that is fraught with contamination. If you're looking for a needle in a haystack, just a few sequences in a million bases, you might make an error in your enzyme, and it might put the wrong base in there.

[SLIDE 11: Comparison of Nucleotide Sequences from XMRV…]

Jaydip Das Gupta in Bob Silverman's lab cloned and sequenced three of these patients – and that's shown here – and what it's intended to show is: If you compare the isolates that they had from the 3 prostate cancer cases, where they had actually cloned these, you can see, if you compare it to the reference strain, known as VP62, that's the reference strain of what this virus looks like, the CFS samples here were clearly different, but they were highly similar – 99.7% – there were maybe 8 bases different across the entire 8,000 base pairs. This virus isn't like HIV theoretically. It's not changing. We don't find quasi-species in patients when there are lots of different viruses, because HIV mutates so much. Therapeutically, that's something that we can take advantage of and suggests that it might be easier to develop therapies because the virus is going to be largely the same.

[SLIDE 12: XMRV Isolates from Prostate Cancer and CFS…]

Rachel Bagni, my former student at the National Cancer Institute – I asked her if she could construct what is called a phylogenetic tree of this virus so we could understand where it came from (hopefully). And so that's shown on the next slide. And what a phylogenetic tree is – is you take all of the sequences of all the Murine Leukemia viruses – they're called Ecotropic viruses – all the families of virus that they've ever identified, Mason-Pfizer Monkey virus, all the sequences, and you put them into the computer, and then you put into the computer at the same time the sequences of our 6 isolates – the 3 prostate cancer and the 3 CFS isolates that we had at that time. And you do what's called 'blasting'. You ask the computer to find similarities. And when it doesn't find similarities, you get what's called a new branch on the tree. So, clearly, these diverge here, and we don't know when that is in time, but these data suggest that the prostate cancer – that XMRV both in prostate cancer and in CFS – form a new distinct branch, that it's a new human retrovirus. It doesn't have any of the sequences of mouse in it. And when we blasted it, also we did the same thing against the human genome – because I told you, we have a lot of endogenous viruses that don't actually come out of our bodies as infectious particles – we blasted it against the human genome and found that it did not match any sequence in the human genome. So, it's clearly a foreign, exogenous virus that can now, theoretically, be infectious. And that's what we'll show in the next slide.

Email Address

Here are our sequences. And you can see, they are clearly not contaminants. We didn't have this – we weren't working with this in the lab, actually, at the time. But we didn't have this, and maybe spread it through the sample in any way. It was there – clearly different isolates. We now have more than 170 isolates, because we isolate from every single patient in all of our studies. And we're actively looking for funds and going to sequence those viruses because it might give us clues as to some of the differences in what we see, maybe something, you know the various symptoms, because CFS is quite a heterogeneous disease.

[SLIDE 13: XMRV: A New Human Retrovirus]

At any rate, we next went to – I'll summarize that – in summary, what is XMRV then? These data suggest, at this point in time, we have sequences related to XMRV that were not found in any mouse strain. So, it's a new human retrovirus. The origin of XMRV remains unknown. We don't know how it got into the human species. We don't know how long it's been – 40 years is the guess of John Coffin, who is a mouse retrovirologist working on these families of viruses for more than 40 or so years. And that XMRV is not a mouse virus – clearly from these data. So it's a new human retrovirus.

[SLIDE 14: Detection of XMRV Protein Expressed in Activated…]

We next asked: Could we find those proteins I mentioned? We took advantage of (inaudible). Sandy Ruscetti, Frank Ruscetti's wife, had been in

retrovirology as long as he had, but because they didn't want to work on the same thing, men usually get the credit for what women do. So Sandy worked on mouse viruses, and Frank worked on human viruses, and I don't think they actually ever published together. But we were thinking about it and saying: None of the reagents that were out in the world, so far nobody had found viral proteins from XMRV, even though it had been discovered two or so years earlier. In January we started looking.

Sandy had saved a box of antibodies – this is really a tribute to the value of your tax dollars going to basic research – because they created this mouse retrovirology program and put a lot of money into trying to understand – if you can understand how viruses cause cancer in mice, you might understand how it causes cancer in humans. And this was in the late '70s and early '80s. And somewhere in the early 2000s, they were going to throw out all of these reagents that they developed and Sandy said, "No, I'll keep them in my freezer." Frank always says that the reason they're still married is because Sandy never throws out anything.

At any rate, she gave us these viruses, I mean these antibodies, and we screened our samples there for protein in our samples. So, we looked at the activated peripheral blood mononuclear cells. And what we do is we stimulate these to divide, and add T-cell growth factor, or now known as IL2, which was actually the discovery that Frank made that preceded the identification of the first human retroviruses. Retroviruses grow and divide in cells, so you have to divide the cells in order to get the virus to replicate to levels that you can see with the technology of the time. And that's important in this study too.

What we've got here is we looked at a number of her antibodies – these are all family members of the virus – this particular antibody which you'll hear a lot about is a spleen focus forming virus. It's a mouse virus that causes various diseases including a neurological disease and erythroleukemia – red blood cell leukemia. Its envelope is both a neurotoxin and an oncogene. It causes cancer and causes toxicity. This virus itself – she had this antibody that was highly specific. It recognizes all known polytropic and xenotropic viruses. We hypothesized that it would recognize this virus and clearly high levels in some patient's cells, but not in others. Interestingly enough, if you look, and use a panel of antibodies, this is a gag antibody to a gag protein I showed you there, that structural gene and this virus, this antibody is a polyphone virus that recognizes the entire MULV. And you can see when you use a panel of antibodies to the viruses, essentially everyone, 68% now of 50 people we tried just one time, you could see their proliferating blood cells. You can see evidence of viral proteins.

[SLIDE 15: Absence of XMRV Protein Expression…]

We next asked if we could see this in normal cells, because of course you want to make sure that it's not in normal people. And you can see clearly here in the 24 normal donors (now up to 60 or 70 that Frank's done) at the NIH clinical center where they have a good donor program – they're all negative. So, these proteins, these viral proteins are expressed specifically in the CFS patients and not in normal donors.

[SLIDE 16: Transmission of XMRV from CFS Patients…]

We next asked if we could transmit that. Is there any evidence that it's an infectious virus? So the first thing we did was we took plasma – so that's the plasma, the liquid off the white blood cells there – and we took their plasma and [this becomes essentially the key to the whole study] we co-cultured it. We simply put it in a flask with the cells known as LNCaP and that abbreviation comes from lymph node-cancer-prostate. This came from a lymph node of a 62 year old man who had metastatic advanced prostate cancer. And these cells grew by themselves in the laboratory so that you could use them as a tool for studying prostate cancer. And, in one of my lives, I developed prostate cancer drugs, because, when my stepfather got ill, I became interested in prostate cancer and had been working on this. So, I knew LNCaP was also deficient in RNase L, and the type one interferon pathway. It had no interferon response. So, we always look for biological multiplication of the virus instead of the multiplication you would use with PCR. So, actually replicate the virus or multiply the virus in cells. You have to find a cell that will grow a lot of virus so that you can study it. So we took that plasma from all of these patients. You see high levels – now 84% of the plasmas contain infectious virus that we could not see. I sent all of these plasmas to Bob Silverman and he said, "Sorry Judy, I don't see the RNA of the virus" there when he looked for the two copies of RNA in the particles which suggested there were very few copies of actual particles of virus in these cells. But again, we could transmit it.

[SLIDE 17: Transmission Electron Micrograph…]

And the next question we asked is: Is this a whole virus? Is this an infectious virus? Kunio Nagashima, my friend at the NCI who is an expert in Electron Microscopy, did this electron micrograph for me, and what you can see here is the budding of a virus from the cell. It shows you again that it's not a contamination, it's actually a transmission, because you've got a budding particle. And that particle is called a C-type retrovirus, because in the old days, when we used the word, they called them 'C' but they changed the name to gamma, but we're old-fashioned, so we keep the 'C' type.

And what you can see here, characteristic of a gammaretrovirus, you can see this budding – remember I showed you it takes the cholesterol and buds itself out of the cell to form the outer membrane. And here's that capsid that encloses where the viral RNA is, to protect it. So you can see both immature particles and many mature particles in those LNCaP that have just been exposed to patients' plasma, showing there is an infectious virus there. So the next thing, so we were pretty happy with this and we sent it off to Science in early May of last year, and they came back to us and they said, "We're 95% convinced, but show us an immune response. If this really is an infectious, non-self virus, not an endogenous virus, your body will make an immune response."

[SLIDE 18: Antibodies in CFS Patients' Plasma…]

Again we went to Sandy Ruscetti, and this part was funny too because we were struggling to do this, because you don't want a whole virus infected cell, you need to have just a part of the virus in order to get the noise out of there. And what Sandy had developed when she was studying the spleen focus-forming virus was this antibody again to the envelope protein. And she expressed it on the cell lines – used two cell lines. This is a mouse b-cell line that expresses the erythropoeitin receptor (it's just for red blood cells), and when she co-expressed the envelope, you see high levels of the envelope on the surface of these cells. So we took these cells and put them in what's called a flow cytometer, where a laser will see the fluorescently tagged antibody on the surface of the cell and count the infected cell as it runs through the instrument, the channel and single cell. So you can see that the cell line went out the envelope protein being expressed. You see the white and the black are superimposed showing that there's nothing reacting specifically with that. If you then take that antibody I showed you, to the envelope, its called 7C10, and expose the cells to it, they all light up, virtually 100% of these cells have the antibodies that are recognizing the cells with the envelope protein. If we then take a patient sample and do exactly the same thing, you see there's an antibody, this is for patient number 1104, that's one of the sequences we have, and there it is, there's the immune response in the plasma, showing now we have an infectious virus with particles that can exogenously infect and is non-self.

[SLIDE 19: XMRV is Present in Malignant Prostatic Epithelium…]

The next step in what happened in the literature is work in prostate cancer again. So this comes from the lab of Ila Singh, who's an MD-PhD at Utah, and she was looking at XMRV in malignant prostate cancer tissue in the tumor cells. One of the other reasons why the oncologists in the cancer community weren't

excited about Bob's discovery of XMRV sequences was because, when they looked at those, they only found them in the infiltrating stromal cells – the microenvironment. But those of us who think a little deeper than most oncologists about cancer know that 50% of all tumors are actually your immune system, your white blood cells, going in to try and clear the cancer because that's their job is to recognize tumor cells. So we weren't concerned. We were excited that it was, and it made sense to us that it wasn't the tumor cell itself harboring the virus, but the immune cells that were inside the tumor.

[SLIDE 20: Fluids from XMRV Positive Prostate Cancers…]

But Ila showed that XMRV WAS present in the malignant tumor cells and that it was associated with that high grade tumor, that tumor that my stepfather died of, that you get younger, and they get really sick really fast. And what was different in the advance in her study is she developed an antibody specifically to XMRV, to the whole virus, another polychromal antibody. And she showed that she could recognize with that antibody, in what's called Immunohistochemistry. When you send a biopsy to the lab, they look at it, at a tissue block. So she did that, and she showed that 23% of the prostate cancer tissues she looked at had a protein to XMRV, a lot like our study, but she saw a lot less DNA sequences than she saw proteins. This paper came out about a month before our paper, but we knew about it from about mid summer when we first met.

In her study, the limitation in her study, was that again that there is no evidence of the infectious virus that I just showed you. So we had evidence of infectious virus in CFS. Can we see evidence of infectious virus in prostate cancer?

[SLIDE 21: Transmission of XMRV in LNCaP]

Frank did this, this is again that antibody, looking for the antibody in the patients. And here he used, this is called a prostatic secretion, so they're just looking at the prostatic secretion and when they had a person who had sequences of the virus, positive in the prostatic secretion, you can see there that there are antibodies in that patient, so that patient is infected. In an XMRV PCR negative patient, we don't see antibodies, so that person is unlikely to be infected with XMRV. And again in the plasma of this integration here, so that now they have actually found in this patient exactly where the virus integrated into the cell, and that patient has a significant amount of antibody. In prostate cancer, no one had ever transmitted virus and shown that it was infectious that way. I show you the exact same study, where we took the plasma from the prostatic secretions there and found high levels of the virus when we put it on LNCaP, showing now in both prostate cancer and CFS, that XMRV is an infectious virus. And in a significant portion now they are finding in prostate cancer patients.

[SLIDE 22: PCR is not as Sensitive a Detection…]

Why bring that up today, is because if we look and we do a summary table of the technologies that I showed you that we used to find the virus, what you see is that patients here in red are clearly infected when you look at plasma antibody responses, and you look for transmissions through infectious particles in the plasma, you can see the red patients both in the prostate cancer and in the WPI patients. These patients were PCR negative, I bring back to you 1118, but we found plasma transmission of that virus that I didn't point out, pardon me when we passed that slide. But ALL of these samples were negative when you did the most sensitive PCR that Bob and everyone developed in unstimulated cells. So those white blood cells, fresh out of the body, not dividing, very low copy numbers of this virus, but clearly these individuals are infected.

[SLIDE 23: What is the Incidence of XMRV in Prostate Cancer and CFS]

Going back to the literature now, two studies have come out since then, and one was in October, right around the time our paper came out. And this was from a German group led by Norbert Bannert, and he found a lack of evidence for the virus in over 580 prostate tumor tissues, when he used the sensitive nested gag-PCR techniques that me and Bob and everyone is using right now. And he had developed his own ELISA which is looking for an antibody in the sera – it's a similar test to what I showed you for looking for antibodies to that. And he couldn't see any of the evidence of the virus in those sera, and so he concluded, they concluded that XMRV was not in prostate cancer. And then earlier this year, a similar study came out by a group in England that showed a failure to detect XMRV in CFS. And they looked at 186 DNA samples, and they did nested gag-PCR and they found nothing.

[SLIDE 24: What is the Reason for Discrepancy]

What could be the reasons for the discrepancies in these studies and what we've shown you in the studies of Ila Singh? First of all, the prevalence of XMRV, that's the distribution around the world, is unknown. The studies that we've shown you today is all we know about XMRV prevalence – that it's in the US and in several hundred people including those with both prostate cancer and CFS. But I remind you that retroviruses are not ubiquitous, they're not everywhere. The sensitivity of the assays in these studies was not the same because both of these studies didn't rely on (inaudible), they relied on PCR, they didn't look for infectious virus. Of course the Bannert group didn't know our study because the papers were under consideration at the same time. And then also that XMRV has an extremely low copy number that I showed you, that even if it is there, you could miss it by these sensitive techniques. And mostly importantly, and something that didn't occur to me until I saw all of this data, was that we don't know anything about the viral reservoir of XMRV. I assumed it's lymphocytes because that's what I know about HIV and HTLV-1. But what if the plasma virus was coming out of the tissues, and then the cells that were actually in the peripheral blood were not the main reservoir of the virus? What if there is another tissue reservoir? We don't know what that is, so these are all possible explanations for why we saw it, and we see a lot of it as you see in the plasma of these people, not a lot by copy number, but certainly there is infectious virus there. So that's what we're thinking.

[SLIDE 25: Distribution of HTLV-1]

If you look at data that supports these arguments, what you will see is the distribution here of HTLV-1. Now HTLV-1 infected people are 10-20 million across the world, and I bring up this one point that HTLV-1 causes a neurological disease known as HTLV-1 Associated Myelopathy. They have trouble walking and balance and almost like a paralysis looking disease. And that occurs only in about 20% of the infected individuals. And then of course HTLV-1 was shown to be causative, satisfied Koch's postulates as we know them for viruses – for an adult T-cell leukemia, and this is a very aggressive leukemia, and the mechanisms for how it causes that are still largely unknown. But at any rate, 10-20 million people are infected, but you see very few – only sporadic cases occur in the US or Europe, and the US incidence is only about 0.2%. They don't even test for it in the blood supply because it's just simply not a problem in America, its endemic in the regions that are shown here today.

[SLIDE 26: Transmission of XMRV from Activated PBMCs…]

And the second argument that supports maybe what's different between these studies is the transmission from the active PBMCs. So if I take the white blood cells, some of which where I can't see virus and just put them on LNCaP, I can transmit the virus to this indicator cell-line that has shown you because its defective in RNaseL (theoretically because its defective in those, but we learn more about it later), will amplify and replicate high levels of the virus. There are scientific reasons why there are differences between these studies, but I don't think there is any doubt that XMRV is a new human retrovirus, and since both HIV and HTLV-1 are associated with neurological diseases and cancer, and now we have associated them with a neurological disease and cancer

since both HIV and HTLV-1 are associated with neurological diseases and cancer, and now we have associated them with a neurological disease and cancer, that this is a real human pathogen.

[SLIDE 27: Recent Publications – Clues to Pathogenesis]

Recent publications after those publications (I'm just walking through the literature off the last few years) might give us a clue to the pathogenesis – how XMRV might cause disease. So this paper by Steve Goff's lab shows that XMRV establishes in an efficient infection, and spreading infection, that's enhanced by transcriptional activity in prostate cancer cells. And what that means is, I told you the receptor is on every cell of the body, but clearly every cell doesn't have the machinery necessary to replicate the virus to high levels. In fact we see that the peripheral blood mononuclear cells really don't, and that's why we don't know where the tissue reservoir is. So he simply infected a lot of different cell-lines, and he found that the expression was very very low level, except in essentially one cell-line, and that's LNCaP. So we got very very lucky in that this was the only cell-line I thought about as an indicator cell-line. We could have screened the hundreds of cell lines I know of that we do regularly when we're looking for viruses because if you can't grow it you can't study it.

[SLIDE 28: Hormones and Inflammation Increase Replication of XMRV]

LNCaP turned out to be really serendipitous, and I think the key technical advance to being able to make that discovery, it's just clearly luck. He showed that LNCaP responds to androgens, I told you it lacks interferon and RNA cell anti-viral responses, and I'll show you what's called the promoter, the response elements, that might give us a clue as to the pathogenesis. And then Bob Silverman's lab showed the same thing. He showed that androgens stimulate transcription which is the replication and division of the virus. Here's a clue to the disease because we know the only two diseases so far that are associated with this retrovirus are prostate cancer (a hormone responsive disease) and CFS (one that's thought to occur primarily in women).

Interestingly that I didn't say that I knew LNCaP is androgen responsive. So you can make it do a lot of good things and that's why we use it in drug development for prostate cancer. Let's look at that organization of the gag, pol, and envelope of this simple retrovirus. This U3 region is highlighted because this is sort of the on/off switch of the virus. This turns it on to make more of the particle in your genome, so this signals your cellular machinery to start making more virus, and what Steve Goth's lab showed (and he graciously gave me these slides about mid summer) was that there's only three responsive elements that turn on this virus that he can find so far.

Two are called glucocorticoid response elements and they're shown here. When a protein actually recognizes that exact sequence and sits down, it tells the virus to turn on replication. And so interestingly enough, what turns on the virus? Hormones. Progesterone, androgen receptor, and testosterone, and we don't know all the other hormones. There are a lot of estrogens and estrogen-like compounds, even in our environment these days, which might tell us maybe there's an estrogen compound that's not a naturally-occurring, estrogens in a plastic, in the environment, that is actually turning on the virus.

We don't know all of the things that turn it on at this point. And the other thing that turns it on is cortisol. What is cortisol? It's the stress hormone, and so right there you're turning on the replication, so it's an on/off switch for the virus with the stress response. When you're told that you respond poorly to stress, there might be a reason for that if you're replicating a retrovirus! (laughs). Sorry I shouldn't laugh.

[SLIDE 29: Clinical Research Findings]

Then we went back into thinking about this virus, we thought about the clinical research findings that had occurred throughout laboratories around the world throughout the years. What it mentioned in part was we know that CFS is a multi system disorder (and in Spanish I say sequelae), but there's lots of inflammation going on, you have allergies, multiple chemical sensitivities, there's a lot of inflammation, and increased numbers of activated T cells, and the production of these inflammatory molecules I mentioned known as cytokines and chemokines. Also a key dysfunction in the immune system of CFS patients is this low natural killer cell activity and sometimes numbers.

The natural killer cell has two jobs in the body: kill tumor cells and kill virus infected cells. In CFS, it's long been recognized (I think first identified by Nancy Klimas and her colleagues more than 20 years ago) that natural killer cells in CFS patients don't function normally, although the dysfunction is not known, but that again gives us a clue to the pathogenesis. So this suggested to us that this chronic infection with a retrovirus (retroviruses are associated with immune deficiencies) might lead to the creation of actual immune deficiency that has patients susceptible to opportunistic infections and more likely to develop cancer.

[SLIDE 30: Hypothesis of XMRV Pathogenesis]

I've schematically drawn our hypothesis on the next slide, and I basically just lifted the graph of what happens in HIV and changed it to what we know happens, and changed it to all the data that we have so far. In HIV what happens is that there's an early infection, the green line is actually the plasma viral load, and it goes up in a spike. This might be a flu-like syndrome, or it might be nothing at all. You might never know that you were actively infected at this point and get sick. But then you have multiple other infections, stress hormones, advanced inflammatory responses that cause these various spikes of the virus throughout a time course which we don't know.

I've heard the incubation period of HIV virus is 21 days. We don't know anything about the incubation of this virus, we've just discovered it! At any rate, all these events operate to set the viral load higher, because every time you divide a cell, that your white blood cells, the cells in your immune system, and actually our paper shows it's the TB and NK cells are infected. Those cells are getting infected, more and more and more of them, and some of them are long live memory cells that you need. Or they're going to the tissues then, and they're infected, and they're spreading the virus to other cells, and we don't know where that tissue reservoir is, and as I said the receptor theoretically is on every cell.

Not every cell can replicate the virus, but virus can get into every cell. So it's infecting more and more NK cells, as the load keeps coming up, and at this point, something happens to your NK cells. This envelope antigen comes to very high levels, like we see in our patients' plasma and white blood cells, and we know that in animal models or in animal viruses of this family is actually a noctogene and a neurotoxin. We hypothesize that the envelope alone is creating some of the neurological sequelae, and that they're different from the virus replicate. So it can be sort of the envelopes around a lot more, I showed you the defective particles with less infectious virus and more defective virus, but those proteins can affect your body.

We know you're making antibodies, but some of the sicker patients don't make antibodies, and CFS patients are known to have problems with antibody production for whatever reason. We're not saying that's direct to the virus, but you know it's not a great leap of faith because that's what we saw in the early 1980s with AIDS patients. We had no idea how long those men had the virus.

All of a sudden, they were getting Pneumocystis and Kaposi's sarcoma (a form of cancer that only occurs in older men in Italy), and that's because, as you age, your immune system loses effectiveness too. All of a sudden we're seeing a virus that is not endemic in the United States. Well actually from these

patients, they actually identified HHV8 (Human Herpes Virus 8) which actually is causative for Kaposi's Sarcoma, and that virus, I led a drug development program about a decade ago just before I came to California, and we were going to make drugs to target AIDS-associated malignancies, and we found as soon as we got the highly active anti-retroviral therapy and got rid of the HIV and silenced that, the Kaposi's Sarcoma went away, as did the HHV8. They cut the budget for that drug program and rightfully so, because there's no need to develop these drugs because they learned that, at that point, all you have to do is control the retrovirus, get the immune system back to functioning, and also the good news is most of those men, their immune systems are functioning well. You can get a lot of them back to at least a level of health, even though they have to stay on various drugs the rest of their lives. At least they could cure the immune deficiency.

[SLIDE 31: XMRV – A Human Gammaretrovirus of Unknown…]

In summary, then, of the science part of the talk: XMRV is the first simple human infectious retrovirus. It's a gamma retrovirus; it's not complex, so it's the first one known in this family, and we know nothing about the pathogenic potential, other than the two diseases that we've seen it in. We know that human retroviruses are not ubiquitous. I've shown you the distribution can be quite low in various places in the world. We don't know how it spreads across continents.

They're not benign, meaning they cause disease. All three known human retroviruses are associated with neurological diseases and cancer. And importantly, they are not airborne, retroviruses are not contagious, you don't get them in the air. We know that, for instance, with AIDS patients, that it's not a problem to kiss AIDS patients and hug AIDS patients, and so that knowledge is there for this virus as well. So there's 3 known now, the complex and now the simple, and I've mentioned that a number of times. Interestingly, and something we should think about, in light of the replication studies and the other studies as we're going on, I say HIV and HTLV, but I've been saying one, but there are variants of HIV. There's HIV2 that is less pathogenic, there's HTLV-2 that is less pathogenic, in fact hardly pathogenic at all. And these are clearly different and have different pathogenic profiles, and just a short extension of that suggests that there could be variants of XMRV. There could be subtly different sequences of viruses out there that are associated now with different phenotypes, so the way the disease looks, and different cancers or different neurological diseases.

I know that the scientific community is actively looking for variants, so another good news about these studies is that there are a lot of excited retrovirologists and immunologists who started as soon as they learned this in July, to the put the world resources and the best minds on this virus associated with CFS, and that's probably the first time that's happened in the world, so they're excited about that.

[SLIDE 32: Personal Reasons to be Tested]

A lot of the questions that I got, and I wrote this talk around the question that I got, had to do with reasons to be tested. You know we don't have the best diagnostic test yet because we still haven't validated that serology test. That serology test is done in a laboratory; it's very cumbersome, we need to validate it clinically in order to look for antibodies in the population against this virus, and that is the number one test when you go look for HTLV. But that said, there are opportunities to get tested, and you might have your own reasons to get tested. Now generally a physician won't test because there are no treatment options. There are no known anti retrovirals currently that are known to be good for XMRV, so why go get a test for it if you can't treat it?

But it can give you additional validation that your illness is an organic illness, and that can have a huge psychological boost because you can begin then to think about immune support and things you might do and changes in your lifestyle where you may be able to support your immune system in the meantime while we develop drugs. And importantly, you want to protect your personal family and public health. We need to know where this virus is. And it does help, physicians then start to see, physicians like Dr Peterson, will know how that might relate to your other infections, your other immune issues, if you have cytokine profiles in some of the tests he does. It might help him or some of the other physicians with your therapy to know that this is a player in the game now.

And again it underscores the more people that are infected, that 3.75% is 10 million Americans, so that I didn't have to say anything. The drug companies called me the next day and said "Gee we'd like to help!" and so we're actively working with them, and they are helping because there's another piece of good news which is that there are drugs that were on the shelf that were developed all the way through phase 2 clinical trials. They were shown to be safe in people, but they just didn't work as well against HIV as the drugs that were out there. Why spend a lot of money developing them? There are real targets that you can go after that can serve regions between these viruses right now and maybe come up within the next year with a drug and a clinical trial for that drug that would go a long way toward treatment.

[SLIDE 33: Preventing the Spread of XMRV]

Right now we recommend, to prevent the spread of XMRV, if you have CFS and you wanted to be prudent, even if you didn't get tested say "Okay I might be infected." What would we recommend? The HIV precautions, because it's a retrovirus we know it's spread, we found it in blood, in the body fluid secretion, and prostatic secretions. You just want to assume that these precautions that are very stringent, and have prevented the spread of HIV in some countries, that if you don't donate blood or sperm (this virus can infect sperm cells), so if you have CFS or maybe a history of aggressive prostate cancer in your family, you might think about not being a blood donor.

Follow the HIV precautions. Don't share toothbrushes, because you can have bleeding gums or razors. Use safe sexual techniques, and do not breastfeed. It's 'don't breastfeed after six weeks when the maternal antibodies go away.' When they did that in Japan where ATL (that aggressive leukemia) was rising in the late 70's and early 80's, all they did was say "Okay, no breast feeding!" and 40% reduction of ATL rates in Japan. So prevent the spread of this virus, and you can reduce the disease and protect your family.

Part 2: Transcript with slide citations of the Jan 22 Santa Barbara XMRV Seminar by Whittemore Peterson Research Director Dr. Judy Mikovits – compiled and edited by long-time ProHealth subscriber and contributor Sandy Miarecki. (To return to Part 1, click here. To download the slides, click here.)

[SLIDE 34: WPI Research Priorities]

What are our research priorities? At the WPI, we're actively working with the federal government to develop that next generation of tests. We expect that serological assay (Rachel will get mad at me) within a month. She told me yesterday that the data were looking really good. And we want to investigate the prevalence of XMRV. The federal government – the National Heart, Lung, and Blood institute – actually called as soon as the paper came out, and we set up a Blood Working Group to investigate what is the true prevalence. Prevalence means the presence, the distribution, not necessarily the disease; and we use incidence with disease, and prevalence of XMRV in the blood supply. Our numbers were small – they were only 200 or 300, that's 4%. But 4% is still 10 million Americans, so you want to look at that, and they actively are. And they're working on that second generation test as well.

We want to understand those tissue reservoirs, and clearly it may not be the PBMCs (peripheral blood mononuclear cells). Is it the lymph nodes? Is it bone marrow? It's possible (I don't expect it), but it could be the brain. We don't know at this point. We are actively working, as I said, with drug companies to

develop anti-retrovirals and immune based therapies.

We want to understand how it's transmitted. We've got a family study going on in the research plan; it's just getting IRB (Institutional Review Board) approval and ready to start. Hopefully we can get families who have any number of diseases across the spectrum, fibromyalgia, other neuro-immune diseases, maybe a higher incidence of cancer, but we need healthy people as well, so we'll take essentially anybody into that protocol. And, as I said, that protocol will help us investigate the incidence of XMRV in other neuro-immune diseases.

[SLIDE 35: Questions]

Important questions that the field is working hard to answer (and we are as well, but we won't be able to do all this):

• Is XMRV a causal factor in CFS, and possibly some aggressive prostate cancer? And we'll talk a little bit about how you think about a causal factor. One way to do that is, we have several patients who came to Dr. Peterson, and they said "I was fine until I got into a car accident. I got a blood transfusion in the hospital and I got CFS" or "I had a surgery and had a blood transfusion." So if you can identify a blood transfusion exchange of an acute infection that causes the disease, and the virus wasn't there before in the human, and it's there afterwards, and it's in the donor, then of course you've got causality, and that is one way that causality was shown in HIV as causing AIDS. I think we all know the tennis player Arthur Ashe, and that is how he got HIV/AIDS and subsequently died.

• How does XMRV enter the human population? Is it a zoonotic [from animals] transmission? We know it's not a mouse, at least not any of the mice we know. It could be a field rodent of some kind, but we've never found the virus in another animal. This is the first animal that is the "Xeno," and that is man. So, how does it enter the population, and when did it enter?

• What's the worldwide incidence of XMRV disease; that should say, "or prevalence" of XMRV. Where is it? Is it in England, in Europe, at what level? We know it's 1.7% in Japan because of a study done earlier this summer.

• And does it alter the risk of cancer development? Because HIV & HTLV-1 both, by causing immune deficiencies, do.

[SLIDE 36: WPI Collaborations International]

A lot of people wanted to know: are we working internationally to replicate the studies? Everyone you see on this slide, a lady in Canada, part of the blood group in Canada also had called me since the study came out. We've been working with Jonathan Kerr, and we have a 5-year RL1 with him. Ellie Barnes is in MRC in Oxford. Norbert Bannert on that German paper, he was working with an advocacy group led by Regina Koch, I think, and they found a few samples that were maybe positive. So he called me and said "Can we work together and have that antibody?" Again everybody you see on this list, Jonas Blomberg in Sweden. Norway, Germany, the Netherlands, Italy, Spain. We can't handle the samples we've got so far, but we'll try, and we'll send the reagents out to anybody to replicate the work and find out more about the disease.

[SLIDE 37: Additional Incidence Studies]

We also know of additional incidence studies that we're not involved with but are occurring at Kiel University, again in Germany. And here in the USA, Sam Chow is working and has identified the virus in China, and I do know that Richard Huber has had success at finding virus in CFS and other patient groups. And of course I mentioned that blood working group that's working throughout the United States, and I didn't list the number of US collaborators we have. There is a lot of interest. A lot of the world's best labs are working on this, and we're going to get there a lot more quickly than we would because of everything we have learned from HIV.

[SLIDE 38: XMRV Clinical Diagnostic Tests]

What about Diagnostic Tests? Should your physician or you want to be tested currently (the last time I looked online), there were only 3 companies offering the diagnostic test. Of course the WPI licensed the technology to VIP Dx (we're a non-profit institute), who is using our proprietary culture method and PCR, in combination along with a Western Confirmation. So, we look for both antibody and PCR positives in the cultured and co-cultured cells. And we use 20 mls of blood to do this, and make sure of the accuracy of the result, and the price is $450. Clongen lab has a real time PCR that is just looking for sequences on 1 ml of whole blood, and their price is here [$375]. You won't find this virus in 1 ml whole blood by PCR. I think I've shown you that with the negative cases in the prostate cancer. And also a company known as Cooperative Diagnostics in South Carolina. We don't know what their PCR method is, but they're using a drop of blood on a piece of paper. So, they tell you if you put a drop of blood on a piece of paper, you don't need a doctor or anything, just send a check, and of course they won't find anything.

[SLIDE 39: Your Help is Critical to Advance the Science]

Your help is critical to advance this science. At the WPI, we either want your money or your blood. That's the only two choices! We need you to participate in these research studies, and we have a form online where you can register: https://www.wpinstitute.org/patient/volunteer_form.html, and you can email me.

We're asking for some clinical characteristics, but we're asking for those more to help us put it in a study. We won't turn anybody away. We will look for the virus, if we can get those studies. We're waiting for the IRB approval, that's the human assurance to make sure we're not hurting you and we're protecting your privacy. So, we expect that this week.

Donate funds to the WPI research and clinical programs that will be established later this year. The clinical programs will really come from the research and the diagnostics. And then write to your government officials, and encourage them to support XMRV research. This is an infectious disease. Why isn't the National Institute of Allergy and Infectious Disease considering this virus? They've been pretty quiet, haven't they? We haven't heard a word from them. So, we need our government agencies to look at this virus because it's an emerging infection, as I said, of unknown pathogenic potential.

[SLIDE 40: Acknowledgements]

I'd like to thank the people who – we couldn't have done this study without them. This has been a 3-way collaboration between the National Cancer Institute and its contractor SAIC, Cleveland Clinic, and the WPI. As I said earlier, when Vinny Lombardi and I, together with Max Pfost, first saw the few sequences of the virus, I called Bob [Silverman] because obviously we were doing the work with him, and then I called Frank [Ruscetti], and said, "I need you," and he said, "I won't go," and I said, "I'll pay your way to San Diego on the beach for a week!" and he said, "Not any more of your schemes, Judy! I'm not going to do that again!" At any rate, we met at a restaurant, and we showed Bob, and he didn't know what I was going to tell him. Interesting, Frank's a bit cantankerous because I gave him about a week's notice because we'd had 3 weeks, and I was pretty sure I knew what we had. We had to get a 3-way inter-institutional confidentiality agreement. Frank called the office in the government, and they said: "No, we're not going to do that," and he said, "Look, we're talking next

Saturday. You can either have a confidentiality agreement or you won't," but they got one. So Frank and his lab, like Dan Bertolette, did every one of those beautiful Western's that I showed you, just a magician. Mike, Dean, and Burt Gold sequenced the entire RNAse-L gene in more than 100 patients. Ying Huang did all of the PCR that we had done, totally blinded, where samples never came to our labs to show it wasn't contamination.

And, of course I've mentioned the lab of Sandy Ruscetti, Charlotte Hanson, and Jami Troxler, who were key in providing all of those reagents, without which this study clearly wouldn't have been done. Cari Petrow-Sadowski developed that immune-response assay in a real hurry this summer, and I mentioned Kunio & Rachel, who did bioinformatics support and electron micrographs. We couldn't do it without Dan Peterson's diagnostic skill. I mean, he biased the patients such that we could find the needle in the haystack, but these are the patients that come to the institute. They have classic symptoms of CFS. When we have taken patients that have emailed us with exactly those same symptoms, we find the virus every time we look, including in Europe, in England, Ireland. We couldn't do it without the CFS patients and advocates. We do so appreciate the support all along.

This was a tremendously difficult year in trying to keep quiet. Knowing what you had and don't say anything until you are sure you're sure you're sure. Every day was just, "are we sure?" And so, we were able, with the small crew you see here, and this supportive staff. Vinny, Katy and Max – they pretty well have worked 24/7 for at least the last year… So, at any rate, with that I'll thank you for your attention and take questions.

QUESTIONS – Audience Q&A Session

Question: Before any of the questions, I just wanted to say thank you because through your work and your collaboration, you've brought more excitement to the CFS community, you and your collaborators have, than in 2 decades. And you've also brought more interest in the illness than we've probably seen ever, so I thank you.

Judy Mikovits: You're welcome. [Applause]. That's interesting, because the reviewers of the paper didn't really know what CFS was. They said: "oh, that's a poorly understood and complex disease" and they went on to the virology. So we were able to get that reviewed without any kind of bias. And I think that was significant as well.

Question: What percentage of the population has this virus?

Dr. Mikovits: We found it in 3.75 percent of the U.S. population, and it was from across the United States. And in Japan they found it, just screening the blood supply of a couple thousand people, they found it in 1.7 percent. So we don't know the true prevalence.

Question: So, only in 3.7 percent? What about the other 96 percent of CFS?

Dr. Mikovits: No, that's the healthy population. It's in 90-some percent of the CFS population. I stuck this slide in here, and Frank keeps taking it out, but you might have heard in the press after the paper came out, we didn't do all of the tests, all four tests, on all of the people prior to the submission in May. We just looked for evidence of infection and looked to see if we could isolate the virus, looked to make the point, and it wasn't so much about the CFS.

What we did, after the paper was published, we went back and we looked with all four assays for evidence of XMRV in those PCR negatives. Because now we know that indeed those negative samples may have evidence of infection, and what we found was that 19 of the 33 had antibodies in the plasma. We found transmissible virus in the plasma of 33 of those people, and then we looked at that latent virus because the company I used to work at here in Santa Barbara was called Epigenics, and it was developing methylation-inhibitors for epigenetic silencing, and that's what happens to viruses. So we used Decitabine, which is a demethylating agent that opens up the genome and turns on the virus and found that there was latent virus in 10 of those people. And when we summed it all up and tabled it out, 99 of the 101 patients in the Science paper had evidence of XMRV infection. Another way that HIV/AIDS causality was established was by saying, "So, the statistics of this means there's a 10 to the minus 35 chance that you had CFS in our study without having XMRV." So I'll go back to the AIDS analogy. You can have HIV. So, we wrote in the paper "virtually impossible," and the editor took it out. We wrote, "highly significant." The editor took it out. Finally we said, "significant." But at any rate, 35 zero's in front of a 1 would tell me it's virtually impossible to have had CFS without having XMRV in this study.

So, you can be infected with HIV and not have AIDS. We know that. People are being treated. A lot more elite-controllers are coming out, but you can't have AIDS without having HIV. So if we can establish that XMRV is to CFS as HIV is to AIDS, which is what we're trying to establish through that immune system understanding. So HIV kills CD4 cells and leads to AIDS. XMRV does what to the immune response? To the T, B and NK cells to lead to CFS? To turn your question around, sir. What about – the incidence of CFS in this country is 1 to 2 million – is that more or less what is said? By the Canadian or the Fukuda criteria? So I said 10 million people were infected. Where are the other 8 million? Do they have cancer? Do they have nothing? I showed you that only 20 percent of HTLV-1 infected people were actually sick with one of those diseases.

So you can be infected with retroviruses and be carriers and not be sick. And that's one reason to be tested. If there is a genetic susceptibility, which we're looking to, maybe a reason, an immune defect that was unknown as to why some people get sick and others don't. You certainly want to know where the virus is, so if you're a carrier you can protect your family.

Question: Do you know how many have tested with VIP-Dx, and how many are positive?

Dr. Mikovits: I don't work with the company. They only take samples two days a week because it takes three days to do that, so they've done hundreds of samples in the last couple of months, and at least half of them are positive. Or 40 percent. And again, their doctors are looking at, the doctors who are well versed with CFS, so they're immediately sending off. Dr. Cheney, Dr. Klimas, a doctor in Canada, Ellie Stein, maybe even Susan Levine in New York. I'm not sure, because it's illegal for me to know those data because there's confidentiality between the patient and the physician. But quite a number and, yes, it's there.

CFS is a heterogeneous disease. I mean anything based on fatigue. So certainly everything is not going to be this virus. But maybe there is a disease, and of course that's what we're looking for, biomarkers for understanding how you can get sick and be sick forever and not have drug targets, not have diagnostics. Certainly there are going to be lots of people who have what might be called CFS today, and that's why we've also coined the term XAND, for XMRV-Associated Neuroimmune Disease, and that would be because we've seen (inaudible). I had done a number of studies with family members after the paper came out and prior to now, where I just said there's a family member where the children have autism, there's fibromyalgia, there's excess cancer, and when you look, you find the virus. So, we've found the virus in Atypical MS. Atypical MS is a non-demyelinating MS – it looks like MS, it has some brain lesions like MS on SPECT scans. At any rate, I'm not a physician.

Just looking at families with different types of neuroimmune disease, we started seeing that the virus was there, and so that's why we started thinking it might be involved in a broader spectrum of neuroimmune diseases, with overlapping symptoms because in fibromyalgia, pain is the primary symptom, but, in a lot of people, it's this body-numbing fatigue, so fatigue goes along with it. In fact, Cindy Bateman, who's a fibromyalgia expert at the University of Utah,

says fibromyalgia is CFS with pain, and she can distinguish those who get better with fibro with certain therapies and compounds, and she takes the others away who don't respond at all, and puts them more into the CFS group. So definitely XMRV is not going to be everywhere. It's not – it's 4%, but the people who are infected are sick.

Annette Whittemore: Earlier you said that 40% were positive. So describe the fact that if you're positive, you're positive. But if you're negative, you're not necessarily so?

Dr. Mikovits: Yes, that's correct. I answered that question based on the samples that came through there. Everyone who is positive is definitely positive for having the virus. But we don't know what the people are, what the doctor is sending in, so the people might not have that disease. So it could be a clearly, distinguishing delineating marker – biomarker – or diagnostic at that point for various diseases. So a doctor might see a spectrum and say "I don't know, maybe I'd better check." Because the earlier you catch it, just like cancer. Early detection. Make sure the reservoir is (inaudible), make sure you don't have that virus multiplying, and you can live a normal life. Don't let it get (inaudible). You know the commercial out right now is "HIV doesn't have to equal AIDS"; well XMRV doesn't have to equal disease. If we keep it down, we keep the immune system strong.

Question: So what you're saying is you may test negative but not be negative?

Dr. Mikovits: That's correct. If you do it by the PCR. If you do it by VIP-Dx, at least right now, it's running along the lines of (inaudible). We've got the antibody, and we've got three of the four tests. We'll license it to anyone. We're a non-profit institute, so everybody pays the same royalty, so any diagnostic company could do the gold standard. But right now, if you test negative, you're not necessarily negative, even at VIP-Dx. Because we want to go do that serology test. Maybe we can't find evidence of the virus. But you've been exposed, which would be a good thing because your levels are theoretically low, and you've just now made the antibodies, so you can prevent disease, as we did with Magic Johnson. But we don't know anything about the immune response to the virus.

Question: What about transmitting it, when you get pregnant, to a child? I mean, you were talking about breast feeding?

Dr. Mikovits: Well, it is theoretically possible. We don't know. Gamma retroviruses are vertically transmitted, so the egg and the sperm can be infected and you can actually vertically transmit gamma retroviruses. But this is the first (inaudible), we've only studied it for two months. We don't know. Theoretically it's possible. If we make those data, it will certainly fall out when we start looking at family studies. The horizontal transmission is the only thing we know about right now. Because, of course, you have to find somebody who just gets infected in order to understand the disease. And since a diagnosis of CFS is being sick for six months. Well, if that's the only thing we can do is to stop that practice, making somebody wreck their immune system, or be totally sick for six months, that would be a great thing with the discovery. If that's the only thing that comes of it.

Question: Would you not recommend getting the test again if you did [test negative]? I just took the blood test with my doctor… and he's part of a study. He didn't tell me who he sent the samples to, it's a 20-patient study, so if that came back negative …

Dr. Mikovits: It depends on where it is sent.

Question: Take, for example, VIP-Dx?

Dr. Mikovits: If it's at VIP-Dx, as soon as we have the serology, we'll go back and do all the negatives. We save them… We do isolate virus from all of them, but it costs a lot. So if they're really negative, we won't isolate virus either. That's correct. At VIP-Dx, we're going all the way to virus isolation, because we want to make sure we are sure.

Question: So, at a non VIP-Dx?

Dr. Mikovits: They're only doing PCR. All bets are off. I showed you almost 60% of them are probably, they're all false negatives, because very few people can find them. And participate in our research studies, because as I said, there's no hurry. There's no real reason to pay for a diagnostic test because we can participate in research studies and fund those studies and you get better data. Because I'm not privy to those data. I can't answer the question of where they came from, where they are in the United States. Those patients and doctors have to release that information, and that's not the job of the diagnostic company. So the information is not usable in that way. We're pretty good right now. We've been as responsive as can be. By the way, if anybody thinks they might have been in our repository, if you simply e-mail me, we did decode that study over the Christmas holidays, so we can tell you if you're positive or not. We can tell you whether or not you were in the study. Because there's more than 500 samples, who are patients in the repository, and we only pulled about a hundred of those for this study. I don't remember everybody, but we did decode it, so we know who the positives are at this point, and we are sending letters, but you have to ask me first for our human-assurance protocol, so just ask me and we'll tell you.

Question: In the beginning, you mentioned that the virus uses lipids to grow?

Dr. Mikovits: It actually uses the cell lipids to make its lipid membrane. It's an envelope virus, and it has lipids, so it pulls cholesterol in to make its (inaudible), so it uses all the cell machinery. It only codes the enzymes and the envelope proteins and cells, so the lipid bilayer of the envelope virus, there's lipids in it. It's from your cells, and cholesterol's a part of that.

Question: Because I'm wondering, I've met a lot of other CFS patients who like me have high cholesterol. That just made me think: might there be a correlation?

Dr. Mikovits: Yeah, and nobody's ever looked. It's certainly something that they could look at correlating. I can't think of a reason why. You might presume you'd have less, if you're using it up for another purpose.

Question: What about children?

Dr. Mikovits: We do have a little bit of data on that because we have two children in a study who have a genetic disease of cholesterol. It's called Niemann-Pick's Disease. It's also known as Childhood Alzheimer's. And these kids, you know it's a cholesterol metabolism disease where eventually your brain, you'll eventually die of it because if you get too much cholesterol, it messes up your brain and everything. And those kids have been treated by James Hildreth in Nashville, Tennessee, at a small college… He's using Cyclodextran and some of the cholesterol drugs. He's actually an HIV drug developer, and the kids are showing some improvement when he modulates that pathway and stops the virus from entering or exiting the cell, so we don't know anything about XMRV. We just know what other viruses do, so he is having success, suggesting that there are some opportunities there.

Question: Are you working with him?

Dr. Mikovits: Yeah, we're working with him as well. That's why I didn't list all the collaborators in the United States. We're providing reagents and whatever

intellectual knowledge we have, and whatever physical abilities and instruments we have, to these collaborative efforts as well.

Question: Until forthcoming therapies are established for those who have XMRV, what are people doing once they are tested? Are they taking immuno-modulating therapies or whatever?

Dr. Mikovits: Some of what I showed you here, that turn on/off switch, suggests non-steroidal anti-inflammatories. So non-steroidal anti-inflammatories could help. Things that will balance cortisol. Maybe – these are just thought processes – because you know inflammation turns on the virus, and I don't know much about hormone therapies and how lowering hormone levels might help. But I do know anecdotally that a lot of women in a particular time in their cycle get much, much sicker and can't get over it. I do know in the laboratory progesterone really up-regulates the virus, so if you have a birth control pill – and again I don't really know anything about this (I'm not a physician) – you might think about just keeping the levels balanced and avoiding the fluctuation.

So certainly supplements can help a lot. Retroviruses cause a lot of oxidative stress. So things like N-acetyl-cysteine and glutathione, the detox type. People do take supplements. I know that a lot of people have had success with immune modulators, just helping their disease, or supplements, because they know about them. I caution against taking too much or taking a bunch of things. Try to learn as much as you can, because supplements aren't controlled by regulatory agencies, and therefore, if you're not using a high quality, you could actually be putting poisons in you. Since we don't know much about the virus, you could modulate the wrong way. But things that up-regulate Natural Killer (NK) cell function (and there are known compounds out there that do that, that are marketed in our state), so that could help you. So, we don't know a lot about it, but that's how people are actually starting to help themselves.

The other thing is to stay out of stressful situations. It's hard to do. In fact, we've seen a lot of people get worse just with the stress of the discovery, which is sad. That's why I want you to call me. Because we don't want you to think: "Oh no, I have a retrovirus!" We want to talk to you because it's serious and you can have untold (inaudible). I mean most people say: "Wow I got it!" you know they're congratulating people when they come up positive, which is really strange… [laughter] Then they get really scared, because they don't know anything about it. And we're here as much as we can to help, but we don't know anything about that retrovirus. All we can say is the same thing I've been saying today. I hope you would walk home and say: "It's not a mouse retrovirus. Retroviruses are not ubiquitous, and they're not benign. So I have to think about those facts." It's wide open.

The drug companies – the one thing, if you do get tested, and we know you're positive, a confirmed positive – we'll get you into the earliest clinical trials. And they'll have things pretty soon because it's major Pharma, and I've given them the reagents and the cell lines – we've made several cell lines from people that make a lot of virus. And so we've given them those cell lines. All they have to do is take something off the shelf that rationally might inhibit a particular path, say the integrase gene or another gene that's conserved across the three retroviruses [HIV, HTLV, XMRV] and show that they can see the efficiency, efficacy and knock down levels of the virus in the lab to levels, which they're the known blood levels of the drug can achieve, and they can submit and do the paperwork for a clinical trial. And it's already known to be safe because it's already passed Phase 1, or safety trials, in humans. So we looked at those first. And there are a number of companies who, as I say, they are high quality companies, and they are more than interested. They are doing it now, and have been doing it since October.

Question: What about cancer, especially the hormone-responsive cancers?

Dr. Mikovits: We very much expect that some of the breast cancer incidence – we hypothesize that inflammatory breast cancer is a lot like what we saw with the inflammatory prostate. But yes, it is a very real hypothesis because the incidence of breast cancer in young women that you never used to see before, is rising at levels that suggest something environmental, and not necessarily genetic. You know, "we never had cancer in my family," and you see young women that way, so it certainly is something that we're looking at. The "we" here – I always say "we," and it's everybody but me usually – it's the National Cancer Institute. We're also looking at lymphoma, because CLL (chronic lymphocytic lymphoma) is a lymphoma, a B-cell lymphoma and it's also been going up and up, and it suggests to us some kind of role of an infectious nature. So we are looking at a number of lymphomas with a group in New York, a group in Florida, and the Nevada Cancer Institute. I don't have a breast cancer study set up.

Question: There's actually an anti-retroviral vaccine that's been used…

Dr. Mikovits: Yeah, a vaccine is a real opportunity, and we know that they still don't have an HIV vaccine yet that's efficacious, but HIV is a complex retrovirus. So when you're thinking about the reason why you have to take a flu vaccine every year, it's because the virus changes. Well, an HIV virus in a person in a week will change too much. They call them quasi-species. One of the really interesting things about this study is that we only isolate one thing out of these people. When we do the sequencing, it's clean. We don't isolate quasi-species. We don't have the virus have these changes here in one week or one year – we have patient samples across dozens of years. We isolated XMRV from a 1984 plasma sample from a patient. We got it in 2008 and we got it in 1984, which again suggests that the virus has been around at least 25 years, and it might have a role in the disease but is not causative. So yes indeed, it could play a role in other things.

Question: People with CFS have shown a lot of evidence in other studies of being immune-suppressed. How are you certain that it's XMRV that's causing immune-suppression as opposed to say 8 other viruses like Kerr is suggesting, or other viruses that are causing immune suppression and making XMRV opportunistic?

Dr. Mikovits: Well, there are a couple of things for that. First of all, we're not certain of anything. So I'd say it's a hypothesis. It's because of what I know about HIV, and HHV-8, herpes viruses, where it's the underlying immune deficiency. The other viruses aren't retroviruses, the other pathogens too, the bacteria, and they don't live in your immune systems forever and replicate and have reservoirs. They're across the board, so everybody's infected. Probably 90% of this room has an EBV infection. But very few people express EBV, have chronic active EBV. That suggests that your immune system has something wrong with it. It could certainly go either way, but retroviruses don't do that.

The CFS world has looked at many of those pathogens, so here's chronic Lyme and here's EBV and here's… It's never one place, something that unifies all of those. So it's certainly a testable hypothesis, and that's one of those things that will just happen. If you get an anti-retroviral and the chronic EBV goes away, and a lot of the symptoms go away… I'm not saying that the EBV doesn't cause a lot of those symptoms. That's what makes it so hard to figure out the disease. But if there's an underlying immune deficiency that's created… that's not simply depression… but is getting worse every year, could be an explanation. So we're happy that we can test that, because we do have different populations where we can see what the role of the co-infection is. We've never looked. We're looking with various groups at big cohorts of chronic Lyme and big cohorts of chronic EBV, Q Fever – things like that have been associated with. Jonathan Kerr, in fact, he's working actively with us to see if it makes sense, that you need the combination or you need one or the other. But, in the general population, the incidence of XMRV is something between 2% and 4% right now, whereas it's 90% of some of the herpes viruses. And most

But, in the general population, the incidence of XMRV is something between 2% and 4% right now, whereas it's 90% of some of the herpes viruses. And most of us are exposed to some of these other pathogens, so I certainly don't have an answer, but again, this gives us a testable hypothesis to look.

Question: I'm XMRV positive. And I have a son who is. I was told that he also had Lyme when he was 7. Explain the chronic Lyme connection in him?

Dr. Mikovits: Well, again, we don't know – it's our hypothesis that, especially in Lyme disease, where it goes away and it's almost cured and you only see some proteins that don't necessarily; you know; it suggests you almost cure it with the antibiotics, but you have to keep the antibiotic there because there is a low level that your immune system can't clear, and maybe it can't clear it because you've created an immune deficiency with the retroviral infection. We've never looked at a Lyme cohort yet. Again, we're setting that up, but we don't know the connection. The hypothesis is, if we can treat the retrovirus, then the chronic Lyme will go away. And you'll treat both.

Question: But he was untreated until about 7, and was bitten in Europe, and no-one understood that there. He had the rash on his legs, and no one believed me that that's what it was

Dr. Mikovits: Well, we can still clear the Lyme. For instance, in the AIDS population, you treated the pneumocystis pneumonia. You treat it with the appropriate antibiotics because you don't want the co-infections to kill him, and then do the anti-retrovirals too. There's no reason, for instance, one of the questions that I got online was, "Well, I'm taking antivirals. Do I need to stop in order to get tested?" No, because antivirals don't target retroviruses. Retroviruses are very distinct viruses, so no you don't need to stop. We'll still find the virus.

Question: But even 10 years later, because he was never treated. That was 10 years ago. You're still saying you would still treat for Lyme?

Dr. Mikovits: Yeah, well you probably should be at this point. Treated for both the Lyme and once we have a treatment, for the retrovirus.

Question: If XMRV is transmitted sexually, how come it's not seen as CFS in couples?

Dr. Mikovits: The possibility is that it's transmitted sexually, but we've never actually shown human-to-human transmission, meaning we caught the day when the other got sick. I don't actually have an answer for that, other than that I know that it might well be more in couples than we think, because it's a milder form of symptoms, or maybe this person's a carrier. There's still a lot we don't know about why prostate cancer and why CFS… What is the hormone component that turns on the virus? They may be carriers and not know it, and certainly there's a lot to study there, to understand the gender differences in these diseases.

Annette Whittemore: Maybe part of the answer is that, if XMRV turns out to be the cause, would you have said that you wouldn't have CFS without it, given you can have the virus without having CFS?

Dr. Mikovits: We have looked in a limited number of families that we've done, and in fact, maybe only one member of the family has CFS, and so it will be an interesting year, but, once we really get to the data of looking at these families and the various diseases and trying to understand – it's a very low replicating virus, so it really just sits there for a long time. If you can keep the reservoirs low, you might have the virus your whole life and never get sick. We don't know how long it's been in the population. We think, like with other retroviruses, the younger you get sick, the more severe the disease. When Sandy Ruscetti gives the rats the viruses when they're neonates, they get cancers. When they get it when they're 30 or 40, they don't get anything.

The immune system is educated and grows as you go along. It can be more fragile at different times in your life. We've seen a lot of puberty, boys and girls alike. There's a lot of infection or at least apparent infection, disease occurrence at 12 or 13. And I do know that's when Andrea got sick [to Annette Whittemore]. And yet presumably, your family was in the same space, but there was no child who had hit puberty at that point, and that might have been the difference. Retroviruses don't infect people differently. You can't go to Germany and say the reason they don't find it is because they have hardier genes in Germany (although my husband might argue that) [laughter]. Because everybody gets infected. It's just which immune system can control the virus and keep it down. Since we've been able to treat HIV/AIDS now – we found elite controllers, people who are walking around with HIV who never knew they had HIV, and the copy numbers are all low. Their immune system is fine, and they have no idea when they got it.

Question: A lot of patients say they had a flu, a weird flu-like condition, a week or two before they got CFS. What you're saying is that flu-like illness is a bug that came along and allowed the XMRV to create CFS?

Dr. Mikovits: Well, no. I know almost nothing about CFS, but what we think is happening is – remember the slide where I showed you with those little events? You know, what was the event that was the straw that broke the camel's back? Where did the balance tip between here you've got your immune system working well and the virus and the immune system are co-existing just fine, then some other, that other bug, whether it be Lyme, a flu, anything, gets you. Then the virus, the cells divide, and so do the B and T cells you need to mount an immune response. And now you've got your memory population that might have been harboring the virus, and it's replicating because it's seen that same pathogen before, so it could be a common everyday pathogen, and then you just tip the scale to where now your immune system can't handle it. And every day you're seeing more infection because your NK cells aren't working, your B cells aren't working.

We put that antibody up there for a reason. We haven't been able to correlate the levels yet, because we haven't been able to find high enough numbers. But we do see these infected families where infected spouses have very high levels of antibodies, that suggest maybe antibodies in this retrovirus can be protective, and maybe there's an immune therapy on the horizon as well. So you can think about it in that way. It doesn't have to be the insult. You might not know how long you harbored that virus.

Question: So what you're saying is XMRV was there, it wasn't the insult, then something else came along that was the tipping point?

Dr. Mikovits: Yes, that was the tipping point, that's correct. That's our hypothesis. And again, it's testable, we don't know.

Question: You've got a big population of patients with sudden onset and then you've got a big population that had gradual onset. And a lot of the gradual onset patients are worried that "Maybe I don't fit this equation." What would you say to that?

Dr. Mikovits: That little bump is smaller, so it's not a huge burst. That it was little insults over time. I think, for me anyway, I know only a handful that I've looked at, that I know the patients, and I know what the onset was. But the gradual onset – there's no real difference. It just depends on that environment, what the other triggers and events were that spurred it on. So, I don't see, if you are gradual onset, it doesn't mean that you might not be infected as well.
Questioner: That's an important thing to know.

Question: Have you tracked any of the inflammatory markers in the blood with the XMRV virus?

Dr. Mikovits: Yes.

Question: What are you finding?

Dr. Mikovits: We find a signature suggesting a viral infection, an unclear viral infection. We have 5-10 inflammatory cytokines and chemokines that will cluster in an infected person. The problem is we don't know if it indicates active infection. Certainly, when the virus is quiet, that inflammation will go down, and those cytokines will change. And it might be a nice biomarker for following active infection, but we haven't analyzed the data in that way yet. It very well could sit, and some of those go down and up very quickly. So, like in 3 days, your IL-8 and your IL-6 and some of the chemokines are elevated and then they go back, like an EEG. Just like you might assume the retrovirus could be an EEG, depending on where in the body that is. We don't know the reservoirs, so we don't know what's controlling it.

Question: I'm confused about something. You say you can't find it very easily by PCR, so you are culturing it. Then how did you find it for the Science paper?

Dr. Mikovits: Well, because I found it in 67%, by PCR, of the patients, but I looked at samples collected at several times. I just said it's like an EEG. So I got lucky and I found it at a time when the patient was high. They'll come to the doctor when they're sick, which might mean they're replicating more white blood cells, and there's more virus in their white blood cells.

Question: So you took like 10 samples from one patient?

Dr. Mikovits: Not that many, usually it was 4. The copy number could be as low as 5 or 10 copies per mil of blood, so there's a statistic called a Poisson distribution, where you might find it one out of three times, so we went more than one of that and went 4 on most people when we found it.

Question: So the UK paper had studied patients, if they had looked at 4 or 5 per patient, do you think they might have found it?

Dr. Mikovits: They might have certainly found more, yeah.

Question: They essentially accused you of contamination.

Dr. Mikovits: Right. But why would I have contamination in my sick people and not my healthy people? How would I do that? I did it in three different labs. I did it in Cleveland Clinic. When I first came to the Institute, we didn't have a lab. So everything we drew from around the world, I sent to Frank's office. They processed it. I went there, I put it in the microarray or did whatever I was going to do, and we worked there for a couple of weeks, you know, while we were building our lab and it got started.

From the way we did the study, there's just NO possible way there was contamination. And that's what the reviewers concluded. And the phylogenetic analysis was one of the things they asked for (they asked for 3 things after the initial submission). The phylogenetic analysis proved two things. It wasn't a mouse virus, it's a human virus; it wasn't a contaminant from a lab. We never do mouse work, but it wasn't a contaminant from mouse feces or something in the lab, and it clearly was a new branch in the [phylogenetic] tree, a human virus. And our virus wasn't exactly the same as the prostate cancer virus. It's still XMRV, because it's 99% similar. But that's enough to show it's not a contaminant. One of the things you have to use to get a good PCR is at least 750 nanograms of DNA. They have no idea how much DNA was there. And they quantitated 3-9 out of 186? Sure they found a band of globins, but globins are in every single cell, so again you're making an unfair comparison of what you're saying you see. And then you amplify it for fewer cycles than what would really push the envelope.

We've also done – to show no mouse contamination with the CDC, and Bill Switzer – after he saw the results in the paper before it became published. He said, "I have an assay that'll show it's a mouse contamination. It's a very sensitive, very specific PCR. Will you do it?" I said, "Sure, send it to me." We did it on all 100 and not a one. Not one cell line in our lab. He's found it in a couple in his lab, but we didn't find any. Perfectly controlled. He said, "Congratulations, it's not a mouse contaminant." So there's little else we can do, except wait for the rest of the community. It's there. And the prostate cancer people didn't say: "oh you didn't find it in 500 people; it must not have anything to do with prostate cancer." Because it just didn't have anything to do with that population.

And again, Norbert Bannert is a high-quality scientist. As soon as he saw the paper, he called me and asked for the reagents. Because he's gonna go back and look to see if it really is there, and help us find some answers. He's also looking at a CFS group. So it just depends on what you really want to find. We weren't biased in our study. You know, I'm a cancer cell biologist, and we aren't biased. I had to work really hard to get most of the people – not Frank and company – the National Cancer Institute (NCI) didn't know what CFS was. You know, fortunately, our scientists can to some level do what they want, as long as it's along with the mission. I remember one gentleman, high level NCI official, said "tell 'em to get over it." Again that's the credit to Annette and the formation of the WPI – we got a grant where we literally named XMRV within my first six months in 2007, because of the juxtaposition of seeing that paper in prostate cancer, right when we met.

And thinking about the possible mechanisms, and the grant got rejected three times, you know, because scientifically, retroviruses aren't in CFS. If you went to Wikipedia in August, it said retroviruses aren't in CFS. It doesn't say that anymore. So we made progress. [Audience: Wow!]

So, will there be a variant? Maybe England is the variant. Maybe there's XMRV2, and one causes more. Maybe we found the one that causes the least severe disease, and maybe there's XMRV2. A group emailed me from China, and the guy said "please," you know in very broken English, "please don't leave me, please write me back. Please help me." And so Sam Chow was going over there, and I said will you look up this group? And Sam Chow has found a virus that looks like it might not necessarily be the same virus, might be a lot more aggressive virus over there in disease, but that's just anecdotal.

So, we don't know. The good news is we have something to work with that is a very testable hypothesis. This has been very rigorous. You don't get more rigorous than Science, and certainly not Frank and Sandy Ruscetti. They're highly regarded. That entire team contains world experts. So, the CFS population had the opportunity to have them look at us, and they are good enough scientists that they didn't show any bias. They looked, you know – I asked Frank to come out to Reno before I took the job, because I said, I hear a lot of things about this. So he came out and stayed a few days and talked to some patients and spent some time with them. And I was on an East Coast trip working with my drug company. I came back a few days later, and I said, "Well, what do I do?" And he said, "Take the damn job!"

So, if you're really looking unbiased, and you look at this, it could be only 10 million people in America, it could be only endemic right here, it could be like Japan. And HTLV is pretty-well innocuous. 5% of people get ATL and 20% get that tropical spastic paraparesis or HTLV-1-associated myelopathy. I was glad when they changed that thing, by the way, because I can't say that and I couldn't spell it either! Those patients, they actually go on steroids to dampen the inflammation, the immune response, and they are fine for decades. But you know, in the Caribbean and in Japan, it was a health problem, so maybe we only have a health problem and the distribution is not – but we do have at least 10 million Americans, and maybe a majority of the CFS population here in America, that we have a lot of work, just to treat, and that will be the focus of the Institute in the coming years. Certainly, we will treat everybody else, but

obviously we don't see anyone else. Dan was funny, he was like "Well, Judy, I have to take care of everybody else" and I said "of course, there's not anybody else!" So it's an interesting and an exciting time for sure.

Question: I just wanted to say, you know, it is really exciting to hear you say we need to do this, we're gonna do this. The virus you are studying, it's our virus, and I think it is really important to note everyone that for you to do what you're talking about, and for other researches to do it, we patients need to get behind funding the research in a way we've never done before, or it is not going to happen.

Dr. Mikovits: But have your government fund the research. HIV incidence in this country is about 800,000 people, I just quoted 10 million….. I shouldn't say this, but when I saw it was a prostate cancer virus, I said "man, those men can't possibly ignore this now!" [laughter]. I never said that publicly.

Question: Would you talk about what is coming up in the next years, what are the next steps, where are possibilities with your treatments, with the replication studies?

Dr. Mikovits: Yeah, all of those people I showed you internationally are working to replicate the study as is the Blood Working Group. We have been intensely working with them. We have another conference call on Monday, these things are happening. We will put probably 20% effort in our lab into that study. We are very serious about transmission studies in our lab and in the Institute, and we have one starting where we're simply comparing infected people, people who we isolated from the blood, and just taking DNA in their saliva, for example, to see if there is any evidence in saliva or of that kind of transmission just again. That is just because of anecdotal stories, where people say, well, you know a bunch of kids on the playground with a water fountain, or at school. I don't know what the anecdotes are, but just thinking about ruling those kinds of things out is a study we are doing.

We are also actively looking at the incidence in other neuro-immune diseases, so we are looking at that study I told you about. We are looking at cancer and CFS, we are looking at Fibromyalgia, Atypical MS. We've got a study going with Vanderbilt in POTS, which is Postural Tachycardia, because of the overlapping symptoms. He is simply just sending me a bunch of samples, both sera and DNA, and we are just going to take a look to see if we see it there. Autism – we do have families with some autism, and there are some immune defects characterized by Judy Van de Water at the Mind Institute in Sacramento, and she sees some NK cell dysfunction, some inflammation, some of the things I told you about there. So, in that group of autism, we are looking to see if maybe there is not an underlying pathogen or XMRV infection. Those are just the priorities, just in the coming year.

The NCI, the National Cancer Institute, has already put $1 million into the development of the reagents and the assays, so very soon the best of tests and all the reagents can be distributed. So, the AIDS reference program (there is an AIDS Reagent Reference Program that if you just google that you will find them) has agreed to set up for XMRV and send reagents around the world. We're spending considerable time and resources just shipping…We are continuing the studies of the immune system, so I had an entire program set up from the beginning where we are looking at the genetics with Mary Carrington. We are looking at the type 1, so Vinny Lombardi will continue his studies. Just because that single nucleotide variant, we didn't find having any correlation with XMRV infection, doesn't mean there's still not something wrong with RNase-L, and that might be a therapeutic target. So Vinny is actively studying research, the type 1 interferon pathway and RNase-L.

Isabel Barao-Silvestre is a faculty member that's just joined us, she is a professor, and she is at UNR as well, and she is an expert in Natural Killer cells and killer cell function, so she is doing a lot of the innate immune response and understanding how XMRV infection in NK cells might contribute to disease. As I hypothesize, we don't know how yet, so those are the internal programs going on. Because of my background I'm actively perusing all the drug development efforts in our laboratory by working with at least three companies right now, to look at that.

Those of you in the audience and around the world, if you email a question, we try to answer every one of them (info@wpinstitute.org). One that came up which I think is good to address is, a lot of people wanted to know if XMRV somehow "piggybacked" on EBV or other pathogens to get into an affected individual, and I didn't know what that term meant. It's not a scientific term. But if it meant that you couldn't get XMRV unless you had come in with another infection, there is just no evidence of that in any retrovirus. So, yes, people think that people got infected with HHV-8 and HIV at the same time because of the Africa thing. You can get infected with 2 pathogens at once, but there is no need for any to piggyback. You don't need another pathogen in order to be infected with XMRV or any other retrovirus.

And any other question, if you have written them down, I am happy to answer them. Some people are like "I emailed you yesterday and you didn't answer" and I say "oh, I slept yesterday." If I don't answer you within a week, then write me back because sometimes I miss it, and sometimes our emails are so full these days, that they are throwing things into spam. So, if you haven't heard from me, you will usually hear from me within a week because I really do try and answer essentially every one that I get, which is probably foolish, but I like to actually, I like to work with the patients.

ProHealth Organizer: That was wonderful, thank you.

2010 (April) Interview

Volume 3, Issue 1 • April 2010

Questions and Answer Session with: Dr. Judy Mikovits: Principal Investigator, Whittemore-Peterson Institute.

- [Andrew Bokelman] Q: From what I read, XMRV is infecting immune cells. If patients take nutriceuticals that have been shown to increase natural killer cell count, could some of this increase in NK cells come from dividing infected cells, thus risking a heavier load of XMRV?
- A: Because XMRV research is in its infancy, little is known about the tissue reservoirs of the virus, while many cell types can be infected (because the XPR1 entry molecule/receptor is on every cell in the body), few cells support high levels of replication of XMRV. You could potentially increase the viral load by increasing the NK cell count. However, we have done studies with compounds that increase NK cell Killing without increasing NK replication or XMRV viral loads so NK cells kill better and can therefore be efficacious in killing XMRV infected cell.
- An extremely minor species of HIV becomes a dominant species when a large mixture of the viruses (quasi-species) from the blood of AIDS patients is

cultured in the laboratory. As much as 18% of our human genome (3 billion genetic codes) are made of retrovirus sequences. The sequence of XMRV is 95% homologous to the human endogenous retrovirus (HERV) sequence in our human genome. Is the 5% genetic sequence variation enough to call XMRV a new virus? Is XMRV a minor quasispecies that is selected out and predominantly amplified from the tissue cultures?

- The 6 full length XMRV clones: 3 from prostate cancer tissue biopsies from men in Cleveland and 3 from leukocytes from female CFS patients in the Western United States drawn in 2006-2008..were 99% similar. We did not despite repeated attempts isolate ANY other variants from those individuals suggesting that the virus is very low replicating and unlike HIV does not have quasi species. As much at 18% of the human genome is retroviral elements or endogenous retroviruses. THESE ARE QUITE DISTINCT FROM EXOGENOUS VIRUSES! PRIOR TO THE SCIENCE PAPER THERE were ONLY 2 EXOGENOUS human retrovirus families, HTLV (1,2) and HIV (1,2). HERVS are not infectious exogenous retroviruses...The main point of the science paper was the demonstration that XMRV was the third human exogenous retrovirus and that it was blood borne and transmissable (can isolate it and do primary and secondary infections of primary human cells) Moreover, the full sequence of XMRV was blasted against the entire human and mouse genome and NEITHER the mouse genome or the HUMAN genome contained XMRV..proving it was NOT a mouse virus. XMRV was on the basis of our data proven to be a NEW HUMAN Blood borne infectious and transmissable retrovirus. Finally the proof of an immune response in CFS patients from whom the virus had been isolated and sequenced showed that the XMRV in CFS patient was not a mouse contaminant or a human lab contaminant.
- [John K. Chia M.D.] Q: It has been said in the new paper article that XMRV is transmitted by blood, sex and body fluid. The author may have meant that this is what happens in mice but is not yet defined for human. Sexual transmission (men who have sex with men) and transmission through blood (hemophiliacs) were long suspected based on epidemiologic data before HIV was found to be cause of AIDS in 1984. ME/CFS does not have typical pattern of sexual transmission although there are rare mentions of transmission between couples. Most of my patients have developed ME/CFS after flu-like illness with respiratory and/or gastrointestinal symptoms, which would speak against sexual and blood transmission. Furthermore, why are children developing this illness and why clusters of cases occurred in Incline village and other areas, if the transmission is as stated. Please clarify this issue.Thank you,
- A: Newspapers are notorious for extrapolating data and drawing conclusions. We and Dr. Stuart Legrice attempted several times in writing to correct the mis-statements in the Wall Street journal and the NY Times. The Science paper showed that XMRV was blood borne, infectious and transmissable SUGGESTING blood and body fluid transmission although NO studies have proven transmission of any kind. The authors meant this is the mode of transmission for the other two human exogenous retroviruses HTLV-1 and HIV. XMRV is NOT a Mouse virus and NO ONE knows how it got into the human population). This author has never worked with mice.
- It is important NOT to think only of HIV when considering modes of transmission. Body fluid means ANY body fluid, blood was proven in the Science paper, but one can also consider saliva, vomit, urine and feces. XMRV is a gammaretrovirus (simple) and these tend to be much more stable than HIV and HTLV1 which are complex retroviruses. XMRV has been demonstrated by us in the science paper to be very stable and easily transmissable CELL Free unlike its cousins HTLV (which is tightly cell associated) and HIV, which is very labile and not stable in vomit feces or urine and while it can be shed and theoretically transmitted in saliva this is rare as it is labile cell free as well.. the flu like illness and gastrointestinal issues are consistent with stability in other body fluids and particularly in acidic environments such as the gut and urine...We have isolated infectious XMRV from saliva and prostatic secretions to date and tested its stability. These are unpublished data and we await the development of a quantitative viral load assay, but when we can quantify the stability, my hypothesis is that XMRV is the most stable human retrovirus to date and while no human retrovirus (or animal retrovirus is transmitted airborne) our hypothesis is that we will find the transmission is in other body fluids and outbreaks occur because of the stability of XMRV in other body fluids
- [Pat Turello] Q: Do you think that any of the new biotech drugs for MS could be useful for CFIDS? Thank you.
- A: My (limited knowledge of the new MS drug is that they target the hyperactive immune response and trafficking of white blood cells from lymph nodes so if a reservoir of XMRV is the lymph nodes and the hyperactive immune response (as we suspect) plays a role in disease progression through increased replication of XMRV or trafficking of white blood cells harboring XMRV to sites of inflammation, then these drugs could be useful for XMRV associated CFIDS. Are there any official (or unofficial) records of forested areas near and around Incline Village being sprayed for 'insect control' prior to the outbreak of CFS there ?There is no data or records that I am aware of and no evidence that XMRV is spread through insects (in fact there is no evidence of how XMRV got into the human population)
- Q: Is it possible that XMRV is (or related to) an 'escaped,' genetically- engineered laboratory research retrovirus?
- A: NO laboratory researchers are not smart enough to engineer new human retroviruses. XMRV has never been detected in ANY other animal in nature except humans.
- [Nancy Allen] Q: Please explain the significance of "xenotropic" in the transmission or infectivity of XMRV ?
- A: Xenotropic viruses are not able to infect cells derived from laboratory mice (or the mice themselves but they can infect cell lines from a number of other species including humans and wild field mice...more proof that this is not a lab engineered or escape variant.
- [Nancy Klimas] Q: Hey guys! miss you! I am keeping things hopping here in Miami, but it isweird being off the board. I noticed VIP Dx has dropped the PCR part of the XMRV testing, in favor of culture. Why?
- A: PCR of genomic DNA was found by the WPI and its NCI collaborators to be the least sensitive method of detecting XMRV because of the low copy number of XMRV and the realization by the negative studies that only 1 in 1miiolon resting white blood cells harbors a copy of the XMRV provirus. Thus VIPDx was getting too many false negatives..ie the failure to detect XMRV. The same reason that other companies using sensitive PCR failed to detect XMRV from a spot of blood or 1 ml of blood. Retroviruses multiply only in dividing cells so VIPDx dropped the first PCR in favor of biological amplification of XMRV before PCR detection. Not only are the results more reliable but the test is considerably cheaper. The most important thing is to get the CORRECT answer!
- Q: Do you feel that XMRV is necessary and sufficient or necessary but not sufficient or not necessary or sufficient to cause chronic illnesses like CFS?
- A: Our hypothesis is that chronic XMRV infection creates results in an immune deficiency that is necessary but not necessarily sufficient to result in chronic illnesses like CFS. As with HIV/AIDS copathogens define AIDS, CMV retinitis, kaposi's sarcoma are AIDS defining co-pathogens. That said XMRV is a type C retrovirus and Type C retroviruses are associated with neurovirulence in a range of host species, including humans, cats, rodents and birds with or without concurrent immunological disease suggesting XMRV can be Necessary and sufficient to cause CFS.
- Q: What are your current % positives in CFS? In controls?
- A: In CFS disease satisfying the Canadian consensus criteria, we have isolated virus from more than 300 patients of~400 tested but we have serological evidence in another ~10% of CFS patients fulfilling CCC criteria, from whom we have not isolated virus, clear evidence of infection but the significance of which is not known.

- Q: Is there an indication that the virus is active and being transcribed in CFS? What percentage of positives are being transcribed?
- A: The Science paper clearly showed active transcription of XMRV in >75% of the pateitns tested and similar suggestion of latent infection or evidence of infection without isolation of virus in 10-15%.
- Q; With the known % of CFS patients positive for Mycoplasma species (~60% in multiple studies), Chlamydia pneumoniae (~10% in multiple studies), HHV-6 (~30% in some studies) and other infections, is there any concordance with XMRV positivity?
- A: We have only done those analyses on the 101 in the original study, HHV6A was 10%, EBV ~14% and nothing else more than 10%. We are working with several groups at Lyme and those numbers may approach 30%-40 of those tested.
- Q: Do you feel that XMRV could act to cause dysfunction of the immune system, allowing opportunistic infections (such as in 4, above), similar to HIV-1 in AIDS?
- A: Absolutely that is our working hypothesisQ: Do you think that treatment of XMRV might be useful or possibly too late in CFS to restore patients to pre-infection health status?
- A; I am extremely optimistic that treatment of XMRV or its immune target(s) will restore CFS patients to at least 85% of the original health status even in the sickest of the sick. I base this optimism solely on the level of health that was achieved in HIV AIDS patients with the advent of highly active antiretroviral therapy (HAART) and XMRV is much less cytopathic than HIV, its effects on the immune system are more subtle. I think the evidence is that some recover with out ever treating the XMRV or maintain relative health for years between “crashes”.
- Q: When you assess signs/symptoms of patients with positive XMRV, are there any that track or don't track well with XMRV positivity compared to CFS patients as a group?
- A; I am not a clinician and right now we don’t have sensitive quantitative assays to monitor viral load so we have not actually tracked symptom severity and XMRV positivity. For Science paper we did correlation analyses on every clinical marker of immune status, that we had available to us including RNAase L, NK (number and function, co-infections, cytokines and chemokines and NOTING significantly correlated with a CFS diagnosis (the referees and editors felt these data were not important for the paper as they were all negative data. The only one they published was the R462Q RNaseL variant as this was the original hypothesis under which XMRV was discovered. The ONLY immune marker which correlated with XMRV infection 100% was decreased Interferon alpha.
- Q: In families with more than one CFS (or other chronic illness), is there any indication that XMRV was transmitted to immediate family members? Prof. Garth NicolsonThe Institute for Molecular Medicine
- A: YES...lots of them and I have not looked at everyone but my knowledge of the 101 in the Science paper is that more than 2/3 of them have family member who are infected and MOST are ill perhaps with another overlapping chronic illness..for instance FM and CFS or CFS mom and autistic kids and the cancer in some of the families is frightening.
- Q: I read where 75 top researches met on 16 Dec. 2009 to discuss the current research findings about XMRV. I have been looking, but unable to find any information about what they had found. Hope you will include this.William HaysA:I am not aware of that meeting nor am I aware that on December 16th of 2009 there were 75 top researchers working on XMRV! On November 10 the Cleveland Clinic sponsored a meeting where ~15 scientists presented their data including the WPI) on XMRV in cancer and CFS. There were 75 people in attendance and it was an interesting meeting but honestly I would be surprised is there are yet 75 top researchers in the world working on XMRV.Q: How do you see HHV-6 and XMRV interacting?
- A: There are no data to suggest that HHV6 and XMRV directly interact in any way. XMRV is a simple retrovirus so it encodes only structural proteins and not transacting factors like HIV and HTLV. We are testing the hypothesis that like HIV, the transmission of XMRV and the progression of XMRV disease are accompanied by de novo infection by other microbes or by activation of microbes that were present in the host in homeostatic equilibrium before XMRV infection. In recent years, data have accumulated on the interactions of these coinfecting microbes—viruses in particular—with HIV. Coinfecting viruses generate negative and positive signals that suppress or upregulate HIV-1, suggesting that the signals generated by these viruses may largely affect XMRV transmission and pathogenesis as they do with HIV transmission and pathogenesis.
- Q: The Brits have commented that both M.E., and the U.S. cluster outbreaks of the 1980s, seem to spread like an enterovirus (a polio-like virus), not like a herpes virus.
- A: XMRV is a retrovirus not a herpesvirus so I don’t understand the comment. HIV causes leaky gut and disruption of the gut microbiome and an open blood brain barrier allowing pathogens access to areas of the body that these pathogens normally would not have access...the same could happen with XMRV...I guess I cannot answer this because more than 75 of the 101 patients in our study were not involved in cluster outbreaks.Whether that criticism holds, it certainly seems the outbreaks did not follow the pattern set by HIV. While our knowledge of HIV disease is useful in developing hypotheses and studying potential mechanisms of HIV pathogenesis, XMRV is totally unlike HIV and HTLV-1 in that it is a simple retrovirus the first ever identified human exogenous simple retrovirus and the family of viruses most closely related to XMRV causes neurological diseases and cancer very by mechanisms distinct in many aspects from HIV and HTLV. We discussed earlier XMRV may be much more stable in body fluids other than blood and cell free and would completely explain clusters and sporadic transmission as seen in CFS both in the US and UK
- Q: How would teachers in the same school, for example (who were not misbehaving), contract the disease from each other?
- A: See above but what if XMRV is more stable in body fluids such as saliva, urine, vomit such that exchange of body fluids less directly than sexual contact and blood borne direct infection were the mode of transmission.This hypotheses would satisfy the familial and close contact such as a school particularly if a co-pathogen enhanced transmission and progression as was the case of HIV and HSV in Africa.
- Q: What does this mean for young women who wish to become pregnant, but who might have XMRV?
- A: Gammaretroviruses can be transmitted vertically and are transmitted in breast milk. The hormone responsiveness of the virus suggests that lactating moms express more XMRV in breast milk. HTLV 1 was endemic in Japan so simply preventing breast feeding reduced HTLV-1 associated neuroimmune disease and cancer by 40% on one generation. Vertical transmission is more difficult but even if infected, the key is to keep the reservoirs of virus low..Stop the XMRV from being expressed and spread to healthy cells keep the XMRV provirus from integrating into long lived cells ....the variation was so small and the lack of quasi species and high levels of replication suggest that vaccine development will be easier with this retrovirus that with the complex retroviruses, HIV and HTLV. The most important thing to do is identify everyone infected and stop the spread and replication of the virus in every individual prevent disease in those who are well and stop the progression and restore the immune system in those who are ill.
- Q: Given the association of XMRV with patients whose blood was stored at WPI, how many other docs have sent samples that are positive?
- A: Contrary to the assumptions and misinformation about the samples in the WPI repository. These samples were NOT solely from the incline village outbreak. All samples were drawn from patients coming to Sierra Internal medicine between 2006 AND 2008. Fewer that 20 of the 101 were from the

original outbreak and more than 75 were sporadic cases of CFS from patients who came to Dr. Peterson from 12 states and Canada. The 101 were representative of patients satisfying CCC and Fukuda criteria throughout the US. At least 5 doctors from across the US including Dr Klimas and Dr Cheney had patients in the repository and in the study. The 101 patients were selected at random from the hundreds in the repository. The main consideration was that we had samples that could be cultured (retroviruses cannot multiply unless a cell divides and several samples from a given patient.

- Q: Are your "hit rates" different in the samples sent to you since the Science paper?
- A: Not as long as the physicians sending the samples are diagnosing as Dr Peterson does on CCC criteria. In fact the hit rates from overlapping diseases more than we expected now ~35%.
- Q: Given that a number of physicians who send you XMRV samples are also collecting HLA DR data, can we sort the positives and negatives by HLA DR haplotype, i.e., is there evidence of an increased relative risk for carriage of XMRV and presence of illness by HLA DR?
- A: We established the original WPI research program to look at the underlying genetics from the exact same population from which we were looking for novel viruses and correlating immune profiles and gene expression patterns. Therefore our collaborators Mary Carrington and Michael Dean of the NCI's genomic diversity program and the geneticists who identified the HLA and KIR susceptibility and resistance loci in HIV/AIDS have all of these studies well underway...some of these data were presented at last year's IACFS meeting. At that time we did not know XMRV status of those patients. Those data are currently being analyzed.
- Q: Do we know of any patients with acute acquisition of XMRV? How can you confirm a new case versus re-activation of transcription of intercalated viral material in DNA? What happens to their symptom with acquisition? What happens to their measures of innate immune responses?
- A: No. None of these studies can be done yet. We are working on cases of suspected "transfusion acquired" CFS which could establish an acute infection. These studies will require quantitative assays. The requirement that a diagnosis of CFS require an individual to be ill for 6months has precluded anyone from having such data. Hopefully at least one archaic practice will soon be gone ..the worst predictor of HIV disease progression is the viral set point and reservoir viral load. Set the reservoirs as low as possible! That is identify the infection as soon as possible. This is the best chance to prevent disease development and progression.
- Q: Do we know if genes carried by XMRV are being transcribed? If so would genomic data from samples collected by other labs be useful in a pooled analysis?
- A: XMRV is a simple retrovirus and encodes and expresses only the gag pol and env genes. ALL are expressed and proven to make functional proteins. This was clearly demonstrated in our Science paper. Gamma retroviruses do not cart or pick up cellular genes? Hope I answered the question because I don't understand the second part.
- Q: What regulatory mechanisms are felt to be present that would affect transcription of XMRV genetic material?
- A: Expression of XMRV and all simple retroviruses are controlled only by cis acting elements in the upstream untranslated region. In XMRV 3 transcriptional control elements have been identified two gluccocorticoid response elements (a strong one responding to androgens and estrogens, a weaker one responding to the stress hormone cortisol and an NfKB site) All turn on XMRV.
- Q: If XMRV is actively being transcribed, is there a difference in lab parameters and symptoms compared to those who carry XMRV but are without transcription?
- A: We don't have these data yet but that is a testable hypothesis.
- Q: If XMRV is present but inactive, are there any suggestions as to what could be a trigger for (re)-activation?
- A: Estrogens, Androgens, Cortisol (stress) and inflammation.
- Q: Given the problems with antigen presentation seen routinely in so many patients with chronic fatiguing illnesses, we would expect to see some patients with culture (+) XMRV who are antibody negative?
- A: Yes! We see lots of those...these data are very interesting and suggest immune therapy including antibody therapy may be most useful in this disease.
- Q: I heard that there may be another study in the U.K. that came to a different conclusion about a possible link between CFS and XMRV. Can you comment on the differing results, and whether the results of the two studies can be reconciled? Thank you.
- A: The negative studies were technically flawed in that their methods were demonstrated NOT to be capable of detecting XMRV. Their patient populations likely did not satisfy CCC criteria and they looked only by PCR on genomic DNA the least sensitive way of detecting XMRV. To date none one has attempted to replicate our study. It is very clear that the prevalence of XMRV in UK is NOT ZERO and that XMRV has been detected in CFS patients in the UK.
- Q: How might the finding of the XMRV virus relate to Lyme Disease?
- A: We are seeing XMRV in Chronic Lyme patients sent to us from several physicians. The hypothesis that chronic XMRV infection creates an underlying immune deficiency is consistent with many co-pathogens including Lyme.

2011 (Oct 04) - Chronic Fatigue Syndrome Researcher Fired Amidst New Controversy

Source - [HP002P][GDrive]

Judy Mikovits has had a rough few weeks. On 22 September, *Science* published online a **nine-lab study** widely seen as **the final blow to the theory**, **championed by Mikovits and colleagues in an October 2009 *Science* paper**, that a recently detected mouse retrovirus might play a causal role in chronic fatigue syndrome (CFS). A letter in the same issue of *Science* from one of the contributing labs to the 2009 report revealed that a contamination had marred its contribution—PCR detection and sequencing of the mouse virus, dubbed XMRV. Mikovits and colleagues defended the validity of the rest of the study,

known as Lombardi *et al*., which detected the virus by several other methods, so *Science* issued a rare partial retraction of the original paper.

Then on 29 September, Mikovits was fired from her job as research director of the Whittemore Peterson Institute for Neuro-Immune Disease (WPI), a private organization in Reno, Nevada, devoted to CFS research and treatment. Both Mikovits and WPI's CEO, Annette Whittemore, say the firing was not related to the XMRV theory's demise.

The very next day, a graduate student who writes a snarky blog that has been highly critical of Mikovits and the XMRV theory raised questions about whether a figure in Lombardi *et al*. had been misrepresented. *Science* Executive Editor Monica Bradford said in a statement that the journal is investigating the allegation. "As is our policy in cases of alleged figure manipulation, we follow up with the research authors as soon as our own review of the allegation is complete," said Bradford. "*Science* takes all such matters seriously and seeks to respond thoroughly and efficiently."

The furor revolves around an image—the bottom half of Figure 2C in Lombardi *et al*.—that shows XMRV proteins in CFS patients but not healthy controls. In her blog known as ERV (endogenous retroviruses), Abbie Smith on 30 September noted the striking similarities between Figure 2C and a slide Mikovits presented at a CFS meeting in Ottawa, Canada, on 23 September. Smith, who is working on her doctoral dissertation at the University of Oklahoma, Oklahoma City, and studies HIV, wrote that an anonymous tipster had pointed out to her that the two images looked identical but had different patient numbers and experimental conditions. Smith questioned whether this was a simple mistake or an attempt to recycle old data to make a new argument.

The Ottawa slide supported Mikovits's contention that even if XMRV could not be detected in CFS patients, other gammaretroviruses still lurked in their chromosomes. Mikovits described how she had treated cells from two CFS patients with a chemical, 5-azacytidine, that takes methyl groups off DNA. This procedure prods cells that harbor latent versions of retroviruses to produce them, and the image on the slide showed the resultant proteins in what's known as a Western blot gel. In Lombardi *et al*. what appears to be the same image shows "XMRV proteins" and makes no mention of 5-azacytidine use.

Mikovits's collaborator, Francis Ruscetti of the National Cancer Institute (NCI) in Frederick, Maryland, who ran all of the Western blots, confirms that the Ottawa slide uses the same image that appears in Lombardi *et al*. Ruscetti and Mikovits, in a joint e-mail to *Science* for this article, said many patients and their doctor, Daniel Peterson (who since has had a falling out with WPI), knew the original coded numbers, so the researchers changed them for the *Science* publication to "protect the patient privacy." Ruscetti says it was a mistake for Mikovits to have used the original patient codes in Ottawa. "We were under so much pressure, we missed it," says Ruscetti.

As far as the use of 5-azacytidine, Ruscetti and Mikovits stressed in their e-mail that "there was no attempt in the original paper to hide anything." They say for the purposes of Lombardi *et al*., the use of 5-azacytidine was not germane: They were simply trying to demonstrate that CFS patients had viral proteins not seen in controls. By the time of the Ottawa meeting, they say they realized that this experiment did not in fact show XMRV but proteins from a broader family of gammaretroviruses.

After Lombardi *et al*. appeared, several laboratories had reported that they could not detect XMRV in CFS patients. **But Ruscetti and Mikovits note that most of these studies relied on polymerase chain reaction, which used DNA sequences of XMRV to fish out pieces of the virus from blood samples.** Those tests, they point out, would have missed other gammaretroviruses with different sequences. The Western blot assay they used in Lombardi *et al*. just so happened to cast a wider net that uncovered proteins from any member of the gammaretrovirus family. In addition, they say, the use of 5-azacytidine made clear that these infections would be missed in routine assays, as these viruses often exist in a latent state.

On the ERV blog, Smith and others also argued that the study lacked proper controls: the healthy controls in this experiment did not have 5-azacytidine added to their samples. "My [principal investigator] would say 'Why did you run this gel?' if I handed it to him," wrote Smith.

Vinay Pathak, a retrovirologist at NCI who earlier damaged the XMRV/CFS theory with a study published in *Science* that documented how the virus was accidentally created in laboratory experiments, says he is "bewildered" by Ruscetti's and Mikovits's explanations about Figure 2C. "If [5-azacytidine] was used in the original experiment, it's an egregious error to leave it out of the *Science* paper," says Pathak. "It makes a difference how I would interpret the results."

Jonathan Stoye, a retrovirologist who once supported the XMRV/CFS hypothesis but subsequently changed his mind after his own studies failed to replicate the finding, says its time to retract Lombardi *et al*. in its entirety. "I think there's a point where *Science* has to say, there is no substance to this paper," says Stoye. "It was published with a message, and that message is gone."

Neither Lombardi *et al*. nor the questions about the slides were mentioned in Whittemore's 30 September letter formally terminating Mikovits's contract, sent the day after the two had a heated phone conversation. **In that letter Whittemore charged her high-profile researcher with being "insubordinate and insolent."** Mikovits was immediately locked out of her lab.

Three letters between Whittemore and Mikovits say the firing hinged on Mikovits's failure to pass on a cell line that was sent to Vincent Lombardi, the first author of the October 2009 *Science* paper who runs UNEVX (formerly known as VIPDx), a diagnostic laboratory owned by WPI. Until recently, the lab sold a test for XMRV and related viruses.

In a 1 October written response to Whittemore, Mikovits contended that it was "completely appropriate" for her, as research director, not to give Lombardi the cell line. The cell line was not related to studies of the gammaretroviruses, but Lombardi wanted to use it for experiments connected to a grant Mikovits had secured from the U.S. National Institutes of Health to study possible causes of CFS. Mikovits contended that Lombardi "was unwilling to take my direction" and should not be undertaking a new project "while neglecting his other duties." She also questioned his ability to carry out that experiment.

Annette Whittemore issued a statement to *Science* in which she strongly defended Lombardi's performance. "Dr. Lombardi is a valued and important part of our team, and conducts his research work accordingly," wrote Whittemore. "While personnel matters are generally confidential, the statements made by Judy Mikovits are wrong, without merit and those of a disgruntled former employee."

In an interview with *Science*, Mikovits contended that her firing was also linked to a longstanding battle about WPI's decision to sell, through VIPDx/UNEVX, a test for human gammaretroviruses. The lab began offering the tests, which cost around $500, shortly after Lombardi *et al*. reported a link between XMRV and CFS. Some patients who tested positive went on to take antiretroviral drugs. "I said, 'No, no, no, no,' " says Mikovits of the test. "I've asked them for the better part of 2 years to show me that what we got in Lombardi *et al*. is the same thing they're selling to patients."

The issue came to a head with the recent publication by *Science* of the nine-lab study. The so-called Blood Working Group, which included the labs run by Mikovits and Ruscetti, failed to reliably find XMRV or other gammaretroviruses in blinded samples from people who previously had tested positive for these viruses. Both Mikovits and Ruscetti co-authored the paper, which invalidated their own assays for XMRV. WPI says UNEVX has stopped offering the

diagnostic tests, but did not give details about the timing or reasons.

Whittemore, who refers to CFS as myalgic encephalomyelitis (ME)—a common name for CFS in Europe—stressed that the institute remains devoted to studying human gammaretroviruses in "ME and related diseases" and that no one there "would ever put self interest ahead of research or finding the causes of ME."

Mikovits, who says she currently does not even have access to her laboratory notebooks, is looking for another institution to continue her work.

2011 (Dec 23)

2012 (Feb 06) - NY TImes article - "Fallout From Fatigue Syndrome Retraction Is Wide"

See [HN00S1][GDrive]

When scientists reported in 2009 that a little-known mouse retrovirus was present in a large number of people with chronic fatigue syndrome, suggesting a possible cause of the condition, the news made international headlines. For patients desperate for answers, many of them severely disabled for years, the finding from an obscure research center, the Whittemore Peterson Institute for Neuro-Immune Disease in Reno, Nev., seemed a godsend.

“I remember reading it and going, ‘Bingo, this is it!’ ” said Heidi Bauer, 42, a mother of triplets in Huntington, Md., who has had chronic fatigue syndrome since her 20s. “I thought it was going to mean treatment, that I was going to be able to play with my kids and be the kind of mom I wanted to be.”

Patients showered praise on the lead researcher, Dr. Judy Mikovits, a former scientist at the National Cancer Institute. They sent donations large and small to the institute, founded by Harvey and Annette Whittemore, a wealthy and politically well-connected Nevada couple seeking to help their daughter, who had the illness.

In hopes of treating their condition, some patients even began taking antiretroviral drugs used to treat H.I.V., a retrovirus related to the murine leukemia viruses suddenly suspected of involvement in chronic fatigue syndrome.

More recently, however, the hopes of these patients have suffered an extraordinary battering. In a scientific reversal as dramatic and strange as any in recent memory, the finding has been officially discredited; a string of subsequent studies failed to confirm it, and most scientists have attributed the initial results to laboratory contamination. In late December, the original paper, published in the journal Science, and one other study that appeared to support it were retracted within days of each other.

As the published evidence for the hypothesis fell apart, a legal melodrama erupted, dismaying and demoralizing patients and many members of the scientific community. Dr. Mikovits was even briefly jailed in California on charges of theft made by the institute.

“I’m stunned that it’s come to this point,” said Fred Friedberg, a professor at Stony Brook University Medical Center and president of the International Association for C.F.S./M.E., a scientific organization. “This is a really sad unraveling of something that was perhaps going to generate a whole new direction in this illness.”

Despite the controversy, Dr. Mikovits is now supervising some lab work as part of a large government-sponsored study being spearheaded by [**Dr. Walter Ian Lipkin (born 1952)**], a leading Columbia University virologist. The study was established before the two retractions to examine the possible link between chronic fatigue syndrome and mouse retroviruses. Dr. Mikovits still hopes to replicate her original results, and many patients continue to believe fervently in her hypothesis; study results are expected early this year.

She did not respond to requests for comment.

An estimated one million people in the United States suffer from chronic fatigue syndrome, which is characterized by profound exhaustion, a prolonged loss of energy following minimal exertion, swollen lymph nodes, sore throat, cognitive dysfunction and other symptoms. Experts now generally believe that one or more infectious agents, or perhaps exposure to toxins, set off a persistent, hyperactive immune response — the likely cause of many of the symptoms.

Although the Centers for Disease Control and Prevention first investigated the illness in the mid-1980s, the agency has not been able to find a cause, identify any biomarkers or diagnostic tests, or develop effective treatments. Patients have long accused the mainstream medical and scientific community of neglect and abandonment. Many say that the C.D.C. has largely treated their disease as a psychological or stress-related condition.

A 2010 paper from the agency, for example, galled patients with the conclusion that they suffer disproportionately from “paranoid, schizoid, avoidant, obsessive-compulsive and depressive personality disorders.”

Dr. Mikovits’s research, done with collaborators from such prestigious organizations as the National Cancer Institute and the Cleveland Clinic, seemed to vindicate the concerns of many with the condition. The scientists said they had found that 67 percent of patients sampled were infected with a mouse virus called XMRV, compared with 4 percent of the controls.

“If for years you’ve been told that your illness is all in your head and then you’re being told, ‘Look, we found something concrete and very substantial,’ then of course there will be rallying behind that,” said Rivka Solomon, 49, a Massachusetts playwright who has been largely homebound with the syndrome for more than 20 years.

The publication of Dr. Mikovits’s work brought immediate attention, much of it unflattering. Other scientists soon published studies challenging the findings, and Science issued first a statement of concern and then a partial retraction of the original study.

Even as her work was publicly debated, the blunt and feisty Dr. Mikovits raised eyebrows among other scientists for stating at conferences that murine leukemia viruses could be related to autism. Perhaps more disconcerting, a commercial lab associated with the Whittemore Peterson Institute began marketing screening tests for XMRV, the hypothesized cause of chronic fatigue syndrome, costing hundreds of dollars. The business enraged many patients once they realized the results might be meaningless.

Amid mounting concerns, Dr. Mikovits left her position as research director at the institute in a dispute over management practices and control over research materials. The institute sued her, accusing her of stealing notebooks and other proprietary items. Dr. Mikovits was arrested in Southern California, where she lives, and jailed for several days, charged with being a fugitive from justice.

After her split with the institute, Dr. Mikovits denied having the missing laboratory materials. But a lab employee, Max Pfost, said in an affidavit that he took items at her request, stashing notebooks in his mother's garage in Sparks, Nev., before turning them over to Dr. Mikovits.

At one point, "Mikovits informed me that she was hiding out on a boat to avoid being served with papers from W.P.I.," Mr. Pfost said in the affidavit. Some lab items have since been returned.

In December, a judge ruled against her in the civil case. The criminal case is pending; another hearing in the civil case is in late February. But in late January, the Whittemores were themselves accused of embezzling millions of dollars in a lawsuit filed by partners in Mr. Whittemore's real estate business.

The Whittemores, who have countersued, maintain their innocence of the embezzling charges, and Annette Whittemore stated in an e-mail that institute research continues.

The events of the past couple of years, though disheartening to chronic fatigue syndrome patients, may have a silver lining: Research into the disease, much of it privately financed, is ratcheting up.

A new research and treatment center has been created at Mount Sinai Hospital in New York. The Hutchins Family Foundation is investing $10 million in the Chronic Fatigue Initiative, an effort to find causes and treatments that has recruited top researchers from Columbia, Harvard, Duke and other institutions.

"The disease had languished in the background at N.I.H. and C.D.C., and other scientists had not been paying much attention to it," said John Coffin, a professor of molecular biology at Tufts University. "This has brought it back into attention."

Dr. Coffin, who at first supported the mouse retrovirus theory but later disputed it, noted that the illness "does seem to have characteristics that would suggest infectious origins" and that other retroviruses could be involved.

Despite the personal and professional setbacks for Dr. Mikovits, many patients, like Ms. Solomon, continue to believe that a retrovirus is causing their illness.

"But even if the retroviral research does not pan out, her work, and the publicity it has brought to our illness, has forever changed the landscape," said Ms. Solomon.

2012 (June 14) - NY TImes - "No Theft Charge for Chronic Fatigue Researcher"

See [HN00S2][GDrive]

Nevada authorities have dropped criminal charges against a researcher who gained wide attention for scientific reports linking chronic fatigue syndrome to an obscure mouse retrovirus.

The researcher, Judy A. Mikovits, had been charged with stealing proprietary laboratory materials from her former employer, the Whittemore Peterson Institute for Neuro-Immune Disease in Reno, Nev. She still faces related civil claims that the institute filed after her departure.

In October 2009, the journal Science published a study, with Dr. Mikovits as senior author, indicating that a disproportionate percentage of patients with the syndrome were infected with a mouse retrovirus, XMRV. But subsequent studies failed to confirm the initial findings. Other scientists argued that laboratory contamination was the cause of the apparent association.

As the hypothesis fell apart, so did the relationship between Dr. Mikovits and the institute. Dr. Mikovits left in September. In November, she was arrested and briefly jailed as a result of criminal charges filed by prosecutors in Washoe County, Nev., after the institute's allegations of theft.

In December, Science retracted her original paper. She is still involved in a large chronic fatigue syndrome study, whose findings are due this summer.

Harvey and Annette Whittemore, who founded the institute, have themselves been sued by former partners, who accused them of embezzling millions of dollars from a real estate business. Mr. Whittemore was indicted last week by federal prosecutors on charges of making illegal campaign contributions. He pleaded not guilty.

In March, the judge in the civil case against Dr. Mikovits disclosed that he had received campaign donations from Mr. Whittemore and recused himself.

2012 (September) - Conference

Info - [HV003Y][2012-09-youube-judy-mikovits-wrong-description-text.txt]

YouTube Video - [HV003X][2012-09-youube-judy-mikovits-wrong.mp4]

Skip to 19:00 to hear Judy say "We so rigorously excluded our initial findings..."

In 2009, Judy Mikovits was a research director at the Whittemore Peterson Institute (WPI), a private research center in Reno, Nevada. That year, she co-authored a paper in Science that suggested an obscure agent named xenotropic murine leukemia virus-related virus (XMRV) caused chronic fatigue syndrome (CFS).

The cause of CFS, also called myalgic encephalomyelitis, had long remained elusive, and the disease had been neglected by science. The study created hope that CFS might become treatable with antivirals. Some patients even began to take antiretroviral drugs used by HIV-infected people. But the paper also created worries that XMRV might spread via the blood supply.

Other researchers soon questioned the findings, and over the next 2 years, the paper's claims fell apart. Researchers showed that XMRV was created accidentally in the lab during mouse experiments; it may never have infected any humans. The authors first retracted two figures and a table from the paper in October 2011. Around the same time, a study by several labs, including WPI itself, showed the findings couldn't be replicated. Two months later, the entire Science paper was retracted.

Mikovits refused to sign the retraction notice, but she took part in another major replication effort. That $2.3 million study, led by [**Dr. Walter Ian Lipkin (born 1952)**] of Columbia University and funded by the National Institutes of Health, was "the definitive answer," Mikovits said at a September 2012 press conference where the results were announced. The rigorous study looked for XMRV in blinded blood samples from nearly 300 people, half of whom had the disease, and none had the virus. "There is no evidence that XMRV is a human pathogen," Mikovits conceded.

This is the video of that press conference.

Around this same time, Mikovits had an explosive breakup with WPI. The institute filed suit against her in November 2011 for allegedly removing laboratory notebooks and keeping other proprietary information on her laptop, on flash drives, and in a personal email account. She was arrested in California on felony charges that she was a fugitive from justice and jailed for several days. Prosecutors in Washoe county, Nevada, eventually dropped criminal charges against her in June 2012.

Soon after this press conference, she began to promote the XMRV hypothesis again, and attack this very study that she agreed had put the issue to rest. Her discredited work and her legal travails have made her a martyr in the eyes of some. Source:

CII Press Conference: 9/18/12

"Multicenter Study on Chronic Fatigue Syndrome/Myalgic Encephalomyelitis"

2014 resume (CV)

Source - [HL0041][GDrive]

Innovative Cellular and Molecular Biologist with over 20 years of scientific expertise as a PhD in life sciences, including planning, directing and implementing programs in HIV, Cancer, Epigenetics, Neuro-immune disease with a focus on development of novel drug and diagnostic technologies. Demonstrated leadership in introducing and establishing new programs and technologies, efficiently organizing and standardizing processes, and effectively managing multiple projects and personnel. Solution-oriented team-player with strong supervisory, project management, and problem solving skills. Ability to build solid multicultural teams within start-up and changing environments and demonstrated ability to foster strong relationships with strategic partners, collaborators, cross-functional teams, and scientific advisors.

PROFESSIONAL EXPERIENCE

PROFESSIONAL EXPERIENCE

- **MAR CONSULTING INC.（2013 - present）**
  - **Founder/Consultant**
  - **Mission Statement**
  - MAR Consulting Inc., led by Drs. Frank Ruscetti and Judy Mikovits, seeks to understand complex and innovative biological issues to yield unbiased integrated, cutting-edge information for patients and physicians impacted by some of the most challenging chronic diseases. Utilizing their combined 75 years experience in tumor biology, immunobiology of retroviral-associated inflammatory diseases, cancer, stem cell biology, hematopoiesis, and drug development, MAR focuses on research projects, consulting (to patients doctors, academia, and industry) and lecturing without the restrictive authority of vested interest groups, following Thomas Jefferson's dictum: "Here we are not afraid to follow the truth wherever it may lead, nor to tolerate error so long as freedom is left free to combat it."
- **YORKBRIDGE CAPITAL （2012 - present）**
  - **Advisor**
  - York Bridge Capital is a Toronto-based private equity firm focused on early stage Canadian technology companies. My role is in management advisory services for the medical devices and diagnostics sector.
- **GENYOUS BIOMED（2006 - 2012）**
  - **Senior Scientist/Consultant**
  - As a senior scientist I developed multivalent drugs for inflammation, immune modulation and virology targets. Genyous' Multifunctional Multi-

targeted (MFMT™) drug development platform is based on systems biology considerations that recognize the complex nature of chronic diseases and addresses the crosstalk between cells, their microenvironment (stroma) and the immune response system. Genyous' drug candidates are formulated with well-tolerated doses of actives derived from natural products that have a long history of safe consumption and which are orally bioavailable. MFMT™ drug design also minimizes disruption of homeostasis, thus reducing risk of toxicity and development of drug resistance. Genyous' multivalent drugs are designed to address the heterogeneous nature of chronic diseases by possessing multiple therapeutic functions and acting on multiple biological targets. As a consultant, I interacted with academic collaborators world-wide to establish milestones for MFMT research in prostate cancer, autoimmune and neuroimmune disease.

- **Whittemore Peterson Institute For Neuroimmune Disease (WPI)** (**2006 - 2011**)
  - **Research Director,** (11/2006- 10/2011)
  - I joined the Whittemore Peterson Institute for Neuro-immune Disease (WPI) in November of 2006 as the WPI's first Research Director. Responsible for establishing a translational research program aimed at identifying biomarkers and underlying causes of Chronic Fatigue Syndrome (CFS) and other debilitating neuro-immune diseases with overlapping symptoms such as Fibromyalgia (FM), Chronic Lyme Disease, Atypical Multiple Sclerosis and Autism Spectrum Disorder (ASD). As Research Director, I was responsible for planning, establishing and directing the Institute's scientific research program, including the selection, training and supervision of staff, writing, obtaining and managing grants and collaborating with other scientific organizations. The WPI under my direction grew from a small foundation to an internationally recognized center for the study of neuro-immune diseases in which I obtained investigator initiated grant money from the NIH and Department of Defense and brought international attention to ME/CFS as a physiological disease. Proven ability to recognize and recruit important collaborators and partners developing strong relationships within multiple scientific disciplines.
- **EPIGENX BIOSCIENCES, SANTA BARBARA, CA** (**2005 - 2006**)
  - *A holding company for technologies developed in EpiGenX Biosciences*
  - Chief Scientific Officer,
  - This company was formed to market intellectual properties and technologies developed in EpiGenX pharmaceuticals in order to get treatments to patients faster. As Chief Scientific officer, my job was to identify suitable business partners for product commercialization. We achieved this goal in less than two years and succeeded by having the lead compound acquired by a major pharmaceutical company and into clinical trials and our diagnostic platform licensed to a platform company.
- **EPIGENX PHARMACEUTICALS, SANTA BARBARA, CA** (**2001 - 2004**)
  - *A startup biotech company whose mission was to develop and commercialize cancer therapeutics and Diagnostics targeting aberrant DNA methylation in Cancer.*
  - **Director of Cancer Biology,**
  - Established, directed and managed a team charged with discovering and developing small molecule therapeutics targeting aberrant DNA methylation. In order to achieve this mission we needed first to develop multiplexed, higher throughput assays for determining methylation status of cellular genes.
- **BIOSOURCE INTERNATIONAL**, Camarillo, CA (Now part of **LIFE TECHNOLOGIES**) **2002 - 2004**
  - *A biotechnology company, which manufactures, markets, and distributes assays and biological reagents for drug discovery, functional proteomics, and biomedical research.*
  - Group Leader, Luminex Platform Research & Development.
  - Organized and directed a team for new product development on the Luminex platform technology for multiplex proteomics assays. Coordinated development and manufacturing of over 50 distinct Luminex assays including the first 30plex assay for human cytokines and chemokines. Responsibilities also included evaluation of external multiplex proteomic technologies and applications for corporate partnership, OEM opportunity and licensing, which led to a contract to commercialize a technology for development of a fully automated platform technology for both multiplex gene expression and proteomic assays on a single platform.
- **LABORATORY OF ANTIVIRAL DRUG MECHANISMS** (**1999 - 2001**)
  - **Screening Technologies Branch**, a division of the Developmental Therapeutics Branch of the National Cancer Institute, Frederick MD
  - **Lab Director,**
  - Established and managed a new laboratory to develop drugs targeting AIDS-associated malignancies, the first of which was Kaposi's Sarcoma, which had been recently associated with a new herpes virus. I hired a multidisciplinary team with expertise in high throughput screening, retroviruses, herpes viruses and medicinal chemists. This laboratory became internationally recognized as the first of its kind in cancer drug development developing multi-functional drugs to target pathogens as well as inflammation to fight cancer.
- **NATIONAL CANCER INSTITUTE, LAB OF LEUKOCYTE BIOLOGY** (**1994 - 1998**)
  - Staff Scientist
  - Established and managed an independent research laboratory involved mechanisms by which retroviruses disrupt the delicate balance of the immune system to contribute to disease. Pioneered the field of epigenetic dysregulation of cellular genes by human retroviruses
- **NATIONAL CANCER INSTITUTE, LAB OF GENOMIC DIVERSITY** (**1992 - 1994**)
  - Post Doctoral Fellow, Molecular Virology
  - Constructed and characterized the first infectious molecular clone of HTLV1. Investigated the role of defective provirus in HTLV-1 associated myelopathy (HAM/TSP)
- **NATIONAL CANCER INSTITUTE, LAB OF LEUKOCYTE BIOLOGY** **1983 - 1991**
  - Research Technician II-III,Research Associate, conducted biological and molecular experimentation in HIV AIDs and cancer as a part of the Biological Response Modifiers Program the NCI's first translational research program.
- **NATIONAL CANCER INSTITUTE, FERMENTATION CHEMISTRY PROGRAM** **1980 - 1982**
  - Research Technician I, purification of Interferon alpha, Interleukin 2, and numerous chemotherapeutics for human clinical trials.

EDUCATION

- Postdoctoral Scholar: Molecular Virology
- Laboratory of Genomic Diversity, National Cancer Institute with David Derse, Ph.D.
- Ph.D., Biochemistry and Molecular Biology, George Washington University, Washington, DC Doctoral Thesis: HIV Latency and mechanisms of Immune activation In Monocytes
- B.A., Biology with specialization in Biochemistry.☐ University of Virginia, Charlottesville, VA

PROFESSIONAL SOCIETIES AND AWARDS

- 2012 HHS Special recognition award
- AACR
- DNA Methylation Society
- AAI
- 1991 George Washington Graduate student of the year

2014 (Nov. 24) - (Ventura County Star) - World-known Oxnard researcher claims she was smeared, pushed out

2014-11-24-ventura-county-star-world-known-oxnard-researcher-claims-she-was-smeared

http://archive.vcstar.com/news/local/oxnard/world-known-oxnard-researcher-claims-she-was-smeared-pushed-out-ep-792662230-350412251.html

The biochemist was fired, then arrested on suspicion of stealing research notebooks — her own research notebooks — from her lab and ultimately shackled to a woman nicknamed Crazy Mary.

She authored a study that turned the science world on its ear, interpreted as a step toward curing a disease, chronic fatigue syndrome, that affects more than 1 million Americans.

In dramas that unfolded as one of the study's primary conclusions was proved wrong, she lost everything: research opportunities, money, reputation.

Judy Mikovits, sitting in her 38-foot fishing boat in a racket club cap and flip-flops, said through it all she was never given a chance to tell her story.

So she spent weeks and months on this boat, the Pura Vida, in the Channel Islands Harbor, talking, sometimes yelling, into a cellphone. She told of experiences that melded retroviruses named with acronyms with allegations of conspiracy and being blackballed.

The result, "Plague," written by Mikovits and Kent Heckenlively and released by Skyhorse Publishing, hit bookstores Tuesday.

"I was forced out of science because I found an inconvenient truth," she said.

GLIMPSE OF HOPE

Before her life slid out of control, Mikovits split time between a laboratory in Reno and the home near Channel Islands Harbor she shared with her husband, David Nolde. She served on a race committee at the Pierpont Bay Yacht Club, volunteering her services as a club bartender.

Known as Judy Nolde, she worked with cancer patients at Community Presbyterian Church in Ventura, where her husband was a church elder.

She was a researcher who said her grandfather's death to cancer spurred her to a career focused on finding cures. She worked for more than 20 years at the National Cancer Institute, then later at EpiGenX Biosciences in Santa Barbara.

Nearly a decade ago, her studies turned from HIV and cancer to chronic fatigue syndrome, a mysterious, incurable disease marked by exhaustion, pain and memory loss. People with the condition may stay in darkened rooms due to light sensitivity, layering themselves with blankets because their bodies struggle to register warmth.

"I felt the illness had been stigmatized by the scientific community," said Robin Moulton, a Mikovits supporter from Portland who has struggled with chronic fatigue for 20 years. " ... There are no tests for diagnosis, treatment or any chance of cure."

At an institute created by Reno lawyer and former lobbyist Harvey Whittemore and his wife, Anne, Mikovits led a study that offered an explanation for the disease. The work claimed the syndrome was linked to a virus that converts itself into DNA and stays with a person for life. Defined as a retrovirus, it's called XMRV.

The discovery signaled hope. If the disease was caused or even just linked to a retrovirus, scientists might uncover ways to treat it, maybe cure it.

"All these patients went nuts," said Vincent Racaniello, a virologist from Columbia University in New York. "They could finally see an end to the suffering."

The discovery bought acclaim and controversy. Unable to duplicate the studies, some scientists challenged the finding.

Mikovits defended her work. She contended retroviruses could also be linked to autism. Patients from around the world blogged and emailed their support.

"I think they feel she was trying to help this patient population, which has been, like I say, stigmatized," said Moulton, who dismissed the challenges to Mikovits' work.

"It just seemed like a lot of negative paper came out quickly," she said. "It almost seemed like they were trying to take the focus off it."

GETTING WEIRD

A strange but not unprecedented story of challenged science turned bizarre three years ago on a November Friday.

A woman came to the door of Mikovits' beachside home outside of Oxnard, claiming to be a patient. Instead, she was a campus police officer from the University of Nevada, Reno. Another Nevada officer came from the bushes. Ventura County Sheriff's Office deputies emerged from the driveway.

Mikovits was arrested.

She had been fired by the Whittemore Peterson Institute in September over a dispute that involved turning over a cell line to another researcher. After the termination, her laboratory was searched, Mikovits said.

She worried about research notebooks kept in drawers that she was told had been unlocked. They contained her work on XMRV and other studies. They also revealed patient information. She told her assistant to secure the records.

The Whittemores went to the police accusing her of theft. The arrest made national news and led to five days in jail.

"The word I would use is surreal," Mikovits said. "There's a 24-hour light in your eye. There's no pillow. There are no bars. There's a locked door."

To this day, she defends her choice to have the notebooks removed from the lab.

"If we had left those notebooks unsecured, patient names would have been exposed," she said. "It's like letting your credit card information get out."

FORCED OUT

She said she lost everything.

The Whittemores sued her. A judge said she was in default because she refused to turn over materials that Mikovits' lawyer said were protected because of

the criminal charges stemming from her arrest.

The criminal case was later dropped. Mikovits filed bankruptcy. Her Oxnard area home was sold. She said the notebooks that triggered her arrest are being held under permanent court injunction, meaning she can't touch them.

The journal that published her study printed first a partial, then a total retraction. A 2012 study led by [Dr. Walter Ian Lipkin (born 1952)] and also involving Mikovits showed that XMRV was the result of lab contamination.

The study means XMRV isn't linked to chronic fatigue syndrome, Mikovits said. She also said her research shows a connection to a different, still unidentified retrovirus.

That is the inconvenient truth.

"Retroviruses and environmental toxins led to this explosion of chronic diseases," she said.

Mikovits wants more research on the retroviral connection not only to chronic fatigue, but cancer, autism and other conditions. She pushes for more studies on the role vaccines and chemicals in the environment play in the diseases.

She doesn't expect to be involved in the studies or to get a whiff of government research funding.

"She absolutely was blackballed," said Frank Ruscetti, her research partner in the XMRV study. He said the study and its false conclusion were used to punish Mikovits.

"They did their best to portray it as scientific mischief instead of honest science that didn't understand the exotic biology of this virus," he said.

'PLAGUE OF INTEGRITY'

Mikovits contends leaders of the U.S. Centers for Disease Control and Prevention and the National Institutes of Health saw her work as a threat to their long-held claims the disease was not affected by the environment. She said government officials have long fought efforts to change the way society views chronic fatigue, fearing it would show they covered up what they already knew.

She said her grants from the National Institutes of Health were taken away and given to someone else. She said she was barred from setting foot on the National Cancer Institute, where she once worked.

She said the contaminant that emerged in her study came from a Cleveland lab involved in a study that falsely linked XMRV to prostate cancer. That study wasn't vilified, Mikovits said, but hers was.

"It's a plague of integrity," Mikovits said, explaining her book's title. "The real plague is the censorship and special interests."

National Institutes of Health Officials offered no comment on Mikovits' allegations, saying they support a better understanding of chronic fatigue syndrome. Other observers said they saw no evidence of a conspiracy or government suppression.

"Nobody had anything against Judy," said Vincent Racaniello, a virologist from Columbia University, citing Mikovits' efforts to defend her work. "She was simply in the wrong and only at the end did she really admit it."

Boston researcher John Coffin is described in the book as the grand old man of virology and a supporter of Mikovits' study who became a foe. He also said he saw no evidence of a conspiracy.

As far as Mikovits' future, he said he would consider collaborating with her in the right situation.

"I don't know if she would collaborate with me," he said.

DESPERATE TO HELP

The story twists more than a tornado. Harvey Whittemore, once Mikovits' employer, was convicted of funneling $133,000 in illegal campaign contributions to his friend, Sen. Harry Reid, the Senate minority leader. Reid was not accused of wrongdoing.

Whittemore is serving a two-year sentence in federal prison in Lompoc.

Mikovits and her husband live off the pension from his years as personnel director at the Ventura County Health Care Agency. They split time between a small home in Carlsbad and the Channel Islands Harbor. Their boat is up for sale.

She thinks she has been slandered. She probably won't sue.

"To sue, you have to have a lawyer," she said. "You have to have money."

She formed a consulting company with Ruscetti in Carlsbad. She keeps up to date on research and tries to help the patients who still keep constant contact.

She wants to do more. Moulton, the woman with chronic fatigue, wants the same thing.

"She has so much experience with these things," Moulton said, referring to cancer, HIV and chronic fatigue. "I think the world would be better with her in a lab."

This story has been corrected from the original version, which misstated details regarding a search of Mikovits' office. Mikovits said the drawer containing her research notebooks had been unlocked, triggering her request the notebooks be secured.

2014 (April) - "Cannabis as Immunonotherapy for 21st Century Acquired Immune Deficiencies" presented by Judy Mikovits

Video - [HV0044][GDrive]

Presented At:

Cannabis Sciences Virtual Event 2018

Presented By:

Judy Mikovits, PhD - Founder/Consultant at M.A.R.C. INC and Director of Cancer Biology at EpiGenX Pharmaceuticals

Speaker Bio:

Dr. Judy A. Mikovits earned a BA in Chemistry with a specialization in biology from the University of Virginia in 1980 and a PhD in biochemistry and molecular biology from George Washington University in 1992. Upon graduation from UVA, she went directly to the National Cancer Institute in Frederick Maryland where she developed purification methods for Interferon alpha. It was this Interferon which was used in the first immune therapy treatment for hairy cell leukemia in 1986. In 1986-7, prior to enrolling in graduate school. she went to Upjohn Pharmaceuticals in Kalamazoo Michigan to develop production methods to insure biological materials manufactured using human blood products were free of contamination from HIV-1. Her PhD thesis defense entitled "Negative Regulation of HIV Expression in Monocytes" changed the paradigm for therapeutic treatment of HIV. For this work, she was awarded the graduate student of the year in 1991. In her thirty-five-year quest to understand and develop therapies for chronic diseases, she has co-authored seminal papers culminating at least a decade of research in each of four fields: immunology, natural products chemistry, epigenetics, and HIV/AIDs drug development. In 2006, Dr. Mikovits became attracted to the plight of families with neuroimmune diseases including ME/CFS and Autism and was primarily responsible for demonstrating the relationship between environmentally acquired immune dysfunction, chronic inflammation and these diseases. Her pioneering work during a twenty year career at the National Cancer Institute includes the discovery of the modulation of DNA Methylation machinery by human retro viral infection and the development of the concept of inflammatory cytokines and chemokine signatures of infection and disease, which was first published in 1999, when Dr. Mikovits directed the Laboratory of Antiviral Drug Mechanisms in developing therapeutics and diagnostics for HIV/AIDS and AIDS associated malignancies.

Webinar:

Cannabis as Immunonotherapy for 21st Century Acquired Immune Deficiencies

Webinar Abstract:

It has only been in the last 20 years that we, the scientific/medical community, have appreciated the role of the endogenous Cannabinoid system (ECS) in maintaining a healthy immune system and brain. More recently, we recognized that the ECS is critical for stem cell development and homeostasis. The phytocannabinoid, THC is a modulator of Hematopoietic Stem Cells (HSC). It acts in part via stimulation of TGF beta production. The modulation of TGF beta, HSC and the NFkB by other natural product immunotherapy via some of the same pathways as THC suggest opportunities for synergy and decreasing psychoactive effects.

Combinations of phytocannabinoiss can be used as stem cell and immune therapy in combination with other natural products and chemotherapy as curative treatment strategies for cancer, AIDS, Autoimmune disease and chronic inflammatory diseases. Moreover, Evidence is accumulating that THC is actually reduces opioid addiction by modulating endogenous opioids. Endogenous opioids are peptides derived from food which can also modulate immune cells including hematopoietc stem cells and be valuable therapeutics against HIV/AIDS and Cancer as our collaborator, Candace Pert demonstrated in the 1980s when she/we developed peptide T as an AIDS and cancer therapeutic (book Molecules of Emotion). Endocannabinoids, phyto-cannabinoids, and opioids modulate the immune system, hematopoietic and mesenchymal stem cells, it may also modulate the opioid pathways to reduce addiction.

2. Judy Mikovits, Ph.D. (for Petitioners), vs. Andrew MacGinnitie, M.D. (for Respondent)

As noted above, Dr. Mikovits has qualifications as a researcher in biochemistry and molecular biology. Based on those credentials, her opinions regarding chemistry and molecular biology might deserve a certain amount of deference -- but only her opinions in those subjects. The scope of her expert testimony in this case, however, went *far beyond* those subjects, and veered into providing opinions on medical disciplines in which she was *wholly unqualified*. (*E.g.*, Tr. 958-59; Ex. 236, pp. 12-13.) At the start of the evidentiary hearing, Dr. Mikovits even admitted on direct examination that she was an expert "as to nothing" (Tr. 163), and that she was *not* a clinician that could testify on the many medical specialties relevant to this case (Tr. 204). But Dr. Mikovits' position regarding her own areas of expertise drastically shifted towards the end of the litigation, when she stated, quite unbelievably, that she was testifying on rebuttal to rebut "all" of Respondent's experts in this case, and claimed that she had "an expertise in every area" of the case in order to provide such rebuttal testimony. (Tr. 974.)

In contrast, Dr. MacGinnitie, Respondent's expert who primarily rebutted Dr. Mikovits' testimony, was far more qualified, as a medical doctor, to provide an opinion regarding the causation of *medical disorders* in W.R., as well as to opine concerning the topics of allergy and immunology. Dr. MacGinnitie currently holds concurrent positions at the Harvard Medical School and the Children's Hospital Boston. (Ex. J, p. 1; Tr. 215-17.) He is board-certified in both pediatrics and allergy/immunology, and currently serves as a clinical director for a division at the Children's Hospital Boston -- a position that exposes him to the medical specialties of dermatology and rheumatology, in addition to his experience in allergy and immunology. (Tr. 215-16.) Approximately 90 to 95 percent of his practice is devoted to caring for children with

Frederick Harvey Whittemore close relationship with Harry Reid came under scrutiny because of perceived legislative and political pressure favors allowing Coyote Springs to overcome regulatory problems. Its total cost has been estimated at around $30 billion

Whittemore founded a research center known as the Whittemore Peterson Institute. Research began in 2006 with the opening of a small laboratory and an office on the University of Nevada, Reno campus under the direction of Judy Mikovits

Whittemore Peterson Institute filed a suit against Mikovits over her alleged possession of similar material, which included the laboratory notebooks she compiled while doing the CFS research for WPI. Mikovits, was briefly jailed on the charges.

Criminal Charges Dropped Against Chronic Fatigue Syndrome Researcher Judy Mikovits

By Jon CohenJun. 13, 2012 , 5:12 PM

Judy Mikovits, who faced a series of professional and legal woes after publishing a study in *Science* more than 2 years ago that linked chronic fatigue syndrome (CFS) to a mouse retrovirus, has had a pending criminal case against her dropped.

Last November, the district attorney in Washoe County, Nevada, filed a criminal complaint against Mikovits that charged the virologist with illegally taking computer data and related property from her former employer, the Whittemore Peterson Institute for Neuro-Immune Disease (WPI) in Reno, Nevada. In a separate civil court that month, WPI filed suit against Mikovits over her alleged possession of similar material, which included the laboratory notebooks she compiled while doing the CFS research.

On 11 June, the district attorney's office for Washoe County filed a petition to dismiss the criminal charges against Mikovits without prejudice (which means they can file a related complaint in the future), a clerk to the Justice Court of Reno told *Science*Insider.

Mikovits, who was briefly jailed on the charges, is still defending herself in the civil case, which has taken several bizarre twists, including a judge who had ruled against Mikovits recusing himself. The judge removed himself from the case because he received campaign donations from WPI co-founder Harvey Whittemore, who himself has been criminally charged with making illegal campaign contributions to a federal official. (He pled not guilty on 7 June).

Assistant District Attorney John Helzer, who filed the dismissal, says Whittemore's legal troubles factored into his decision. "There's a lot going on with the federal government and different levels that wasn't occurring when we first became involved with prosecuting this case," says Helzer. "And we have witness issues that have arisen."

Science last December retracted the 8 October 2009 CFS paper by Mikovits and co-authors, an action she opposed.

Mikovits told *Science*Insider that the only work she has been able to find has been collaborating on a large study funded by the National Institutes of Health that should be the final word on the otherwise dismissed theory that CFS is linked to a mouse retrovirus, XMRV, or its relatives. "Everyone who wanted to work with me

was deterred by the threat of litigation," Mikovits wrote in an e-mail.

The results of the large study, led by Ian Lipkin of Columbia University, are expected to be revealed in the next few weeks

"On June 17, 2013 Senate Majority Leader Harry Reid (D-NV) paid a visit to the NIH campus, where he met with NIH Director Dr. Francis S. Collins and Clinical Center Director Dr. John I. Gallin. He also met with Dr. Anthony S. Fauci, director of the National Institute of Allergy and Infectious Diseases; Dr. Gary H. Gibbons, director of the National Heart, Lung, and Blood Institute; Dr. Story C. Landis, director of the National Institute of Neurological Disorders and Stroke; and Dr. Cynthia J. Tifft, deputy clinical director of the National Human Genome Research Institute. The next day on the floor of the Senate, Reid expressed his concern about the effects of spending cuts on research efforts at NIH. "I hope we can move forward on this budget conference and get something done to set the nation's financial problems in the right direction," he said. Here Majority Leader Reid is pictured with Drs. Collins and Gallin in the North Atrium of the Clinical Center."

Harvey Whittemore's law license suspended Whittemore, a one-time influential lobbyist and land developer. He has been a licensed attorney since 1977.

- Whittemore overreached, but so does indictment

The Nevada Supreme Court has temporally suspended the law license of Reno attorney Harvey Whittemore, convicted of making an estimated $150,000 in illegal political campaign contributions to Senate Majority Leader Harry Reid.

Earlier this year, Whittemore was convicted by a federal court jury of felony crimes of making excessive political contributions, making contributions in the name of another and filing a false statement with the Federal Election Commission. He was sentenced to two years in prison starting Jan. 31, 2014 — giving him time to close his law practice — and fined $100,000.

Whittemore's attorneys have launched an appeal to the U.S. Ninth Circuit Court of Appeals, and Reid, D-Nev., has returned the money.

The court Tuesday referred the case to the Northern Nevada Disciplinary Board of the State Bar to determine the punishment for Whittemore, a one-time influential lobbyist and land developer. He has been a licensed attorney since 1977.

The court said Whittemore was convicted of three counts of serious crimes and it had the obligation to send the case to the disciplinary board to determine the extent of the punishment to be imposed, which must then be approved by the Nevada Supreme Court.

If and when he is freed from prison, Whittemore will be on two years of supervised release, requiring reporting to a probation officer, submitting to a DNA test, working regularly "at lawful occupation" and performing 100 hours of community service.

If his license is revoked, Whittemore won't be able to practice law unless the board reverses its decision.

In 1998, a similar, privately funded quest was launched by the American researcher Craig Venter, and his firm Celera Corporation or Celera Genomics.

The $300,000,000 Celera effort was intended to proceed at a faster pace and at a fraction of the cost of the "Human Genome Project" roughly $3 billion publicly funded project. The Celera approach was able to proceed at a much more rapid rate, and at a lower cost than the public project because it relied upon data made available by the publicly funded project.

In March 2000, President Clinton announced that the genome sequence could not be patented, and should be made freely available to all researchers. The statement sent Celera's stock plummeting and dragged down the biotechnology-heavy Nasdaq. The biotechnology sector lost about $50 billion in market capitalization in two days.

So let me get this straight... the project cost $3 billion and the market lost $50 billion. How much of the money lost was union pensions, I wonder?

Opps....Celera initially announced that it would seek patent protection... Hummm? Then Clinton announced that the genome sequence could not be patented.

2020-05-10-twitter-housatonic-received-dm-1198295563114029056-2.jpg

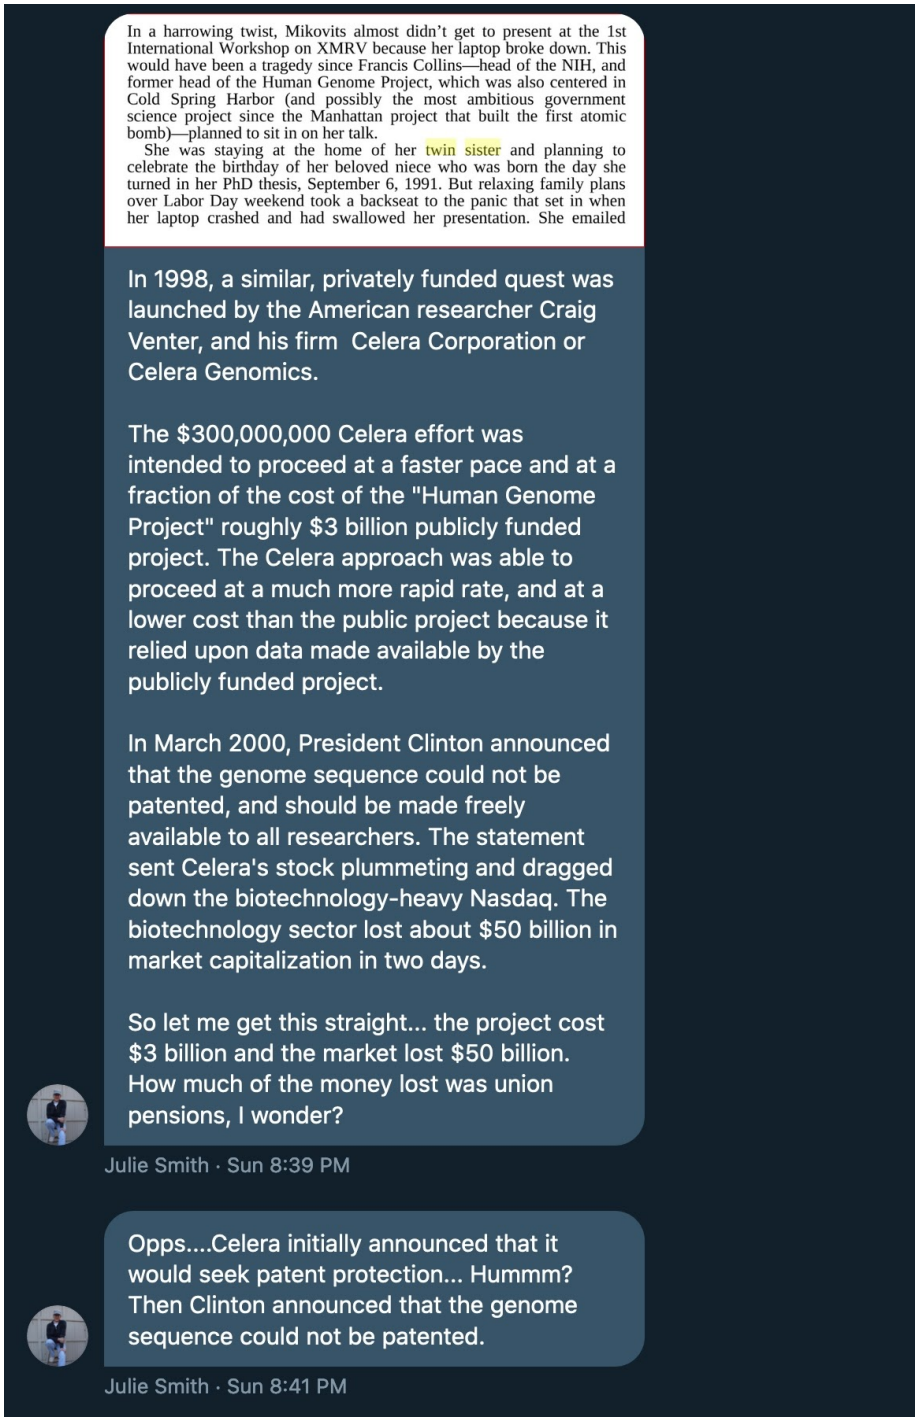
John Craig Venter was born in Salt Lake City, Utah and joined the National Institutes of Health in 1984.

In 2000, Venter and Francis Collins of the National Institutes of Health and U.S. Public Genome Project jointly made the announcement of the mapping of the human genome, a full three years ahead of the expected end of the Public Genome Program.

Venter was fired by Celera in early 2002. According to his biography, Venter was fired due to a conflict with the main investor, Tony White.

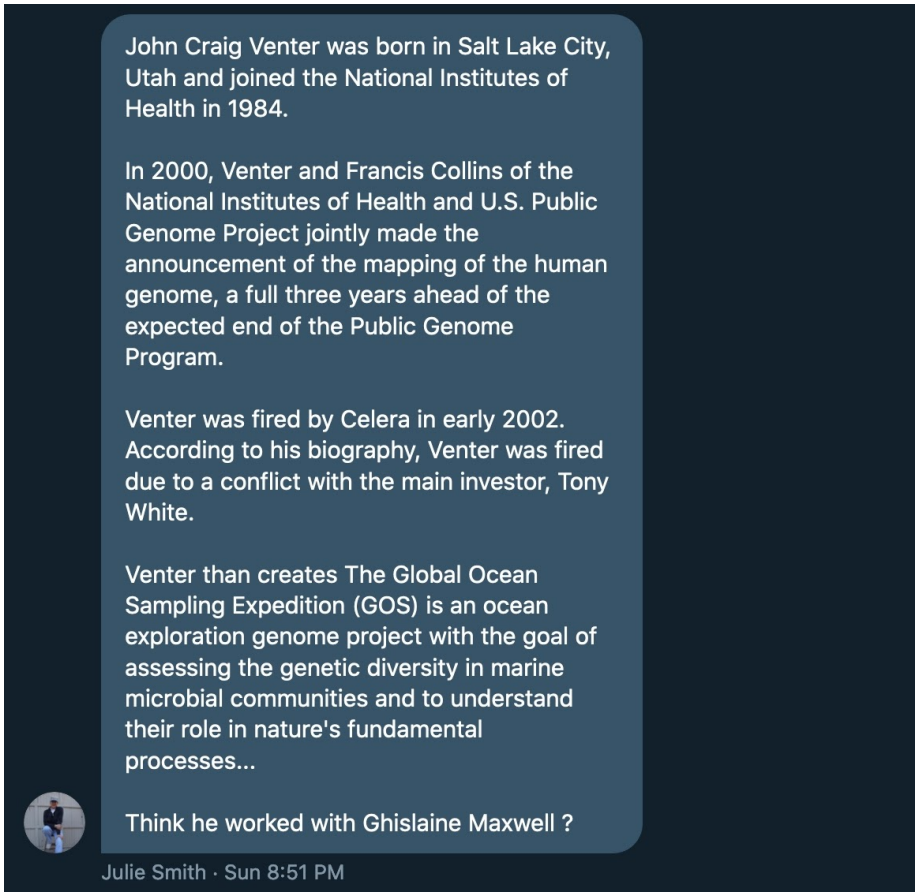
Venter than creates The Global Ocean Sampling Expedition (GOS) is an ocean exploration genome project with the goal of assessing the genetic diversity in marine microbial communities and to understand their role in nature's fundamental processes...

Think he worked with Ghislaine Maxwell ?



In a harrowing twist, Mikovits almost didn't get to present at the 1st International Workshop on XMRV because her laptop broke down. This would have been a tragedy since Francis Collins—head of the NIH, and former head of the Human Genome Project, which was also centered in Cold Spring Harbor (and possibly the most ambitious government science project since the Manhattan project that built the first atomic bomb)—planned to sit in on her talk.

She was staying at the home of her twin sister and planning to celebrate the birthday of her beloved niece who was born the day she turned in her PhD thesis, September 6, 1991. But relaxing family plans over Labor Day weekend took a backseat to the panic that set in when her laptop crashed and had swallowed her presentation. She emailed



â ğŸ“Plague,â ğŸ“ co-authored by Judy Mikovits and Kent Heckenlively, looks into the search for a link between retroviruses and chronic fatigue syndrome, autism and other conditions.

Judy Mikovits, shown with her husband, David, led breakthrough research regarding chronic fatigue syndrome that was later challenged.

2008 (June 12) - brother-in-law ? Coloner Michael Hirka Retires, June 12 2008

See [HG004F][GDrive]

[HG004G][GDrive]

Col. Michael Hirka watches Tinker Honor Guard members Capt. Vanaryda Prom, left, and Senior Airman Saleem Salahuddin begin a flag folding ceremony during the 327th Aircraft Sustainment Group commander's June 2 retirement ceremony. Officiating over the ceremony in the Tinker Club was Sue Payton, assistant secretary of the Air Force for Acquisition at the Pentagon. Ms Payton once worked for Col. Hirka in the early years of their government service. (Air Force photo by Margo Wright)

TINKER AIR FORCE BASE -- Colonel Michael Hirka retired from the Air Force on June 2.

Standing before about 100 friends and colleagues in the Tinker Club ballroom, the former 327th Aircraft Sustainment Group commander participated in several traditional rituals and listened to kind words from guest speaker and personal friend, The Honorable Sue Payton. Ms. Payton is the Assistant Secretary of the Air Force for Acquisition.

"There's a big new chapter in Colonel Hirka's book," Ms. Payton said. "It's beginning today and in the life of the Hirka family, I look on this as a great commencement because wherever it takes Mike, his wife and sons, I know that he will continue to lead with the one ultimatum that mission success is really what matters."

Colonel Hirka's Air Force career began 26 years ago when he was commissioned from Norwich University's Reserve Officer Training Corps program in Vermont. Armed with a Bachelor of Science degree in electrical engineering, the then-second lieutenant embarked on his first assignment as a satellite systems engineering analysis officer at the Air Force Satellite Control Facility at Onizuka Air Force Base in California.

Within four years, he was promoted to first lieutenant and then to captain when he was stationed in the office of the Chief of the Communications Systems Division for the Secretary of the Air Force for Special Projects at Los Angeles AFB, Calif. It was here that then-Captain Hirka met and befriended a new contractor employee, Ms. Payton.

"I met Mike Hirka 22 years ago, as he was beginning just his fourth year in the Air Force and I was beginning my first year as a contractor on the east coast representing his program office," Ms. Payton said. "He was my boss.

"I thank you for being a boss who held the standards high," Ms. Payton said. "When I go to the product centers out and about in the Air Force, I tell the folks there, 'Be a demanding customer,' and I think of Mike Hirka because you wanted to do your best for Mike Hirka, as a contractor."

After his assignment with Ms. Payton, then-Captain Hirka and Ms. Payton followed different paths but their friendship remained intact.

Captain Hirka reached the rank of Colonel in December 2004. In his 26-year career, he completed 17 assignments, many of which had an emphasis on engineering, program management, acquisitions, space, communications and logistics.

Colonel Hirka's final assignment brought him to Tinker in June 2006.

"Whether it's in space, aircraft communications or information systems, he has supported and solved some of the most complex problems at both the national and strategic level, as well as the tactical level," said Ms. Payton. "I see him as a change agent. I see him as someone who knows how to take on resistance to change no matter what area of a lifecycle of a weapons system he finds himself working in."

Colonel Hirka was honored with the Legion of Merit award, the presidential certificate of appreciation, and participated in a flag folding presentation and received several gifts from colleagues. Colonel Hirka's wife, Julie, was also honored with a certificate of public appreciation.

"When I started in 1982, I figured I'd be punching out my path, my course at the time, and in four years, I'd be on my way as an engineer doing engineering projects," Colonel Hirka said. "(But) as long as it was fun, as long as I was contributing and as long as I was still learning, (I'd) keep doing it.

"Twenty six years later, and we're still here and we're still doing it and it's been a blast," Colonel Hirka said. "I'm not thinking of this as a retirement, more as a transition to more things and different things."

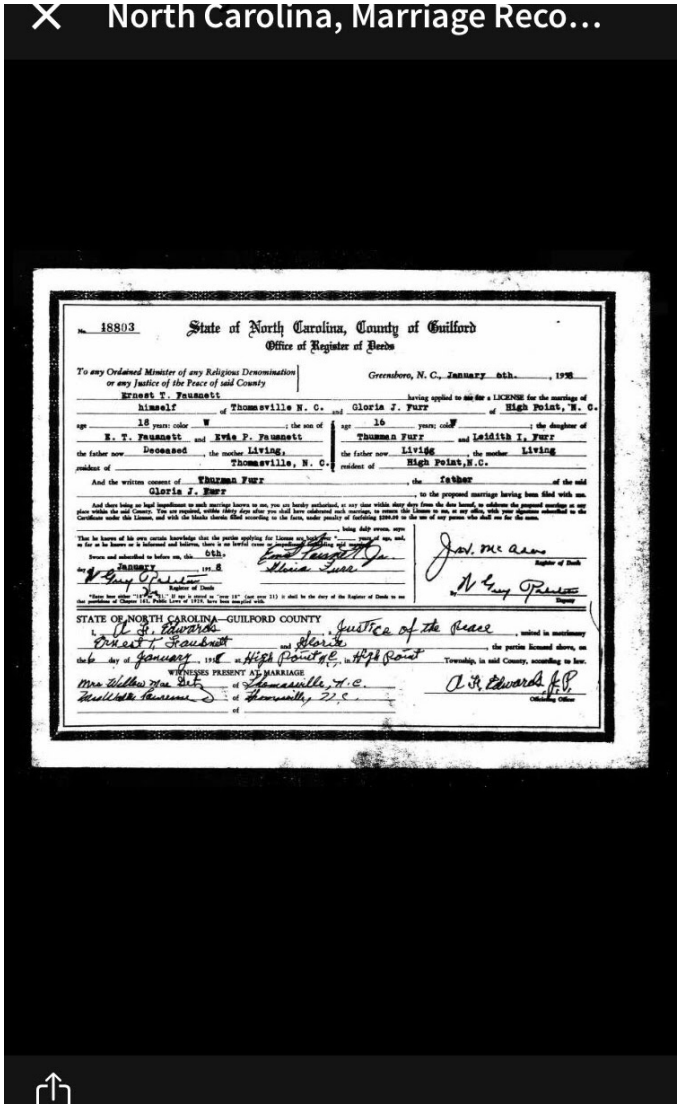
"Their mother, Gloria J Furr, appears to have been married at least 3 times. "



2019 (Jan 22) - Passing of Gloria Furr-Fornshill

PDF - at [HL003X][GDrive]

November 16, 1936 - January 22, 2019 (82 years old)

Here is Gloria Furr-Fornshill's obituary. Please accept Everhere's sincere condolences.

We are sad to announce that on January 22, 2019, at the age of 82, Gloria Furr-Fornshill (Frederick, Maryland), born in Washington, District of Columbia passed away. Family and friends are welcome to leave their condolences on this memorial page and share them with the family.

She was predeceased by : her parents, Edward M. Furr and Hazel I. Willis. She is survived by : her spouse **Kenneth B. Fornshill**; her children, **Judy Nolde** of Carlsbad, CA, **Julie Hirka** of Vienna, VA, **Karen Reid** of Dickerson, MD and **John Mikovits** of Cape Coral, FL; and her siblings, **Gary Furr** of Raleigh, NC and Jeannette Beard of Frederick, MD.. She is also survived by eight Grandchildren, three Great Grandchildren.

This document is a joint effort between JIEO, OSD, and the US Army. It is a major revision of Technical Standards for Command and Control Information Systems, ATCCIS Working Paper 25 (WP 25), Edition 3, January 1992, and of the update to the above document, IDA Paper P-2805 (Volume I and II), December 1992, prepared for JIEO. The focus remains the identification of open standards that could be used to achieve interoperability of command and control information systems (CCISs), but the document is applicable to a wide range of information systems and information technology activities. This document has had significant contributions from NATO organizations and national staffs; SHAPE; and, in the United States, the Services, JIEO, and other organizations. This document has been reorganized and extended to be aligned with the Technical Reference Model contained in Edition 2.0 of the US DoD Technical Architecture Framework for Information Management. The document places increased emphasis on the use of profiles to achieve interoperability.

COMMAND, CONTROL, COMMUNICATIONS AND INTELLIGENCE

OFFICE OF THE ASSISTANT SECRETARY OF DEFENSE

WASHINGTON, DC 20301-3040

6 May 1994

MEMORANDUM FOR DISTRIBUTION

SUBJECT: Technical Standards for Command and Control Information Systems (CCIS's) and Information Technology, IDA Paper 2959, February 1994

The Institute for Defense Analyses (IDA) has completed a review of technical standards applicable to future information technology. While the scope of the IDA effort was tactical command and control for the Year 2000 and beyond, this work has potential interest for many other types of defense information systems as well. The IDA paper provides an in-depth review of international and national, civil and military data communications and information systems standards that could be used to achieve interoperability, portability, and common operating environments. This work supports OSD efforts to promote the use of civil standards, including the Technical Architecture Framework for Information Management (TAFIM), to achieve open systems environments.

Attached is a copy of the standards analysis that has been completed under my direction by the DISA/JIEO Center for Standards and the U.S. Army. Questions and requests for additional information, including electronic copies can be directed to Dr. Robert P. Walker ((703) 845-2462 (e-mail rwalker@ida.org).

FOREWORD

The purpose of this paper is to make available substantive work done in response to a major cooperative technical support activity among agencies in the US and many NATO nations. Specifically, this paper was prepared[1] by the Institute for Defense Analyses (IDA) in support of the Supreme Headquarters Allied Powers Europe (SHAPE)-sponsored Army Tactical Command and Control Information System (ATCCIS) Phase III study effort and the Defense Information Systems Agency (DISA), Joint Interoperability and Engineering Organization (JIEO), Center for Standards. The contents of this document were reviewed and agreed to in the international ATCCIS forum, and issued by SHAPE as a NATO UNCLASSIFIED document with the same title. It was also reviewed by the Center for Standards, Directorate for DoD Standards Assistance. Comments from NATO and national commands and agencies were solicited and have been incorporated. SHAPE will be distributing this paper to all NATO nations and to those NATO commands and agencies that have expressed an interest in the ATCCIS study. Additional distributions are planned by the ATCCIS nations, NATO Headquarters (to the TSGCE), and NACISC (to the Information Systems Working Group). Background information relating to the overall ATCCIS effort is contained in the Preface to this paper.

This document is a joint effort between JIEO, OSD, and the US Army. It is a major revision of *Technical Standards for Command and Control Information Systems*, ATCCIS Working Paper 25 (WP 25), Edition 3, January 1992, and of the update to the above document, IDA Paper P-2805 (Volumes I and II), December 1992, prepared for JIEO. The focus remains the identification of open standards that could be used to achieve interoperability of command and control information systems (CCISs), but the document is applicable to a wide range of information systems and information technology activities. This document has had significant contributions from NATO organizations and national staffs; SHAPE; and, in the United States, the Services, JIEO, and other organizations.

This document has been reorganized and extended to be aligned with the Technical Reference Model contained in Edition 2.0 of the US DoD *Technical Architecture Framework for Information Management*. The document places increased emphasis on the use of profiles to achieve interoperability.

The Office of the Director of Information Systems for Command, Control, Communications and Computers (ODISC4), Headquarters Department of the Army, provides the US delegate to the ATCCIS Permanent Working Group (PWG), representing SHAPE, Allied Forces Central Europe (AFCENT), SHAPE Technical Centre, Denmark, France, Germany, the Netherlands, Spain, the United Kingdom, and the United States. Within the United States, operational issues are coordinated with the US Army Training and Doctrine Command. Technical issues are coordinated with the US Army Space and Strategic Defense Command and the US Army Communications-Electronics Command. IDA provides technical and analytical expertise in support of the US contributions to the overall ATCCIS effort. ODISC4 also furnishes the U.S.

---

1 This document was prepared in response to requests from the Office of the Assistant Secretary of Defense (C3I), Theater and Tactical Command, Control, and Communications under Contract MDA903-89-C-0003, Task Order T-J1-246, and the Joint Interoperability and Engineering Organization (JIEO), Defense Information Systems Agency (DISA), Task Order T-S5-1211. Funding for Task T-J1-246 was provided by the US Army Office of the Director of Information Systems for Command, Control, Computers, and Communications (DISC4).

FURR, HAZEL IRENE

On Monday, February 24, 2003 at INOVA Fairfax Hospital. HAZEL IRENE FURR of Falls Church. Beloved wife of the late Edward M. Furr; dear mother of Jeannette C. Beard, Gloria Furr Fornshill, and Gary E. Furr. She is also survived by nine grandchildren and 13 great grandchildren. The family will receive friends at the EVERLY COMMUNITY FUNERAL CARE, 6161 Leesburg Pike, Falls Church, VA on Friday, February 28, from 6 to 8 p.m. where services will be held on Saturday, March 1, at 10 a.m. Interment Cedar Hill Cemetery, Suitland, MD.

The HHV-6 Foundation

About us page : (Source : [HI0019][GDrive])

The HHV-6 Foundation is a non-profit institution that encourages scientific exchange between investigators by holding conferences for virologists and clinical researchers, maintaining a repository of reagents to facilitate research, and offering pilot grants for promising research projects.

The Foundation also seeks to raise awareness among physicians of the many conditions that have recently been associated with HHV-6 infection and encourage the discovery of antiviral compounds appropriate for HHV-6. The Foundation pilot grants allow investigators the seed funds to gather preliminary data in order to apply for larger grants.

The Scientific Director is **Dharam Ablashi, co-discoverer of the HHV-6 virus and a 23-year veteran of the National Cancer Institute**. Ablashi is also the co-founder of the EBV Association and the IACFS. **Kristin Loomis** has served as the Executive Director since founding the organization in 2004 with the help of several other family members and patients who have suffered from HHV-6 associated central nervous system disease. The Scientific Advisory Board is comprised of many of the world's top experts on HHV-6.

Jill Chase manages the Foundation's Repository as well as many of the research projects initiated by the Foundation. Josh Pritchett writes the newsletters and assists with the web site updates. Emily Lum is a research assistant.

Louise Chatlynne and Courtney de Balmann volunteer their time to assist the Foundation on important research projects.

The Foundation sponsors a large international conference every other year.

Born

Michael Robert Milken

July 4, 1946 (age 74)

Encino, California, U.S.

Citizenship

United States

Education

University of California, Berkeley (BS)

University of Pennsylvania (MBA)

Occupation

Businessman, financier, philanthropist

Known for

Developing the High-yield bond market, Indictment for securities fraud, philanthropy

Net worth

US$3.7 billion

(March 2020)[1]

Criminal status

Released

Pardoned (February 18, 2020)[2]

Spouse(s)

Lori Anne Hackel (m. 1968)

Children

3

Relatives

Lowell Milken (brother)

Conviction(s)

Securities and reporting violations (1989)

Criminal charge

Racketeering, securities fraud, etc.

Penalty

22 months imprisonment (actual time served)

$600 million fine

Michael Robert Milken (born July 4, 1946) is an American convicted felon, financier and philanthropist. He is noted for his role in the development of the market for high-yield bonds ("junk bonds"),[3] and his conviction and sentence following a guilty plea on felony charges for violating U.S. securities laws.[4] Since his release from prison, he has also become known for his charitable giving.[5][6][7] Milken was pardoned by President Donald Trump on February 18, 2020.

Milken was indicted for racketeering and securities fraud in 1989 in an insider trading investigation. As the result of a plea bargain, he pleaded guilty to securities and reporting violations but not to racketeering or insider trading. Milken was sentenced to ten years in prison, fined $600 million, and permanently barred from the securities industry by the Securities and Exchange Commission. His sentence was later reduced to two years for cooperating with testimony against his former colleagues and for good behavior.[8] Since his release from prison, Milken has funded medical research.[9]

He is co-founder of the Milken Family Foundation, chairman of the Milken Institute, and founder of medical philanthropies funding research into melanoma, cancer and other life-threatening diseases. A prostate cancer survivor, Milken has devoted significant resources to research on the disease.[10] In a November 2004 cover article, *Fortune* magazine called him "The Man Who Changed Medicine" for changes in approach to funding and results that he initiated.[9] Milken's compensation while head of the high-yield bond department at Drexel Burnham Lambert in the late 1980s exceeded $1 billion over a four-year period, a record for U.S. income at that time.[11] With an estimated net worth of around $3.7 billion as of 2018, he is ranked by *Forbes* magazine as the 606th richest person in the world.[1][12]

Education[edit]

Milken was born into a middle-class Jewish[13][14] family in Encino, California.[15]

He graduated from Birmingham High School where he was the head cheerleader and worked while in school at a diner.[16] His classmates included future Disney president Michael Ovitz[17] and actresses Sally Field and Cindy Williams. In 1968, he graduated from the University of California, Berkeley with a B.S. with highest honors where he was elected to Phi Beta Kappa and was a member of the Sigma Alpha Mu fraternity.[18] He received his MBA from the Wharton School of the University of Pennsylvania. While at Berkeley, Milken was influenced by credit studies authored by W. Braddock Hickman, a former president of the Federal Reserve Bank of Cleveland, who noted that a portfolio of non-investment grade bonds offered "risk-adjusted" returns greater than that of an investment-grade portfolio.

Career[edit]

Through his Wharton professors, Milken landed a summer job at Drexel Harriman Ripley, an old-line investment bank, in 1969. After completing his MBA, he joined Drexel (by then known as Drexel Firestone) as director of low-grade bond research. He was also given control of some capital and permitted to trade. Over the next 17 years, he had only four down months.[12]

Drexel merged with Burnham and Company in 1973 to form Drexel Burnham. Despite the firm's name, Burnham was the nominal survivor; the Drexel name came first only at the insistence of the more powerful investment banks, whose blessing was necessary for the merged firm to inherit Drexel's position as a "major" firm.

Milken was one of the few prominent holdovers from the Drexel side of the merger, and became the merged firm's head of convertibles. He persuaded his new boss, fellow Wharton alumnus Tubby Burnham, to let him start a high-yield bond trading department—an operation that soon earned a 100 percent return on investment.[12] By 1976, Milken's income at what was now Drexel Burnham Lambert was estimated at $5 million a year. In 1978, Milken moved the high-yield bond operation to Century City in Los Angeles.[19][20][21]

High-yield bonds and leveraged buyouts[edit]

By the mid-1980s, Milken's network of high-yield bond buyers (notably Fred Carr's Executive Life Insurance Company and Tom Spiegel's Columbia Savings & Loan) had reached a size that enabled him to raise large amounts of money quickly.

This money-raising ability also facilitated the activities of leveraged buyout (LBO) firms such as Kohlberg Kravis Roberts and of the so-called "greenmailers". Most of them were armed with a "highly confident letter" from Drexel, a tool Drexel's corporate finance wing crafted that promised to raise the necessary debt in time to fulfill the buyer's obligations. It carried no legal status, but by this time, Milken had a reputation for being able to make markets for any bonds that he underwrote. For this reason, "highly confident letters" were considered to reliably demonstrate capacity to pay.[22][23] Supporters, like George Gilder in his book, *Telecosm* (2000), state that Milken was "a key source of the organizational changes that have impelled economic growth over the last twenty years. Most striking was the productivity surge in capital, as Milken ... and others took the vast sums trapped in old-line businesses and put them back into the markets."[24]

Amongst his significant detractors have been Martin Fridson formerly of Merrill Lynch and author Ben Stein. Milken's high-yield "pioneer" status has proved dubious as studies show "original issue" high-yield issues were common during and after the Great Depression. Milken himself points out that high-yield bonds go back hundreds of years, having been issued by the Massachusetts Bay Colony in the 17th century and by America's first Treasury Secretary Alexander Hamilton. Others such as Stanford Phelps, an early co-associate and rival at Drexel, have also contested his credit as having pioneered the modern high-yield market.[*citation needed*]

Despite his influence in the financial world during the 1980s (at least one source called him the most powerful American financier since J. P. Morgan),[25] Milken was an intensely private man who shunned publicity; he reportedly owned almost all photographs taken of him.[12][17]

Later career[edit]

Milken and his brother Lowell founded Knowledge Universe in 1996, as well as Knowledge Learning Corporation (KLC), the parent company of KinderCare Learning Centers, the largest for-profit child care provider in the country. Michael Milken used to be chairman of Knowledge Universe, until it was sold in 2015.[26][27]

He established K12 Inc., a publicly traded education management organization (EMO) that provides online schooling, including to charter school students, for whom services are paid by tax dollars,[28] which is the largest EMO in terms of enrollment.[29]

Milken in 2018

Scandal[edit]

Dan Stone, a former Drexel executive, wrote in his book *April Fools* that Milken was under nearly constant scrutiny from the Securities and Exchange Commission from 1979 onward due to unethical and sometimes illegal behavior in the high-yield department.[25]

Milken's role in such behavior has been much debated. Stone claims that Milken viewed the securities laws, rules and regulations with a degree of contempt, feeling

Milken's role in such behavior has been much debated. Stone claims that Milken viewed the securities laws, rules and regulations with a degree of contempt, feeling they hindered the free flow of trade. However, Stone said that while Milken condoned questionable and illegal acts by his colleagues, Milken himself personally followed the rules.[25] He often called Drexel's president and CEO, Fred Joseph—known for his strict view of the securities laws—with ethical questions.[12]

On the other hand, several of the sources James B. Stewart used for *Den of Thieves* told him that Milken often tried to get as much as five times the maximum markup on trades than was permitted at the time.[30]

Harvey A. Silverglate, a prominent defense attorney who represented Milken during the appellate process, disputes that view in his book *Three Felonies a Day*: "Milken's biggest problem was that some of his most ingenious but entirely lawful maneuvers were viewed, by those who initially did not understand them, as felonious, precisely because they were novel – and often extremely profitable."[31]

Ivan Boesky and an intensifying investigation[edit]

The SEC inquiries never got beyond the investigation phase until 1986, when arbitrageur Ivan Boesky pleaded guilty to securities fraud as part of a larger insider trading investigation. As part of his plea, Boesky implicated Milken in several illegal transactions, including insider trading, stock manipulation, fraud and stock parking (buying stocks for the benefit of another). This led to an SEC probe of Drexel, as well as a separate criminal probe by Rudy Giuliani, then United States Attorney for the Southern District of New York. Although both investigations were almost entirely focused on Milken's department, Milken refused to talk with Drexel (which launched its own internal investigation) except through his lawyers.[12][25] It turned out that Milken's legal team believed Drexel would be forced to cooperate with the government at some point, believing that a securities firm would not survive the bad publicity of a long criminal and SEC probe.[30]

For two years, Drexel insisted that nothing illegal occurred, even when the SEC sued Drexel in 1988. Later that year, Giuliani began considering an indictment of Drexel under the powerful Racketeer Influenced and Corrupt Organizations Act. Drexel management immediately began plea bargain talks, concluding that a financial institution could not possibly survive a RICO indictment. However, talks collapsed on December 19, when Giuliani made several demands that Drexel found too harsh, including one that Milken leave the firm if indicted.[25]

Only a day later, however, Drexel lawyers discovered suspicious activity in one of the limited partnerships Milken set up to allow members of his department to make their own investments. That entity, MacPherson Partners, had acquired several warrants for the stock of Storer Broadcasting in 1985. At the time, Kohlberg Kravis Roberts was in the midst of a leveraged buyout of Storer, and Drexel was lead underwriter for the bonds being issued. One of Drexel's other clients bought several Storer warrants and sold them back to the high-yield bond department. The department in turn sold them to MacPherson. This partnership included Milken, other Drexel executives, and a few Drexel customers. However, it also included several managers of money market funds who had worked with Milken in the past. It appeared that the money managers bought the warrants for themselves and did not offer the same opportunity to the funds they managed.[25] Some of Milken's children also received warrants, according to Stewart, raising the appearance of Milken self-dealing.[30]

However, the warrants to money managers were especially problematic. At the very least, Milken's actions were a serious breach of Drexel's internal regulations, and the money managers had breached their fiduciary duty to their clients. At worst, the warrants could have been construed as bribes to the money managers to influence decisions they made for their funds.[30]

Indeed, several money managers were eventually convicted on bribery charges.[32] The discovery of MacPherson Partners—whose very existence had not been known to the public at the time—seriously eroded Milken's credibility with the board. On December 21, 1988, Drexel entered a guilty plea to six counts of stock parking and stock manipulation. Drexel said it "was not in a position to dispute" the allegations made by the government. As part of the deal, Drexel agreed that Milken had to leave the firm if indicted.[12][25]

Indictment and sentencing[edit]

In March 1989, a federal grand jury indicted Milken on 98 counts of racketeering and fraud. The indictment accused Milken of a litany of misconduct, including insider trading, stock parking (concealing the real owner of a stock), tax evasion and numerous instances of repayment of illicit profits. One charge was that Boesky paid Drexel $5.3 million in 1986 for Milken's share of profits from illegal trading. This payment was represented as a consulting fee to Drexel. Shortly afterward, Milken resigned from Drexel and formed his own firm, International Capital Access Group.[12][25]

On April 24, 1990, Milken pleaded guilty to six counts of securities and tax violations.[1] Three of them involved dealings with Boesky to conceal the real owner of a stock:[31]

- Aiding and abetting another person's failure to file an accurate 13d statement with the SEC, since the schedule was not amended to reflect an understanding that any loss would be made up
- Sending confirmation slips through the mail that failed to disclose that a commission was included in the price
- Aiding and abetting another in filing inaccurate broker-dealer reports with the SEC

Two other counts were related to tax evasion in transactions Milken carried out for a client of the firm, David Solomon, a fund manager[31]

- Selling stock without disclosure of an understanding that the purchaser would not lose money
- Agreeing to sell securities to a customer and to buy those securities back at a real loss to the customer, but with an understanding that he would try to find a future profitable transaction to make up for any losses

The last count was for conspiracy to commit these five violations.

As part of his plea, Milken agreed to pay $200 million in fines. At the same time, he agreed to a settlement with the SEC in which he paid $400 million to investors who had been hurt by his actions. He also accepted a lifetime ban from any involvement in the securities industry. In a related civil lawsuit against Drexel he agreed to pay $500 million to Drexel's investors.[33][34]

Critics of the government charge that the government indicted Milken's brother Lowell to pressure Milken to settle, a tactic some legal scholars condemn as unethical. "I am troubled by - and other scholars are troubled by - the notion of putting relatives on the bargaining table," said Vivian Berger, a professor at Columbia University Law School, in a 1990 interview with *The New York Times*.[35] As part of the deal, the case against Lowell was dropped. Federal investigators also questioned some of Milken's relatives about their investments.[12]

At Milken's sentencing, Judge Kimba Wood told him:

> You were willing to commit only crimes that were unlikely to be detected. ... When a man of your power in the financial world ... repeatedly conspires to violate, and violates, securities and tax business in order to achieve more power and wealth for himself ... a significant prison term is required.[30]

In statements to a parole board in 1991, Judge Wood estimated that the "total loss from Milken's crimes" was $318,000, less than the government's estimate of $4.7 million and she recommended that he be eligible for parole in three years.[36] Milken's sentence was later reduced to two years from ten; he served 22 months.[37][38]

Attempts to secure presidential pardon[edit]

In June 2018 it was reported that some of president Donald Trump's advisers, including Rudy Giuliani, the onetime federal prosecutor whose criminal investigation led to Milken's conviction, were urging the president to pardon Milken. Milken's attempts to secure a presidential pardon have spanned multiple administrations.[39]

On February 18, 2020, Trump granted clemency to Milken.[40][41] However, his previous trading license which he lost following his conviction still remained void, and he would still have to reapply and obtain a new trading license in order to return to trading securities.[42]

2013 SEC investigation[edit]

In February 2013, the SEC announced that they were investigating whether Milken violated his lifetime ban from the securities industry. The investigation revolved around Milken allegedly providing investment advice through Guggenheim Partners.[43]

Since 2011, the SEC has been investigating Guggenheim's relationship with Milken.[44]

Philanthropy[edit]

Milken lecturing on "PayPal and the poor", 2019

Upon his release from prison in 1993, Milken founded the Prostate Cancer Foundation for prostate cancer research, which by 2010 was "the largest philanthropic source of funds for research into prostate cancer".[45] Milken himself was diagnosed with advanced prostate cancer in the same month he was released.[46] His cancer is currently in remission. The Prostate Cancer Foundation works closely with Major League Baseball through its Home Run Challenge program to promote awareness of prostate cancer and raise money for medical research. Each season in the weeks leading up to Father's Day, Milken visits many ballparks and appears on TV and radio broadcasts during the games.

In 2003, Milken launched a Washington, D.C.-based think tank called FasterCures, which seeks greater efficiency in researching all serious diseases. Key initiatives of FasterCures are TRAIN, Partnering for Cures and the Philanthropy Advisory Service.[46]

Fortune magazine called Milken "The Man Who Changed Medicine" in a 2004 cover story on his philanthropy.[9]

In September 2012, Milken and the director of the National Institutes of Health, Dr. Francis Collins, jointly hosted 1,000 senior medical scientists, patients, activists, philanthropists, regulators, and members of Congress at a three-day conference[47] to demonstrate the return on investment in medical research.

On March 11, 2014, President Steven Knapp of George Washington University in Washington, D.C. announced the university was renaming its public health school after Milken as a result of a total of $80 million in gifts, $50 million from the Milken Institute and the Milken Family Foundation and $30 million gift from Viacom chairman Sumner Redstone. These gifts are designated to research and scholarship on public health issues.[48]

In popular culture[edit]

Milken became the first recipient of the Ig Nobel Economics Prize in 1991.[49][50][51]

Ayad Akhtar's play, *Junk*, set during the bond trading scandals of the 1980s, is partly based on Milken's "fall from grace". Milken is the inspiration for the main character in the play.[52]

Personal life[edit]

Milken is married to Lori Anne Hackel, whom he had dated in high school.[53] They have three children.[54] He reportedly follows a vegetarian-like diet rich in fruits and vegetables for its presumed health benefits and has co-authored a vegan cookbook with Beth Ginsberg.[55][56]

2019 (Oct 26) - NY Times : "Symbol of ’80s Greed Stands to Profit From Trump Tax Break for Poor Areas"

RENO, Nev. — In the 1980s, Michael Milken embodied Wall Street greed. A swashbuckling financier, he was charged with playing a central role in a vast insider-trading scheme and was sent to prison for violating federal securities and tax laws. He was an inspiration for the Gordon Gekko character in the film “Wall Street.”

Mr. Milken has spent the intervening decades trying to rehabilitate his reputation through an influential nonprofit think tank, the Milken Institute, devoted to initiatives "that advance prosperity."

These days, the Milken Institute is a leading proponent of a new federal tax break that was intended to coax wealthy investors to plow money into distressed communities known as "opportunity zones." The institute's leaders have helped push senior officials in the Trump administration to make the tax incentive more generous, even though it is under fire for being slanted toward the wealthy.

Mr. Milken, it turns out, is in a position to personally gain from some of the changes that his institute has urged the Trump administration to enact. In one case, the Treasury secretary, Steven Mnuchin, directly intervened in a way that benefited Mr. Milken, his longtime friend.

It is a vivid illustration of the power that Mr. Milken, who was barred from the securities industry and fined $600 million as part of his 1990 felony conviction, has amassed in President Trump's Washington. In addition to the favorable tax-policy changes, some of Mr. Trump's closest advisers — including Mr. Mnuchin, Jared Kushner and Rudolph W. Giuliani — have lobbied the president to pardon Mr. Milken for his crimes, or supported that effort, according to people familiar with the effort.

While the Milken Institute's advocacy of opportunity zones is public, Mr. Milken's financial stake in the outcome is not.

The former "junk bond king" has investments in at least two major real estate projects inside federally designated opportunity zones in Nevada, near Mr. Milken's Lake Tahoe vacation home, according to public records reviewed by The New York Times.

One of those developments, inside an industrial park, is a nearly 700-acre site in which Mr. Milken is a major investor. Last year, after pressure from Mr. Milken's business partner and other landowners, the Treasury Department ignored its own guidelines on how to select opportunity zones and made the area eligible for the tax break, according to people involved in the discussions and records reviewed by The Times.

The unusual decision was made at the personal instruction of Mr. Mnuchin, according to internal Treasury Department emails. It came shortly after he had spent time with Mr. Milken at an event his institute hosted.

"People were troubled," said Annie Donovan, who previously ran the Treasury office in charge of designating areas as opportunity zones. She and two of her former colleagues said they were upset that the Treasury secretary was intervening to bend rules, though they said they didn't realize at the time that Mr. Mnuchin's friend stood to profit. The agency's employees, Ms. Donovan said, "were put in a position where they had to compromise the integrity of the process."

The opportunity zone initiative, tucked into the tax cut bill that Mr. Trump signed into law in 2017, has become one of the White House's signature initiatives. It allows investors to delay or avoid taxes on capital gains by putting money in projects or companies in more than 8,700 federally designated opportunity zones. Mr. Trump has boasted that it will revitalize downtrodden neighborhoods.

But the incentive, also championed by some prominent Democrats, has been dogged by criticism that it is a gift to wealthy investors and real estate developers. From the start, the tax break targeted people with capital gains, the vast majority of which are held by the very richest investors. The Treasury permitted opportunity zones to encompass not only poor communities but some adjacent affluent neighborhoods. Much of the money so far has flowed to those wealthier areas, including many projects that were planned long before the new law was enacted.

Investors and others — including Mr. Milken's institute — have been pushing the Treasury Department to write the rules governing opportunity zones in ways that would make it easier to qualify for the tax break. That campaign worked, and Mr. Milken is among the potential beneficiaries.

Geoffrey Moore, a spokesman for Mr. Milken, confirmed that Mr. Milken had investments inside opportunity zones, though they are a sliver of his overall real estate holdings. He disputed that Mr. Milken had used his institute or Washington connections to benefit his investments and said no one at the institute "has any specific knowledge of Mike's personal investments."

Mr. Moore added that Mr. Milken's support for opportunity zones was based on his longstanding belief "that jobs and the democratization of ownership are the keys to helping people in economically struggling areas."

A spokesman for the Milken Institute, Geoffrey Baum, said that "to suggest that the work of the Milken Institute is motivated by or connected to Mr. Milken's investments is flat-out wrong." He said the institute advocated changes that were intended to spread the benefits to more low-income communities, not to help the wealthy.

The White House declined to comment on whether Mr. Trump is considering a presidential pardon for Mr. Milken.

A Notorious Symbol

ImageMr. Milken at the New York offices of Drexel Burnham Lambert in 1978.

Mr. Milken — operating from an X-shaped trading desk in Beverly Hills, Calif. — was a Wall Street legend. He pioneered the junk bond, which enabled financially risky companies to borrow billions of dollars and ignited a wave of often-hostile corporate takeovers that came to define a go-go era. His firm, Drexel Burnham Lambert, hosted an annual event, which came to be known as the Predators' Ball, where the era's greatest financiers mingled. Mr. Milken became a billionaire.

Then, in 1989, federal prosecutors charged him with violating securities and tax laws and with being part of a lucrative insider-trading ring. The next year, Drexel Burnham went bankrupt.

Mr. Milken pleaded guilty and was sentenced to 10 years in prison and paid $600 million in fines. After cooperating with the government, he ended up serving about two years behind bars.

Mr. Milken emerged with a considerable fortune intact. He invested in companies in for-profit education, health care and fast food, according to securities filings and company announcements. He also acquired lots of real estate, coming to own roughly 700 properties around the United States, Mr. Moore said.

He continued to attract scrutiny from regulators, including one case in which Mr. Milken paid $47 million to resolve the Securities and Exchange

He continued to attract scrutiny from regulators, including one case in which Mr. Milken paid $47 million to resolve the Securities and Exchange Commission's allegations that he had violated his lifetime ban from the securities industry.

Mr. Milken, however, has largely managed to restore his reputation — and his clout. His family gave tens of millions of dollars to his Milken Institute, which he founded in 1991 and whose board of directors he leads. After battling prostate cancer, he helped raise hundreds of millions of dollars to fund cancer research.

Sign Up

In Washington, Mr. Milken, 73, and his institute have courted influence, wooing and sometimes adding former federal officials. His family recently spent more than $85 million to buy three buildings opposite the White House and the Treasury Department, which he is transforming into his institute's new Washington offices.

The most public display of his renewed stature comes each spring in Los Angeles when Mr. Milken presides over a glitzy gathering at the Beverly Hilton — the same venue where his famed Predators' Balls took place three decades ago.

The Milken Institute's annual conference attracts thousands of the world's most powerful people — from government, finance, medicine, Hollywood and the like — for a frenzy of high-powered networking and conspicuous consumption. Recent guests have included Leon Black, the chairman of Apollo Global Management; David M. Solomon, the chief executive of Goldman Sachs; Eric Schmidt, the former chief executive of Google; and the New England Patriots quarterback Tom Brady.

Mr. Milken is the power broker at the center of the action. Onstage, he interviews famous guests. In private, he organizes exclusive dinners. Some have called the event the Davos of North America.

In the Trump era, cabinet secretaries and White House advisers have been among the event's marquee guests, more so than in other recent administrations. Coveted speaking roles have gone to Ivanka Trump and her husband, Mr. Kushner, giving them access to an elite audience.

Shaping the Rules of the Road

Image

At last year's event in Beverly Hills, attendees included Commerce Secretary Wilbur Ross and Mr. Mnuchin. The Treasury secretary was accompanied by several senior aides, including Daniel Kowalski, who is overseeing the department's drafting of the opportunity zone rules.

Mr. Kowalski, who has spent months drumming up support across the country for opportunity zones, is well acquainted with the Milken Institute.

After the tax incentive became law, it was up to the Treasury, and Mr. Kowalski in particular, to put it in effect through a series of rules. Officials at the Milken Institute met repeatedly with him to try to influence that rule-writing process. The institute submitted a series of letters and presentations to the Treasury and the Internal Revenue Service, and at times directly to Mr. Mnuchin, pushing for rules that would make the tax break easier to qualify for.

"Helping to shape the rules of the road" is how the Milken Institute describes its work on opportunity zones.

The institute "is incredibly active," Mr. Kowalski said in an interview. He said he thought he had discussed opportunity zones with Mr. Milken, although he said he could not specifically recall. He disputed that Mr. Milken or his institute exerted any special influence over the Treasury Department.

Image

Among the Milken Institute's proposals was for the Treasury to give investors a generous amount of time to build on opportunity zone land and to reduce the amount that investors had to spend upgrading properties to be eligible for the tax break. Those changes would make it easier for investors to reap the benefits.

The institute also asked the Treasury a question that would clarify if investors who owned land in opportunity zones before the tax law was passed were eligible to receive the benefits. The Treasury ruled that such investments were permissible, a controversial decision since the purpose of the opportunity zone initiative was to spur new investments, not reward existing projects.

Mr. Milken's spokesman, Mr. Moore, said Mr. Milken "never attended any meeting focused on opportunity zone regulations with any federal agency, nor did he consult with any institute representatives who may have interacted with any agency."

But Aron Betru, who led the Milken Institute's opportunity zone efforts, told The Times in an interview that he did discuss opportunity zones with Mr. Milken, though he said he was not aware of Mr. Milken's specific investments. And in 2018 Mr. Mnuchin and Mr. Milken attended a small, private event, sponsored by the institute, to discuss opportunity zones.

Boomtown

Image

Mr. Milken is an investor in 700 acres in an industrial park in Nevada. The park didn't qualify for opportunity zone status until Mr. Mnuchin told Treasury officials that they should accept the nomination of the census tract it is in.

High above Reno, on a vast hillside where wild horses roam, is the site of one of Nevada's biggest opportunity zones.

The center of this area is known as Comstock Meadows, a reference to the 1859 discovery of the so-called Comstock Lode, one of the largest deposits of silver ever found in the United States. The find generated hundreds of millions of dollars in wealth, creating a boomtown in nearby Virginia City.

Today it is home to the Tahoe-Reno Industrial Center. Lured by cheap land, Google is building a huge new complex inside the industrial park. Tesla and Switch, the data-center company, recently opened their own operations. And down the street, Mr. Milken co-owns a company that holds nearly 700 acres of empty land.

He and his partner — Chip Bowlby, president of a development company called Reno Land — planned to use that space to open a so-called tech incubator, where smaller companies could set up operations, among other possible uses.

Being inside an opportunity zone would potentially be a huge boon for the venture. It would mean that start-ups at the tech incubator could attract tax-advantaged money from outside investors.

Nevada officials wanted to nominate the census tract that included the industrial park as an opportunity zone. But in early 2018, Treasury officials had ruled that the area was ineligible because its residents were too affluent.

Major landowners at the site, including Mr. Bowlby, urged state and local officials to try to get the Treasury to reverse that ruling, said Kris Thompson, the project manager at the industrial center.

Storey County, where the industrial park is situated, deployed Jon Porter, a former House Republican from Nevada who is now a lobbyist, to push the matter. Dean Heller, at the time a Republican senator, and Brian Sandoval, then the governor, also were enlisted and had phone calls with Mr. Mnuchin around that time, according to Treasury records. Mr. Heller, Mr. Porter and Mr. Sandoval did not respond to requests for comment.

'My L.A. Friends'

Image

Mr. Milken at the Milken Institute Global Conference in April this year.

Just as that lobbying intensified in the spring of 2018, Mr. Milken opened his institute's annual conference in Beverly Hills.

Mr. Mnuchin was a featured guest. "It's great to be here with you and all my L.A. friends," the Treasury secretary said in an onstage interview on April 30.

That afternoon, the institute organized an invitation-only meeting with Mr. Mnuchin and his staff to discuss opportunity zones. Other listed attendees included Sean Parker, the former Facebook president and an early advocate of opportunity zones, and Raymond J. McGuire, a top Citigroup executive. Mr. Betru was the moderator.

Within days, the Treasury Department had shifted its position and was now willing to let the state nominate the area around the Nevada industrial park as an opportunity zone.

Mr. Mnuchin told Mr. Kowalski to inform other Treasury officials that they should accept Storey County's nomination, according to email records reviewed by The Times.

Image

Mr. Mnuchin spoke on the phone on May 8 with Mr. Sandoval. Forty-five minutes later, Mr. Sandoval formally nominated the site to be part of an opportunity zone, email records, including documents from Nevada, show. And the decision was soon officially blessed by the Treasury Department. (While the Treasury's reversal has been reported, Mr. Milken's connection has not been previously disclosed.)

Treasury officials said the change was part of an effort to iron out inconsistencies in different Treasury rules. But the switch provoked intense protests from Treasury and I.R.S. employees.

"Failure to apply the designation standards equally across the board will call into question the legitimacy of the process by which the designations were made," an unnamed I.R.S. employee wrote in an internal memo in May 2018. It added that the appearance of "arbitrary" Treasury standards risked "opening the door for accusations that the determination process was influenced by political considerations or bias."

"Any such controversy would in turn taint the opportunity zones and potentially chill or cloud the incentive for investors to invest in the opportunity zones," the memo said.

In an interview this month at an event co-sponsored by the Milken Institute in Jackson, Miss., Mr. Kowalski would not comment on whether Mr. Mnuchin had been the driving force behind the Treasury's reversal. "I can certainly say he was apprised of the situation," Mr. Kowalski said.

Brett Theodos, a senior fellow at the Urban Institute, which has advised state governments including Nevada on their nominations of opportunity zones, said the Treasury's decision-making appeared problematic. "Making exceptions for the politically connected is deeply troubling," he said.

Spokesmen for Mr. Milken and Mr. Mnuchin said the two men had never discussed the Storey County issue. Mr. Mnuchin's spokesman, Devin O'Malley, said Mr. Mnuchin "had no knowledge of Milken's investments in Nevada."

Wins for Milken

Image

Mr. Milken is an investor in this housing, retail and hotel development being built in Reno. It's in an opportunity zone.Credit...Tiffany Brown Anderson for The New York Times

In August 2018, Mr. Mnuchin and Mr. Milken met again. This time, the occasion was a small conference hosted by the Milken Institute to discuss opportunity zones. The event took place at the Hamptons home of the real estate developer Richard LeFrak, a friend of and donor to Mr. Trump, according to the event's agenda.

A handout from the event, which was obtained by The Times, showed that Mr. Milken's institute had lobbied the Treasury Department on opportunity zones.

A handout from the event, which was later posted online, showed a map of all 8,764 opportunity zones in the United States, but focused on the virtues of just one specific area: Reno. The handout promoted the city as a “hub to the western United States.”

The handout did not mention that Mr. Milken was a major investor in two projects in opportunity zones in that area: the tech incubator in the industrial park and a housing, hotel and retail development on the site of an old shopping mall in Reno.

As his institute was continuing to push the Treasury to tinker with its opportunity zone rules, Mr. Milken gave Mr. Mnuchin a flight in January on his private jet to Los Angeles, where both men have homes.

Three months later, the Treasury Department heeded the institute’s request and clarified that investors could receive the opportunity zone tax benefits by simply leasing properties to themselves. As a result, investors who had long owned land inside opportunity zones were now eligible for the tax break.

In a separate round of rule changes, Treasury agreed to loosen rules governing how quickly developers had to start work on opportunity zone projects and how much money they had to spend — both revisions that the Milken Institute, among many others, had sought.

This was a potential win for Mr. Milken. His partner, Mr. Bowlby, had bought the Nevada real estate — for both the tech incubator and the residential and retail complex — before the areas were designated as opportunity zones.

Mr. Bowlby, who didn’t respond to requests for comment, said at a public event this year that he was using a lease on his Reno project with Mr. Milken “so we can still be qualified for the opportunity zone.”

The Treasury’s leasing decision has faced criticism.

“Anybody who owned property in the zone prior to 2018 would have been out of luck until these rules,” said Michelle Layser, a tax law professor at the University of Illinois College of Law. “This really opens the door.”

Mr. Moore, the spokesman for Mr. Milken, denied that he received special treatment.

“Your insinuation that Mike has reaped personal financial benefits from Milken Institute programs is outrageous,” he said. “It’s clear that you are less interested in the objective truth than in assigning to Mike Milken sinister motives that simply do not exist.”

Mr. Moore said that Mr. Milken hadn’t hidden the fact that he had investments in the Nevada opportunity zones. He said Mr. Milken had described them at the Hamptons event that Mr. Mnuchin attended. “There was nothing secretive about it,” he said.

Mr. Kowalski said he hadn’t been aware that Mr. Milken was an investor in the Nevada projects at the same time that his institute was seeking to change the rules governing opportunity zones.

Was he surprised? Mr. Kowalski paused. “Nothing surprises me anymore,” he said.

2020 (Jan 30) - Wall Street Journal - OpEd from Michael Milken - "The New York Times builds a false narrative aimed at discrediting me and tax reform’s opportunity zones."

No One Is Safe From Biased Reporting

By Michael Milken Jan. 30, 2020 6:56 pm ET

A free and independent press is, and should always be, an impenetrable bulwark of our democracy. “Were it left to me to decide whether we should have a government without newspapers or newspapers without a government, I should not hesitate a moment to prefer the latter,” wrote Thomas Jefferson in a 1789 letter. The media’s hallowed role, embodied in the First Amendment, assures near-total freedom to report (and even misreport) the news.

Press freedom, however, implies a responsibility to place truth above narrow partisan campaigns. That’s why editorial and commentary pages must be kept separate from news reporting. That separation has often been breached, but certain prominent news organizations have branded themselves clarions of truth. The New York Times long nurtured such a reputation. So it is profoundly disappointing to see the Times’s news pages increasingly corrupted by the political views of its reporters and editorialists.

Candor requires that I note my own lack of objectivity. For complex reasons, I have been the object of unfounded and vicious attacks by the Times for more than three decades. An article in October falsely suggested that I had intervened to obtain opportunity-zone status for the 107,000-acre Tahoe-Reno Industrial Center, or TRIC, to benefit what the Times said was my minority investment in a partnership holding 688 acres of raw land in TRIC. (It’s my longstanding practice not to divulge what’s in my portfolio.) The singular focus on this tiny sliver of the 107,000 acres makes no sense. TRIC’s 99.4% owners include Tesla, Google, Panasonic, Walmart, Blockchains, Berkshire Hathaway, Switch and other giant companies that have spent billions of dollars at TRIC and have lobbied on its behalf.

I had no knowledge about the extensive activities of the major corporate owners, their lobbyists or advisers. I am not a manager, director or officer of the partnership that owns 688 acres. Yet the Times ignored the major corporate owners to focus on me, a clear indication of their intent to deceive their readers. I can take care of myself, but I’m concerned about all those other victims caught in the middle of partisan mudslinging by the institutions that claim dedication to the truth.

As Fred Smith, founder and CEO of FedEx, wrote in these pages in November, the Times attacked his company by “printing selected facts, connecting unrelated events, and implying nefarious activities when there were none whatever.” That’s exactly what the Times did to me last fall in a long article about Nevada real estate investments. Mr. Smith’s complaint centered on provisions of the 2017 Tax Cuts and Jobs Act and its benefits to FedEx that the Times asserted were unfair.

A different provision of the act established opportunity zones, which provide incentives for private capital to create jobs and assist families in economically depressed areas. It appears the Times doesn’t like the opportunity-zone concept. They and others might prefer direct government assistance rather than incentives to private capital. While reasonable people have taken principled positions on both sides of this debate, it’s a problem when a newspaper violates its mission by carrying editorial views over to the news pages.

This is part of the Times’s multiyear campaign opposing virtually every initiative of the Trump administration. The paper attacked Treasury Secretary Steven Mnuchin, whose department oversees opportunity zones. Then it determined it could conjure a news story virtually out of thin air if it could link Mr. Mnuchin in some way to a private citizen who might benefit from provisions of the Tax Cuts and Jobs Act.

Apparently I fit the bill, and the paper deployed six reporters and researchers for several months looking for dirt. They didn’t find any—I did none of the things they hinted at. But the editors weren’t about to let an absence of facts kill a breathless front-page exposé about how I and other investors stood to “Profit From Trump Tax Break for Poor Areas.” The Times claimed, wrongly, that the Treasury secretary directed regulatory changes for my benefit. Not only did he not make the changes for my benefit, the changes didn’t benefit me. The article reached false conclusions by claiming that mere coincidences proved intent, or by conflating events that occurred months apart in a dizzying feat of obfuscation. This ignored the public record of what really happened.

This is irresponsible journalism. The Times, which sometimes seems to exist in an alternate universe, knew before publication that important conclusions and implications in the article about me were wrong because we and the U.S. Treasury gave them every relevant fact. I’ve never spoken to Mr. Mnuchin, any other government official or anyone else about putting TRIC in an opportunity zone; I have never authorized anyone to act for me on that matter and no one has ever asked me to take any action related to it; I had no knowledge of any lobbying to put TRIC in an opportunity zone.

We gave the Times these and many other facts. They, and anyone with an internet connection, could have easily found the truth. I asked my lawyers to do just that by retaining someone to go online and figure out the real story from the public record. In three days this person found a deep trove of facts that the Times’s six reporters had apparently chosen to ignore. Anyone who wants to know the truth can find an article telling the real story plus a fact sheet and timeline at www.mikemilken.com. These documents provide a sobering antidote to the errors, omissions, deceptions and bias in the Times article.

The Times has now sent my office new questions that suggest another article is in the works. I will vigorously counter any further journalistic mendacity with hard facts and, where appropriate, other actions. But the greater risk is that no one is safe when a previously respected news organization deploys its considerable resources to twist the truth. Keep that in mind as you read future articles attacking opportunities for upward mobility through job creation.

Mr. Milken is chairman of the Milken Institute.

1974 (May?) - Roberts of MITS is planning to make a kit using the new 8080 - price negotiations start...

See (https://en.wikipedia.org/wiki/Ed_Roberts_(computer_engineer))

Roberts decided to return to the kit market with a low cost computer. The target customer would think that "some assembly required" was a desirable feature. In April 1974, Intel released the 8080 microprocessor that Roberts felt was powerful enough for his computer kit, but each 8080 chip sold for $360 in small quantities.[23] Roberts felt that the price of a computer kit had to be under $400; to meet this price, he agreed to order 1,000 microprocessors from Intel for $75 each.[24] The company was down to 20 employees and a bank loan for $65,000 financed the design and initial production of the new computer. Roberts told the bank that he expected to sell 800 computers, but he guessed that it would be around 200.

1974 (May - October) - Amazing story about the Altair Bus that was conceived, designed, tested, and prototyped - All in a very short timespan

Source - https://en.wikipedia.org/wiki/S-100_bus

During the design of the Altair, the hardware required to make a usable machine was not available in time for the January 1975 launch date. The designer, Ed Roberts, also had the problem of the backplane taking up too much room. Attempting to avoid these problems, he placed the existing components in a case with additional "slots", so that the missing components could be plugged in later when they became available. The backplane is split into four separate cards, with the CPU on a fifth. **He then looked for an inexpensive source of connectors, and he came across a supply of military surplus 100-pin edge connectors. The 100-pin bus was created by an anonymous draftsman, who selected the connector from a parts catalog and arbitrarily assigned signal names to groups of connector pins.**[2]

1974 - One story is that the MITS 8800 prototype made it to New York, but it didnt work ..

NOTE that in 1980 - Ed brought eh prototype. but something happened in transit, and the unit would not work. They ran the article anyways.

The S-100 Bus: Past, Present, and Future

Part I

By Sol Libes

This is the first of a two-part article analyzing the S-100-based computer systems picture. The S-100 bus is currently the most widely used microcomputer system bus and hence, I feel, is deserving of an in-depth analysis of where it came from, where it is presently, and what its future looks like. I would like to thank the following individuals who have spoken to me at great length on this topic: Dr. Bob Stewart, IEEE; Bill Godbout, Godbout Electronics; George Morrow, Morrow/Thinker Toys; Steve Edelman, Ithaca InterSystems; and Larry Stein, Computer Mart of New Jersey.

LATE IN 1974, Ed Roberts, then President of a small Albuquerque, New Mexico company by the name of Micro Instrumentation and Telemetry Systems (better known as MITS) called Les Solomon, Technical Editor of *Popular Electronics* magazine. Ed told Les that he had designed a microcomputer system using the new Intel 8080 microprocessor IC, and that MITS wanted to produce it as a kit aimed at hobbyists. MITS was then a small company of about a dozen people who had previously attempted, unsuccessfully, to make and sell radio telemetry kits for model rockets and programmable calculator kits. *Popular Electronics* had helped Ed in promoting these failures in the past; therefore, he turned to them again with his new computer kit project. Two earlier kits based on the Intel 8008 microprocessor had met with some limited acceptance.* MITS, in late 1974, was doing poorly, and the microcomputer kit was, as Ed himself later admitted "a sort of last hope."

Ed projected that they could sell 300 of these computer kits in 1975. Les Solomon thought the project was great and asked Ed to bring the working prototype to New York City for a demonstration and a photo session. PE agreed to run a feature construction-type article, including schematic diagrams. Ed, with Les' help, dream'nt up a name for the computer. They called it the "Altair 8800." Ed brought the prototype unit to NYC, but something happened in transit, and the unit would not work. Les had faith, and decided to run the article anyway.

THE REST OF THE STORY is pretty well known. The article appeared in the January 1975 issue of *Popular Electronics*, which was actually published and distributed in December, 1974. At the end of the article it was mentioned that MITS was offering a parts kit for the Altair 880 for $395. At the time, Intel was charging $350 for a single 8080 IC. The Altair price seemed like an absolute steal. Further, MITS offered a complete PC board set for the Altair for only $77, and a complete set of parts (less the cabinet, power supply and front panel switches) for only $189. How cheap could you get?

It was like opening the flood gates. Within one week after the article appeared, MITS had received 200 orders for the Altair; later that year, they received 300 orders in one afternoon. By the end of February, they had 2000 orders and still all they had was one prototype Altair. Working day and night, with the phones constantly jammed, they managed to ship some board sets by early April; in May, they started shipping complete kits.

THE ALTAIR-8080 used a 100-pin bus that was created by an anonymous draftsman, who selected the connector from a parts catalog and arbitrarily assigned signal names to groups of connector pins. Originally known as the "Altair BUS," its name was changed by other manufacturers of compatible products to the "S-100 Bus." The Altair-8800 came with a 1K-RAM card and promises from MITS of additional boards for I/O interfacing, memory expansion and the like. But the owners of Altairs were desperate for these boards so that they could get their systems to do something.

This led to the introduction of S-100 peripheral plug-in boards by other suppliers. The first company to introduce these boards was a small 2-man operation in a 1,000 square foot shop in Berkeley, California. Named Processor Technology Company, it was run by Gary Ingram and Bob Marsh. Most of their boards were designed by Lee Felsenstein, an independent electronics consultant. Lee's designs included the 3P+S I/O board, which allowed the interfacing of terminals, printers, etc., to the Altair, and the VDM-1, an amazing device which permitted the use of a television monitor to provide alphanumeric and graphics output at very low cost. PTCo also introduced RAM and ROM boards, as well as a software package (appropriately called "Package #1") which made the Altair a real computer rather than just a toy. PTCo also experienced incredible growth.

IN LATE 1975, Bill Gates, Paul Allen, and some cohorts wrote a small Basic language interpreter program in 8080 code with a cross-assembler on a large computer system. They took a paper tape of the program from their location in Seattle down to MITS in Albuquerque, loaded it into an Altair, and with only a few patches, got it to work the same day. Later, Bill and Paul formed Microsoft, Inc., to market their software directly. The result was that by the end of 1975, a person could build a CPU mainframe for a little over $1,000, to which he could attach a terminal and printer and run Basic, Assembler, Debugger, and even do basic word processing. This enabled MITS, during 1975, to sell about 8,000 Altair-8800 computers.

At the end of 1975, Imsai Manufacturing Corporation introduced their own 8080 CPU which also used the same bus structure and a similar operator panel. More rugged, with a larger power supply, it was considered more professional than the Altair so that, although it cost $100 more, it started to eat-out the Altair to both hobbyists and professional users. Imsai was also started as a garage-type operation by Bob Millard, a consulting electronics engineer.

OVER A DOZEN MORE S-100 board vendors came onto the scene in 1976. Cromemco (started in Harry Garland's garage), building the Dazzler,* a color television controller for the Altair and Imsai computers. TDL (Technical Design Labs - later to become XITAN) started in mid 1976 in Roger Amidon's basement with a 2.4-MHz CPU card and a powerful monitor software program. By the end of 1976, there were a half dozen different S-100 mainframes being sold, and close to 30 suppliers of S-100 plug-in boards. Over 30,000 S-100 systems were sold in 1976.

Meanwhile, MITS began thinking of themselves as "the IBM of the microcomputer business." They began to redirect their marketing to commercial and business users; and started to set up a dealer network that sold Altair products exclusively. They introduced a system package for business users.

BUT, MITS LEARNED the hard way that there was a big difference between a hobbyist system and a business system. Now with over 100 employees, MITS was having difficulty developing reliable memory, I/O, and disk storage systems. Even worse, the development of business software was proving an even more formidable task than they had envisioned. By early 1977, Ed Roberts realized that MITS did not have the financial wherewithall for the task. Further, Imsai's better mainframe and the new PTCo Sol computer teamed after Les Solomon, Cromemco, and TDL computers were having an impact on the sales of the Altair. An attempt by MITS to broaden its product line with an Altair-8800 computer was a failure. In addition, several products (e.g. a 4K dynamic RAM board) proved very unreliable, and caused an incredible number of returns to the factory.

AS MITS SOUGHT to move from kits to assembled business systems, they found that their production problems, restrictive marketing organization (limited to less than 60 dealers by early 1977), and the increased competition were causing financial problems. Therefore, in July 1977, Ed Roberts sold MITS to Pertec Computer Corp. Pertec, a conglomerate with high overhead, raised the Altair prices, stopped all kit production, and ceased all promotion to the personal computer market.

Imsai, PTCo, TDL, Cromemco, North Star, Vectorgraphics, and several other S-100 computer system makers were now selling systems through over 500 personal computer stores worldwide. As Pertec sought to turn the Altair into a serious business oriented system, a dark cloud appeared in the form of low-cost integrated computer systems from Commodore (PET) and Radio Shack (TRS-80), which had become available by the end of 1977. By year-end, Pertec gave up the ghost and ceased production of all Altair products. Despite this event, over 60,000 S-100 systems were sold in 1977.

AS MORE AND MORE manufacturers introduced S-100 mainframes and peripheral plug-in boards, it became apparent that compatibility problems were developing. In many cases, S-100 boards would operate in some S-100 systems and not in others.

Part I

The S-100 Bus

continued from page seven

The problems derived from the fact that MITS had only loosely defined the electrical specifications of the bus and had left 19 of the 100 pins undefined. Also, S-100 manufacturers started to look to the future. They realized that some redesign of the S-100 bus was required to accommodate the new 16-bit microprocessors and expanding systems capabilities, i.e., multi-processing, higher speed operation, and enhanced interrupt vectoring.

The result was that in mid 1978, several companies (most notably Morrow/Thinker Toys, Parasitic Engineering, and Ithaca InterSystems) began development, under the aegis of the IEEE (Institute of Electrical & Electronic Engineers), of an S-100 Bus Standard**. All in all, 1978 was another glorious year for S-100 system producers as nearly 100,000 S-100 systems were manufactured.

THE YEAR 1979 WAS DISASTROUS for three of the leading S-100 manufacturers. A tight money market combined with bad marketing decisions and manufacturing problems led to Imsai going bankrupt and PTCo closing their doors (even though they were financially solvent). Polymorphics filed for bankruptcy but was able to get additional financing, go through reorganization, and by mid-year, turned around and came out of bankruptcy. Imsai was purchased by the Fisher-Freitas Corporation, who have resumed manufacturing and marketing of the entire Imsai product line.

On the other hand, 1979 proved to be another excellent year for most S-100 system suppliers: six new S-100 mainframes were introduced, making a total of 17 companies manufacturing S-100 mainframes. Nearly 60 companies were manufacturing S-100 plug-in boards, and over 140 companies offered S-100 software packages. Although the increase in the sales of S-100 hardware was significant in 1979, it was not the dramatic 100% to 200% increases of prior years. On the other hand, S-100 software sales skyrocketed. Total number and dollar figures are difficult to obtain, since so many manufacturers are involved. However, there is little doubt that presently, S-100 type computer systems are more widespread than any other type of computer system.

In the second, and concluding, part of this article, I will analyze the present state and future prospects of the S-100 marketplace. ■

**This proposed standard is 25 pages long, nearing adoption, and has been printed in *Computer* (July 1978) and *S-100 Microsystems* (Jan-Feb 1980) magazines.

CP/M®2

CONTROL PROGRAM FOR MICROCOMPUTERS

NOW BETTER THAN EVER

You've probably heard about CP/M. But if you haven't, it's the world's most popular operating system. CP/M is considered the "software bus" for 8080 and Z80 microcomputers because it gives you the hardware-independent interface you need to make your computer work for you. Because it's hardware-independent, you can get programming languages, word processing software, and business applications packages from scores of suppliers at affordable prices.

CP/M 2.0 is the latest in the evolution of a proven reliable and efficient software system. It's the kind of reliability that comes from five years of field testing in thousands of installations. And it's supported by an experienced staff dedicated to maintaining CP/M as the best product in the industry.

CP/M 2.0 gives you many new features, with an enhanced upward compatible file system, powerful new random access capabilities, and unprecedented field alteration facilities which allow you to tailor CP/M 2.0 to manage virtually any disk subsystem. From minidisks, floppy disks, all the way to high-capacity hard disks, the flexibility of CP/M 2.0 makes it a truly universal operating system. Get yourself or your company on the software bus: contact us for further details, or ask your dealer about CP/M 2.0 availability for your computer.

DISKETTE and DOCUMENTATION
Single Quantity Prices: $150

MP/M™

MULTI-PROGRAMMING MONITOR

NEW INDUSTRY STANDARD

Digital Research announces a deluxe operating system that provides big computer facilities at small computer prices. MP/M is a monitor program which operates with your microcomputer to provide multi-terminal access with multiprogramming at each terminal. Best of all, it's CP/M compatible which means you can run a wide variety of programming languages, applications packages, and development software.

If you want, you can run simultaneous editors, program translators, and background printer spoolers. Or you can use MP/M for data entry or data-base access from remote terminals. Or you can use MP/M real-time features to monitor an assembly line and automatically schedule programs for execution throughout the day. MP/M makes an excellent focal point for a cluster of connected microcomputers. The possibilities are limitless.

Like CP/M, MP/M is especially built to adapt to most 8080 or Z80 microcomputers, with an 8086 version on the way. You can operate your I/O devices either interrupt-driven or polled, and you can even write your own system processes which are combined with MP/M through a simple system generation. It's an exciting new product from the most experienced systems software supplier in the microcomputer industry. Contact us for details, or ask your dealer about MP/M availability for your computer system.

Digicast to Begin

continued from page one

user may review them at a later time: the machine could also search a continuous stream of real estate or want ad listings for the desired products and services. Software applications for utilizing the data stream can be arbitrarily complex.

The Digicast Project successfully demonstrated transmission of text at 9600 baud at the 4th West Coast Computer Faire, held in San Francisco, in May, 1979. Since then, successful field tests have been carried out at a commercial transmitter in Sacramento. Negotiations are presently underway with three radio stations in the San Jose area for establishment of a commercial Datacast service.

Datacast estimates that a 9600 baud stream would offer the equivalent of 2500 newspaper pages per day. The company's current plans indicate that receivers will be available for less than $400, including software; they are expected to plug into most popular computers, including the TRS-80, Apple, PET, DEC PDP-8, and S-100 computers, as well as into most RS-232 serial ports.

According to Jim Warren, president of Digital Wireless, the software supplied with the receivers will include, at a minimum, routines for entering keywords, for scanning the full text for those keywords, and for double- or triple- buffering text onto the media. There will also be article retrieval software to allow the user to retrieve material stored in his absence for review at his convenience. Warren also said that the plans for broadcasting included quadruple redundancy, i.e., three times during the day and one time at night for each item.

Digital Wireless can be contacted at 345 Swett Rd., Woodside, CA 94062. ■

The **S-100 bus** or **Altair bus**, ***IEEE696****-1983 (withdrawn)*, is an early computer bus designed in 1974 as a part of the Altair 8800. The S-100 bus was the first industry standard expansion bus for the microcomputer industry. S-100 computers, consisting of processor and peripheral cards, were produced by a number of manufacturers. The S-100 bus formed the basis for homebrew computers whose builders (e.g., the Homebrew Computer Club) implemented drivers for CP/M and MP/M. These S-100 microcomputers ran the gamut from hobbyist toy to small business workstation and were common in early home computers until the advent of the IBM PC (which some of them outperformed).

Architecture[edit]

Harry Garland and Roger Melen, co-founders of Cromemco, holding S-100 backplane (1981)

The S-100 bus is a passive backplane of 100-pin printed circuit board edge connectors wired in parallel. Circuit cards measuring 5 × 10-inches serving the functions of CPU, memory, or I/O interface plugged into these connectors. The bus signal definitions closely follow those of an 8080 microprocessor system, since the Intel 8080 microprocessor was the first microprocessor hosted on the S-100 bus. The 100 lines of the S-100 bus can be grouped into four types: 1) Power, 2) Data, 3) Address, and 4) Clock and control.[1]

Power supplied on the bus is bulk unregulated +8 Volt DC and ±16 Volt DC, designed to be regulated on the cards to +5 V (used by TTL ICs), -5 V and +12 V for Intel 8080 CPU IC, ±12 V RS-232 line driver ICs, +12 V for disk drive motors. The onboard voltage regulation is typically performed by devices of the 78xx family (for example, a 7805 device to produce +5 volts). These were linear regulators which are commonly mounted on heat sinks.

The bi-directional 8-bit data bus of the Intel 8080 is split into two unidirectional 8-bit data buses. The processor could use only one of these at a time. The Sol-20 used a variation that had only a single 8-bit bus and used the now-unused pins as signal grounds to reduce electronic noise. The direction of the bus, in or out, was signaled using the otherwise unused DBIN pin. This became universal in the S-100 market as well, making the second bus superfluous. Later, these two 8-bit busses would be combined to support a 16-bit data width for more advanced processors, using the Sol's system to signal the direction.

The address bus is 16-bits wide in the initial implementation and later extended to 24-bits wide. A bus control signal can put these lines in a tri-state condition to allow direct memory access. The Cromemco Dazzler, for example, is an early S-100 card that retrieved digital images from memory using direct memory access.

Clock and control signals are used to manage the traffic on the bus. For example, the *DO Disable* line will tristate the address lines during direct memory access. Unassigned lines of the original bus specification were later assigned to support more advanced processors. For example, the Zilog Z-80 processor has a non-maskable interrupt line that the Intel 8080 processor does not. One unassigned line of the S-100 bus then was reassigned to support the non-maskable interrupt request.

History[edit]

The Cromemco XXU processor board, introduced in 1986. At 16.7 MHz, it is the fastest CPU ever developed for the S-100 bus. It uses a Motorola 68020 processor with 68881 co-processor and 16 Kbytes of high-speed cache memory. This CPU is used in the Cromemco CS-250 computer, widely deployed by the U.S. Air Force.

During the design of the Altair, the hardware required to make a usable machine was not available in time for the January 1975 launch date. The designer, Ed Roberts, also had the problem of the backplane taking up too much room. Attempting to avoid these problems, he placed the existing components in a case with additional "slots", so that the missing components could be plugged in later when they became available. The backplane is split into four separate cards, with the CPU on a fifth. He then looked for an inexpensive source of connectors, and he came across a supply of military surplus 100-pin edge connectors. The 100-pin bus was created by an anonymous draftsman, who selected the connector from a parts catalog and arbitrarily assigned signal names to groups of connector pins.[2]

A burgeoning industry of "clone" machines followed the introduction of the Altair in 1975. Most of these used the same bus layout as the Altair, creating a new industry standard. These companies were forced to refer to the system as the "Altair bus", and wanted another name in order to avoid referring to their competitor when describing their own system. The "S-100" name, short for "Standard 100", was coined by Harry Garland and Roger Melen, co-founders of Cromemco.[3][4] While on a flight to attend the Atlantic City PC '76 microcomputer conference in August 1976, they shared the cabin with Bob Marsh and Lee Felsenstein of Processor Technology. Melen went over to them to convince them to adopt the same name. He had a beer in his hand and when the plane hit a bump, Melen spilt some the beer on Marsh. Marsh agreed to use the name, which Melen ascribes to him wanting to get Melen to leave with his beer.[5]

The term first appeared in print in a Cromemco advertisement in the November 1976 issue of Byte magazine.[6] The first symposium on the S-100 bus, moderated by Jim Warren, was held November 20, 1976 at Diablo Valley College with a panel consisting of Harry Garland, George Morrow, and Lee Felsenstein.[7] Just one year later, the S-100 Bus would be described as "the most used busing standard ever developed in the computer industry."[8]

Cromemco was the largest of the S-100 manufacturers, followed by Vector Graphic and North Star Computers.[9] Other innovators were companies such as Alpha Microsystems, IMS Associates, Inc., Godbout Electronics (later CompuPro), and Ithaca Intersystems. In May 1984, *Microsystems* published a comprehensive S-100 product directory listing over 500 "S-100/IEEE-696" products from over 150 companies.[10]

The S-100 bus signals were simple to create using an 8080 CPU, but increasingly less so when using other processors like the 68000. More board space was occupied by signal conversion logic. Nonetheless by 1984, eleven different processors were hosted on the S-100 bus, from the 8-bit Intel 8080 to the 16-bit Zilog Z-8000.[10] In 1986, Cromemco introduced the XXU card, designed by Ed Lupin, utilizing a 32-bit Motorola 68020 processor.[11]

IEEE-696 Standard[edit]

As the S-100 bus gained momentum, there was a need to develop a formal specification of the bus to help assure compatibility of products produced by different manufacturers. There was also a need to extend the bus so that it could support processors more capable than the Intel 8080 used in the original Altair Computer. In May 1978, George Morrow and Howard Fullmer published a “Proposed Standard for the S-100 Bus” noting that 150 vendors were already supplying products for the S-100 Bus. This proposed standard documented the 8-bit data path and 16-bit address path of the bus and stated that

consideration was being given to extending the data path to 16 bits and the address path to 24 bits.[12]

In July 1979 Kells Elmquist, Howard Fullmer, David Gustavson, and George Morrow published a "Standard Specification for S-100 Bus Interface Devices."[13] In this specification the data path was extended to 16 bits and the address path was extended to 24 bits. The IEEE 696 Working Group, chaired by Mark Garetz, continued to develop the specification which was proposed as an IEEE Standard and approved by the IEEE Computer Society on June 10, 1982.[14]

The American National Standards Institute (ANSI) approved the IEEE standard on September 8, 1983. The computer bus structure developed by Ed Roberts for the Altair 8800 computer had been extended, rigorously documented, and now designated as the American National Standard IEEE Std 696-1983.[14]

Retirement[edit]

Racks of Cromemco S-100 Systems at the Chicago Mercantile Exchange in 1984

IBM introduced the IBM Personal Computer in 1981 and followed it with increasingly capable models: the XT in 1983 and the AT in 1984. The success of these computers cut deeply into the market for S-100 bus products. In May 1984, Sol Libes (who had been a member of the IEEE-696 Working Group) wrote in *Microsystems*: "there is no doubt that the S-100 market can now be considered a mature industry with only moderate growth potential, compared to the IBM PC-compatible market."[15]

As the IBM PC products captured the low-end of the market, S-100 machines moved up-scale to more powerful OEM and multiuser systems. Banks of S-100 bus computers were used, for example, to process the trades at the Chicago Mercantile Exchange; the United States Air Force deployed S-100 bus machines for their mission planning systems.[16][17] However throughout the 1980s the market for S-100 bus machines for the hobbyist, for personal use, and even for small business was on the decline.[18]

The market for S-100 bus products continued to contract through the early 1990s, as IBM-compatible computers became more capable. In 1992, the Chicago Mercantile Exchange, for example, replaced their S-100 bus computers with the IBM model PS/2.[19] By 1994 the S-100 bus industry had contracted sufficiently that the IEEE did not see a need to continue supporting the IEEE-696 standard. The IEEE-696 standard was retired on June 14, 1994.[14]

CPU

Intel 8080 @ 2 MHz

The **Altair 8800** is a microcomputer designed in 1974 by MITS and based on the Intel 8080 CPU.[1] Interest grew quickly after it was featured on the cover of the January 1975 issue of Popular Electronics[2] and was sold by mail order through advertisements there, in *Radio-Electronics*, and in other hobbyist magazines.[3][4] The Altair is widely recognized as the spark that ignited the microcomputer revolution[5] as the first commercially successful personal computer.[6] The computer bus designed for the Altair was to become a *de facto* standard in the form of the S-100 bus, and the first programming language for the machine was Microsoft's founding product, Altair BASIC.[7][8]

History[edit]

This "Tracking Light for Model Rockets" project appeared in the September 1969 issue of *Model Rocketry* and was the first kit sold by MITS.

While serving at the Air Force Weapons Laboratory at Kirtland Air Force Base, Ed Roberts and Forrest M. Mims III decided to use their electronics background to produce small kits for model rocket hobbyists. In 1969, Roberts and Mims, along with Stan Cagle and Robert Zaller, founded Micro Instrumentation and Telemetry Systems (MITS) in Roberts' garage in Albuquerque, New Mexico, and started selling radio transmitters and instruments for model rockets.

Calculators[edit]

The model rocket kits were a modest success and MITS wanted to try a kit that would appeal to more hobbyists. The November 1970 issue of *Popular Electronics* featured the Opticom, a kit from MITS that would send voice over an LED light beam. As Mims and Cagle were losing interest in the kit business, Roberts bought his partners out, then began developing a calculator kit. Electronic Arrays had just announced a set of six large scale integrated (LSI) circuit chips that would make a four-function calculator.[9] The MITS 816 calculator kit used the chipset and was featured on the November 1971 cover of *Popular Electronics*. This calculator kit sold for $175 ($275 assembled).[10] Forrest Mims wrote the assembly manual for this kit and many others over the next several years. He often accepted a copy of the kit as payment.

The calculator was successful and was followed by several improved models. The MITS 1440 calculator was featured in the July 1973 issues of *Radio-Electronics*. It had a 14-digit display, memory, and square root function. The kit sold for $200 and the assembled version was $250.[11] MITS later developed a programmer unit that would connect to the 816 or 1440 calculator and allow programs of up to 256 steps.[12]

Test equipment[edit]

In addition to calculators, MITS made a line of test equipment kits. These included an IC tester, a waveform generator, a digital voltmeter, and several other instruments. To keep up with the demand, MITS moved into a larger building at 6328 Linn NE in Albuquerque in 1973. They installed a wave soldering machine and an assembly line at the new location. In 1972, Texas Instruments developed its own calculator chip and started selling complete calculators at less than half the price of other commercial models. MITS and many other companies were devastated by this, and Roberts struggled to reduce his quarter-million-dollar debt.

Popular Electronics[edit]

January 1975 *Popular Electronics* with the Altair 8800 computer. Published on November 29, 1974.[13]

In January 1972, *Popular Electronics* merged with another Ziff-Davis magazine, *Electronics World*. The change in editorial staff upset many of their authors, and they started writing for a competing magazine, *Radio-Electronics*. In 1972 and 1973, some of the best construction projects appeared in *Radio-Electronics*.

In 1974, Art Salsberg became editor of *Popular Electronics*. It was Salsberg's goal to reclaim the lead in electronics projects. He was impressed with Don Lancaster's TV Typewriter (*Radio Electronics*, September 1973) article and wanted computer projects for *Popular Electronics*. Don Lancaster did an ASCII keyboard for *Popular Electronics* in April 1974. They were evaluating a computer trainer project by Jerry Ogden when the Mark-8 8008-based computer by Jonathan Titus appeared on the July 1974 cover of *Radio-Electronics*. The computer trainer was put on hold and the editors looked for a real computer system. (*Popular Electronics* gave Jerry Ogden a column, *Computer Bits*, starting in June 1975.)[14]

One of the editors, Les Solomon, knew MITS was working on an Intel 8080 based computer project and thought Roberts could provide the project for the always popular January issue. The TV Typewriter and the Mark-8 computer projects were just a detailed set of plans and a set of bare printed circuit boards. The hobbyist faced the daunting task of acquiring all of the integrated circuits and other components. The editors of *Popular Electronics* wanted a complete kit in a professional-looking enclosure.[15]

Ed Roberts and his head engineer, Bill Yates, finished the first prototype in October 1974 and shipped it to *Popular Electronics* in New York via the Railway Express Agency. However, it never arrived due to a strike by the shipping company. Solomon already had a number of pictures of the machine and the article was based on them. Roberts got to work on building a replacement. The computer on the magazine cover is an empty box with just switches and LEDs on the front panel. The finished Altair computer had a completely different circuit board layout than the prototype shown in the magazine.[16] The January 1975 issues appeared on newsstands a week before Christmas of 1974 and the kit was officially (if not yet practically) available for sale.[14][15][13]

The name[edit]

A kit-built Altair 8800 computer with the popular Model 33 ASR (Automatic Send and Receive) Teletype as terminal.

The typical MITS product had a generic name like the "Model 1440 Calculator" or the "Model 1600 Digital Voltmeter". Ed Roberts was busy finishing the design and left the naming of the computer to the editors of *Popular Electronics*.

One explanation of the Altair name, which editor Les Solomon later told the audience at the first Altair Computer Convention (March 1976), is that the name was inspired by Les's 12-year-old daughter, Lauren. "She said why don't you call it Altair – that's where the Enterprise is going tonight."[17] The *Star Trek* episode is probably "Amok Time", as this is the only one from *The Original Series* which takes the Enterprise crew to Altair (Six).

Another explanation is that the Altair was originally going to be named the PE-8 (Popular Electronics 8-bit), but Les Solomon thought this name to be rather dull, so Les, Alexander Burawa (associate editor), and John McVeigh (technical editor) decided that: "It's a stellar event, so let's name it after a star." McVeigh suggested "Altair", the twelfth brightest star in the sky.[15][18]

Intel 8080[edit]

Ed Roberts had designed and manufactured programmable calculators and was familiar with the microprocessors available in 1974. He thought the Intel 4004 and Intel 8008 were not powerful enough (in fact several microcomputers based on Intel chips were already on the market: the Canadian company Microsystems International's CPS-1 built-in 1972 used a MIL MF7114 chip modeled on the 4004, the Micral marketed in January 1973 by the French company R2E and the MCM/70 marketed in 1974 by the Canadian company Micro Computer Machines); the National Semiconductor IMP-8 and IMP-16 required external hardware; the Motorola 6800 was still in development. So he chose the 8-bit Intel 8080.[19] At that time, Intel's main business was selling memory chips by the thousands to computer companies. They had no experience in selling small quantities of microprocessors. When the 8080 was introduced in April 1974, Intel set the single unit price at $360 (About $1,700 in 2014 dollars). "That figure had a nice ring to it," recalled Intel's Dave House in 1984. "Besides, it was a computer, and they usually cost thousands of dollars, so we felt it was a reasonable price."[20] Ed Roberts had experience in buying OEM quantities of calculator chips and he was able to negotiate a $75 price (about $350 in 2014 dollars) for the 8080 microprocessor chips.[21][22]

Intel made the Intellec-8 Microprocessor Development System that typically sold for a very profitable $10,000. It was functionally similar to the Altair 8800 but it was a commercial grade system with a wide selection of peripherals and development software.[23][24] Customers would ask Intel why their Intellec-8 was so expensive when that Altair was only $400. Some salesmen said that MITS was getting cosmetic rejects or otherwise inferior chips. In July

1975, Intel sent a letter to its sales force stating that the MITS Altair 8800 computer used standard Intel 8080 parts. The sales force should sell the Intellec system based on its merits and that no one should make derogatory comments about valued customers like MITS. The letter was reprinted in the August 1975 issue of MITS Computer Notes.[25] The "cosmetic defect" rumor has appeared in many accounts over the years although both MITS and Intel issued written denials in 1975.[26]

The launch[edit]

A May 1975 advertisement for the Altair 8800 Computer appeared in Popular Electronics, Radio-Electronics, and other magazines.

For a decade, colleges had required science and engineering majors to take a course in computer programming, typically using the FORTRAN or BASIC languages.[27][28] This meant there was a sizable customer base who knew about computers. In 1970, electronic calculators were not seen outside of a laboratory, but by 1974 they were a common household item. Calculators and video games like Pong introduced computer power to the general public. Electronics hobbyists were moving on to digital projects such as digital voltmeters and frequency counters. The Altair had enough power to be actually useful, and was designed as an expandable system that opened it up to all sorts of applications.

Ed Roberts optimistically told his banker that he could sell 800 computers, while in reality they needed to sell 200 over the next year just to break even. When readers got the January issue of *Popular Electronics*, MITS was flooded with inquiries and orders. They had to hire extra people just to answer the phones. In February MITS received 1,000 orders for the Altair 8800. The quoted delivery time was 60 days but it was months before they could meet that. Roberts focused on delivering the computer; all of the options would wait until they could keep pace with the orders. MITS claimed to have delivered 2,500 Altair 8800s by the end of May.[29] The number was over 5,000 by August 1975.[30] **MITS had under 20 employees in January but had grown to 90 by October 1975**.[31]

The Altair 8800 computer was a break-even sale for MITS. They needed to sell additional memory boards, I/O boards and other options to make a profit. The system came with a "1024 word" (1024 byte) memory board populated with 256 bytes. The BASIC language was announced in July 1975 and it required one or two 4096 word memory boards and an interface board.

MITS Price List, *Popular Electronics*, August 1975.[32]

DescriptionKit PriceAssembled

- 4K BASIC language (when purchased with Altair, 4096 words of memory and interface board) $60
- 8K BASIC language (when purchased with Altair, two 4096-word memory boards and interface board) $75

MITS had no competition in the US for the first half of 1975. Their 4K memory board used dynamic RAM and it had several design problems.[31] The delay in shipping optional boards and the problems with the 4K memory board created an opportunity for outside suppliers.

An enterprising Altair owner, Robert Marsh, designed a 4K static memory that was plug-in compatible with the Altair 8800 and sold for $255.[33] His company was Processor Technology, one of the most successful Altair compatible board suppliers. Their advertisement in the July 1975 issue of *Popular Electronics* promised interface and PROM boards in addition to the 4K memory board. They would later develop a popular video display board that would plug directly into the Altair.

A consulting company in San Leandro, California, IMS Associates Inc., wanted to purchase several Altair computers but the long delivery time convinced them that they should build their own computers. In the October 1975 *Popular Electronics*, a small advertisement announced the IMSAI 8080 computer. The ad noted that all boards were "plug compatible" with the Altair 8800. The computer cost $439 for a kit. The first 50 IMSAI computers shipped in December 1975.[34] The IMSAI 8080 computer improved on the original Altair design in several areas. It was easier to assemble: The Altair required 60 wire connections between the front panel and the mother board (backplane.) The IMSAI motherboard had 18 slots. The MITS motherboard consisted of 4 slots segments that had to be connected together with 100 wires. The IMSAI also had a larger power supply to handle the increasing number of expansion boards used in typical systems. The IMSAI advantage was short lived because MITS had recognized these shortcomings and developed the Altair 8800B which was introduced in June 1976.

In 1977, Pertec Computer Corporation purchased MITS and began to market the computer, without changes (except for branding), as the PCC 8800 in 1978.[35]

Description[edit]

Altair 8800 front panel (1st model)

Altair 8800b front panel (2nd model)

Inside the Altair 8800b (2nd model)

In the first design of the Altair, the parts needed to make a complete machine would not fit on a single motherboard, and the machine consisted of four boards stacked on top of each other with stand-offs. Another problem facing Roberts was that the parts needed to make a truly useful computer weren't available, or wouldn't be designed in time for the January launch date. So during the construction of the second model, he decided to build most of the machine on removable cards, reducing the motherboard to nothing more than an interconnect between the cards, a backplane. The basic machine consisted of five cards, including the CPU on one and memory on another. He then looked for a cheap source of connectors, and came across a supply of 100-pin edge connectors. The S-100 bus was eventually acknowledged by the professional computer community and adopted as the IEEE-696 computer bus standard.

The Altair bus consists of the pins of the Intel 8080 run out onto the backplane. No particular level of thought went into the design, which led to such disasters as shorting from various power lines of differing voltages being located next to each other.[*citation needed*] Another oddity was that the system included two unidirectional 8-bit data buses, when the normal practice was for a single bidirectional bus (this oddity did, however, allow a later expansion of the S-100 standard to 16 bits bidirectional by using both 8-bit buses in parallel). A deal on power supplies led to the use of +8V and +18V,[*citation needed*] which had to be locally regulated on the cards to TTL (+5V) or RS-232 (+12V) standard voltage levels.

The Altair shipped in a two-piece case. The backplane and power supply were mounted on a base plate, along with the front and rear of the box. The "lid" was shaped like a C, forming the top, left, and right sides of the box. The front panel, which was inspired by the Data General Nova minicomputer, included a large

number of toggle switches to feed binary data directly into the memory of the machine, and a number of red LEDs to read those values back out.[36]

Programming the Altair via the front panel could be a tedious and time-consuming process. Programming required the toggling of the switches to positions corresponding to the desired 8080 microprocessor instruction or opcode in binary, then used the 'DEPOSIT NEXT' switch to load that instruction into the next address of the machine's memory. This step was repeated until all the opcodes of a presumably complete and correct program were in place. The only output from the programs was the patterns of lights on the panel. Nevertheless, many were sold in this form. Development was already underway on additional cards, including a paper tape reader for storage, additional RAM cards, and an RS-232 interface to connect to a proper Teletype terminal.

Software[edit]

Altair BASIC[edit]

Main article: Altair BASIC

Ed Roberts received a letter from Traf-O-Data asking if he would be interested in buying its BASIC programming language for the machine. He called the company and reached a private home, where no one had heard of anything like BASIC. In fact the letter had been sent by Bill Gates and Paul Allen from the Boston area, and they had no BASIC yet to offer. When they called Roberts to follow up on the letter he expressed his interest, and the two started work on their BASIC interpreter using a self-made simulator for the 8080 on a PDP-10 minicomputer. They figured they had 30 days before someone else beat them to the punch, and once they had a version working on the simulator, Allen flew to Albuquerque to deliver the program, Altair BASIC (aka MITS 4K BASIC), on a paper tape. The first time it was run, it displayed "READY"[37] then Allen typed "PRINT 2+2" and it immediately printed the correct answer: "4". The game *Lunar Lander* was entered in and this worked as well. Gates soon joined Allen and formed Microsoft, then spelled "Micro-Soft".

Altair DOS[edit]

Announced in late 1975, it started shipping in August 1977.

Henry Edward "Ed" Roberts (September 13, 1941 – April 1, 2010) was an American engineer, entrepreneur and medical doctor who invented the first commercially successful personal computer in 1974.[1] He is most often known as "the father of the personal computer."[2] He founded Micro Instrumentation and Telemetry Systems (MITS) in 1970 to sell electronics kits to model rocketry hobbyists, but the first successful product was an electronic calculator kit that was featured on the cover of the November 1971 issue of *Popular Electronics*.[3] The calculators were very successful and sales topped one million dollars in 1973.[4] A brutal calculator price war left the company deeply in debt by 1974. Roberts then developed the Altair 8800 personal computer that used the new Intel 8080 microprocessor. This was featured on the cover of the January 1975 issue of *Popular Electronics*, and hobbyists flooded MITS with orders for this $397 computer kit.

Bill Gates and Paul Allen joined MITS to develop software and Altair BASIC was Microsoft's first product. Roberts sold MITS in 1977 and retired to Georgia where he farmed, studied medicine and eventually became a small-town doctor living in Cochran, Georgia.

Early life[edit]

Roberts was born on September 13, 1941 in Miami, Florida to Henry Melvin Roberts, an appliance repairman, and Edna Wilcher Roberts, a homemaker. His younger sister Cheryl was born in 1947. During World War II, while his father was in the Army, Roberts and his mother lived on the Wilcher family farm in Wheeler County, Georgia. After the war, the family returned to Miami, but Roberts would spend his summers with his grandparents in rural Georgia. Roberts' father had an appliance repair business in Miami.[5][6]

Roberts became interested in electronics and built a small relay-based computer while in high school. Medicine was his true passion, however, and he entered University of Miami with the intention of becoming a doctor, the first in his family to attend college. There he met a neurosurgeon who shared his interest in electronics. The doctor suggested that Roberts get an engineering degree before applying to medical school, and Roberts changed his major to electrical engineering.[6][7]

Roberts married Joan Clark while at the university, and when she became pregnant Roberts knew that he would have to drop out of school to support his

Roberts married Joan Clark while at the university, and when she became pregnant Roberts knew that he would have to drop out of school to support his new family. The U.S. Air Force had a program that would pay for college, and in May 1962 he enlisted with the hope of finishing his degree through the Airman Education & Commissioning Program.[6][8]

After basic training, Roberts attended the Cryptographic Equipment Maintenance School at Lackland Air Force Base in San Antonio, Texas. Because of his electrical engineering studies at college, Roberts was made an instructor at the Cryptographic School when he finished the course. To augment his meager enlisted man's pay, Roberts worked on several off-duty projects and even set up a one-man company, Reliance Engineering. The most notable job was to create the electronics that animated the Christmas characters in the window display of Joske's department store in San Antonio. In 1965, he was selected for an Air Force program to complete his college degree and become a commissioned officer. Roberts earned an electrical engineering degree from Oklahoma State University in 1968 and was assigned to the Laser Division of the Weapons Laboratory at Kirtland AFB in Albuquerque, New Mexico.[6][9] In 1968, he looked into applying to medical school but learned that, at age 27, he was considered too old.[6]

Micro Instrumentation and Telemetry Systems[edit]

Main article: Micro Instrumentation and Telemetry Systems

March 1970 advertisement, when MITS was located in Ed Roberts' garage.

Roberts worked with Forrest Mims at the Weapons Laboratory, and both shared an interest in model rocketry. Mims was an advisor to the Albuquerque Model Rocket Club and met the publisher of *Model Rocketry* magazine at a rocketry conference. This led to an article in the September 1969 issue of *Model Rocketry*, "Transistorized Tracking Light for Night Launched Model Rockets".[10] Roberts, Mims, and lab coworkers Stan Cagle and Bob Zaller decided that they could design and sell electronics kits to model rocket hobbyists.[11] Roberts wanted to call the new company Reliance Engineering, but Mims wanted to form an acronym similar to the Massachusetts Institute of Technology's MIT. Cagle came up with Micro Instrumentation and Telemetry Systems (MITS).[12] They advertised the light flasher, a roll rate sensor with transmitter, and other kits in *Model Rocketry*, but the sales were disappointing.

Mims wrote an article about the new technology of light-emitting diodes that was to be published in the November 1970 issue of *Popular Electronics* magazine. He asked the editors if they also wanted a project story, and they agreed. Roberts and Mims developed an LED communicator that would transmit voice on an infrared beam of light to a receiver hundreds of feet away. Readers could buy a kit of parts to build the Opticom LED Communicator from MITS for $15.[13] MITS sold just over a hundred kits. Mims was now out of the Air Force and wanted to pursue a career as a technology writer. Roberts bought out his original partners and focused the company on the emerging market of electronic calculators.[14]

Calculators[edit]

June 1972 advertisement for MITS Model 1440 Calculator

Roberts's first real experience with computers came while at Oklahoma State University where engineering students had free access to an IBM 1620 computer.[15] His office at the Weapons Laboratory had the state of the art Hewlett-Packard 9100A programmable calculator in 1968. Roberts had always wanted to build a digital computer and, in July 1970, Electronic Arrays announced a set of six LSI integrated circuits that would make a four-function calculator.[16][17] Roberts was determined to design a calculator kit and got fellow Weapons Laboratory officers William Yates and Ed Laughlin to invest in the project with time and money.[18]

The first product was a "four-function" calculator that could add, subtract, multiply, and divide. The display was only eight digits, but the calculations were performed with 16 digits precision. The MITS Model 816 calculator kit was featured on the November 1971 cover of *Popular Electronics*.[3] The kit sold for $179 and an assembled unit was $275. Unlike the previous kits that MITS had offered, thousands of calculator orders came in each month.[19]

The monthly sales reached $100,000 in March 1973, and MITS moved to a larger building with 10,000 square feet (930 square meters) of space.[4] In 1973, MITS was selling every calculator that they could make, and 110 employees worked in two shifts assembling them.[20] The functionality of calculator integrated circuits increased at a rapid pace and Roberts was designing and producing new models. The popularity of electronic calculators drew the traditional office equipment companies and the semiconductor companies into the market. In September 1972, Texas Instruments (TI) introduced the TI-2500 portable four-function calculator that sold for $120.[21] The larger companies could sell below cost to win market share. By early 1974, Ed Roberts found that he could purchase a calculator in a retail store for less than his cost of materials. MITS was now $300,000 in debt, and Roberts was looking for a new hit product.[22]

Altair 8800 computer[edit]

Main article: Altair 8800

May 1975 advertisement for the Altair 8800 computer kit

Roberts decided to return to the kit market with a low cost computer. The target customer would think that "some assembly required" was a desirable feature. In April 1974, Intel released the 8080 microprocessor that Roberts felt was powerful enough for his computer kit, but each 8080 chip sold for $360 in small quantities.[23] Roberts felt that the price of a computer kit had to be under $400; to meet this price, he agreed to order 1,000 microprocessors from Intel for $75 each.[24] The company was down to 20 employees and a bank loan for $65,000 financed the design and initial production of the new computer. Roberts told the bank that he expected to sell 800 computers, but he guessed that it would be around 200.[25]

Art Salsberg, editorial director of *Popular Electronics*, was looking for a computer construction project, and his technical editor Les Solomon knew that MITS was working on an Intel 8080-based computer kit. Roberts assured Solomon that the project would be complete by November to meet the press deadline for the January 1975 issue. The first prototype was finished in October and shipped to *Popular Electronics* in New York for the cover photograph, but it was lost in transit. Solomon already had a number of pictures of the machine, and the article was based on them. Roberts and Yates got to work on building a replacement. The computer on the magazine cover was an empty box with just switches and LEDs on the front panel. The finished Altair computer had a completely different circuit board layout than the prototype shown in the magazine.[26]

Altair 8800 Computer with 8-inch floppy disk system

MITS products typically had generic names such as the Model 1440 Calculator or the Model 1600 Digital Voltmeter. The editors of *Popular Electronics* wanted a more alluring name for the computer. MITS technical writer David Bunnell came up with three pages of possible names, but Roberts was too busy

finishing the computer design to choose one. There are several versions of the story of who selected Altair as the computer name. At the first Altair Computer Convention (March 1976), Les Solomon told the audience that the name was inspired by his 12-year-old daughter Lauren. "She said why don't you call it Altair – that's where the [Star Trek] Enterprise is going tonight."[6][27] The December 1976 issue of *Popular Science* misquoted this account, giving credit to Ed Roberts' daughter.[28] His only daughter Dawn was not born until 1983.[1] Both of these versions have appeared in many books, magazines, and web sites.

Editor Alexander Burawa recalls a less dramatic version. The Altair was originally going to be named the PE-8 (Popular Electronics 8-bit), but Les Solomon thought this name to be rather dull, so Solomon, Burawa, and John McVeigh decided that: "It's a stellar event, so let's name it after a star." McVeigh suggested "Altair", the twelfth-brightest star in the sky.[29][30]

When the January 1975 issue of *Popular Electronics* reached readers in mid-December 1974, MITS was flooded with orders.[31] They had to hire extra people just to answer the phones. In February, MITS received 1,000 orders for the Altair 8800. The quoted delivery time was 60 days, but it was many more months before the machines were shipped. By August 1975, they had shipped over 5,000 computers.[32]

The Altair 8800 computer was a break-even sale for MITS. They needed to sell additional memory boards, I/O boards, and other options to make a profit. The April 1975 issue of the MITS newsletter *Computer Notes* had a page-long price list that offered over 15 optional boards.[33] The delivery time given was 60 or 90 days, but many items were never produced and dropped from future price lists. Initially, Roberts decided to concentrate on production of the computers. Prompt delivery of optional boards did not occur until October 1975.

There were several design and component problems in the MITS 4K Dynamic RAM board. By July, new companies such as Processor Technology were selling 4K Static RAM boards with the promise of reliable operation.[34] Ed Roberts acknowledged the 4K Dynamic RAM board problems in the October 1975 *Computer Notes*. The price was reduced from $264 to $195 and existing purchasers got a $50 refund. MITS released its own 4K Static RAM board in January 1976.

Several other companies started making add-in boards and the first clone, the IMSAI 8080, was available in December 1975.[35]

Altair BASIC[edit]

Main article: Altair BASIC

Bill Gates was a student at Harvard University and Paul Allen worked for Honeywell in Boston when they saw the Altair computer on the cover of *Popular Electronics*. They had previously written software for the earlier Intel 8008 microprocessor and knew the Intel 8080 was powerful enough to support a BASIC interpreter. They sent a letter to MITS claiming to have a BASIC interpreter for the 8080 microprocessor. Roberts was interested, so Gates and Allen began work on the software. Both had experience with the Digital Equipment Corporation PDP-10 minicomputers that they would use. Allen modified the DEC Macro Assembler to produce code for the Intel 8080 and wrote a program to emulate the 8080 so they could test their BASIC without having an Altair computer. Using DEC's BASIC-PLUS language as a guide, Gates determined what features would work with the limited resources of the Altair computer. Gates then started writing the 8080 assembly-language code on yellow legal pads. In February Gates and Allen started using a PDP-10 at Harvard to write and debug BASIC. They also enlisted another Harvard student, Monte Davidoff, to write the floating-point math routines.[36]

Altair 8K BASIC on paper tape. Bill Gates gave Paul Allen a paper tape containing BASIC to take to MITS.

Paul Allen flew to Albuquerque, New Mexico, in March 1975 to test BASIC on a real Altair 8800 computer. Roberts picked him up at the airport in his pickup truck and drove to the nondescript storefront where MITS was located. Allen was not impressed. The Altair computer with 7 kB of memory that BASIC required was still being tested and would not be ready until the next day. Roberts had booked Allen in the most expensive hotel in Albuquerque and the room was $40 more than Allen brought with him. Roberts paid for the room and wondered who is this software guy who can not afford a room in a hotel.[37]

The next day the Altair with 7 kB had finally passed its memory test and Allen had their BASIC interpreter on a paper tape Bill Gates had created just before Allen left Boston. It took almost 15 minutes for the Teletype to load the program into the Altair then the Teletype printed "MEMORY SIZE?" Allen entered 7168 and the Teletype printed "READY". Both Allen and Roberts were stunned their software and hardware actually worked. They entered several small programs and they worked. The BASIC interpreter was not complete and crashed several times, but Roberts had a high level language for his computer. Roberts hired Allen as Vice President and Director of Software at MITS.[38][39] Bill Gates also worked at MITS; the October 1975 company newsletter gives his title as "Software Specialist".[40]

Bill Gates remained at Harvard, but continued working on BASIC. Students were allowed to use the DEC PDP-10, but officials were not pleased when they found that Gates was developing a commercial product. The school then implemented a policy that forced Gates to use a commercial time share service to work on BASIC.[41]

On July 22, 1975, MITS signed a contract for the Altair BASIC with Bill Gates and Paul Allen. They received $3,000 at signing and a royalty for each copy of BASIC sold, with a cap of $180,000. MITS received an exclusive worldwide license to the program for 10 years. They also had exclusive rights to sublicense the program to other companies and agreed to use its "best efforts" to license, promote and commercialize the program. MITS would supply the computer time necessary for development on a PDP-10 owned by the Albuquerque school district.[42]

MITS realized that BASIC was a competitive advantage and bundled the software with computer hardware sales. Customers who purchased the computer, memory, and I/O boards from MITS could get BASIC for $75; the standalone price was $500. Many hobbyists purchased their hardware from a third-party and "borrowed" a copy of Altair BASIC. Roberts refused to sub-license BASIC to other companies; this led to arbitration in 1977 between MITS and the new "Micro-Soft". The arbitrator agreed with Microsoft and allowed them to license the 8080 BASIC to other companies. Roberts was disappointed with this ruling. Since both Allen and Gates had been employees of MITS and he paid for the computer time, Roberts felt it was his software.[43]

Sale to Pertec[edit]

In 1976, MITS had 230 employees and sales of $6 million.[44] Roberts was tiring of his management responsibilities and was looking for a larger partner. MITS had always used Pertec Computer Corporation disk drives[45] and on December 3, 1976, Pertec signed a letter of intent to acquire MITS for $6 million in stock.[46] The deal was completed in May 1977 and Roberts' share was $2–3 million.[6][47] The Altair products were merged into the Pertec line, and the MITS facility was used to produce the PCC-2000 small-business computer. The Albuquerque plant was closed in December 1980 and the production was moved to the Pertec plants in Irvine, California.[48]

Medical doctor[edit]

In late 1977 Roberts returned to rural Georgia and bought a large farm in Wheeler County where he had often visited his grandparents' home in his youth.[6][49] He had a non-compete agreement with Pertec covering hardware products, so he became a gentleman farmer and started a software company. His age could have thwarted his dream of becoming a medical doctor, but nearby Mercer University started a medical school in 1982. Roberts was in the first class and graduated with an M.D. in 1986. He did his residency in internal medicine and in 1988 established a practice in the small town of Cochran, Georgia.[6][50][51] In 2009, Dr. Roberts was elected to Alpha Omega Alpha, the medical honor society. He was nominated by Mercer alumnus Guy Foulkes, MD based on Roberts' dual accomplishment of developer of the first personal computer and his devotion to rural medicine.

Personal life[edit]

Roberts married Joan Clark (b. 1941) in 1962 and they had five sons, Melvin (b. 1963), Clark (b. 1964), John David (b. 1965), Edward (b. 1970), Martin (b. 1975) and a daughter Dawn (b. 1983). They were divorced in 1988.[1][6][52]

Roberts married Donna Mauldin in 1991 and they were still married when interviewed by *The Atlanta Journal-Constitution* in April 1997.[1] He was married to Rosa Cooper from 2000 until his death.[53]

Roberts died April 1, 2010 after a months-long bout with pneumonia, at the age of 68.[54][55] His sister, Cheryl R Roberts (b. November 13, 1947 – d. March 6, 2010), of nearby Dublin, Georgia died at age 62, a few weeks before his death.[56] During his last hospitalization in Macon, Georgia, hospital staffers were stunned to see an unannounced Bill Gates, who had come to pay last respects to his first employer. He was survived by his wife, all six of his children and his mother, Edna Wilcher Roberts. All live in Georgia.[57]

SOLOMON'S MEMORY (by Les Solomon - atariarchives.org/)

[HW004Z][GDrive]

Les Solomon is technical director of Computers & Electronics. He is a member of the Bug-Eyed Monster Society and practices levitation in his spare time.

[HW0050][GDrive]

Les Solomon

When Popular Electronics ran its first cover story on the Altair in January 1975, 1 was the technical director for the magazine and therefore fortunate enough to witness and aid in the birth of the personal/ home computer. Before those early years become set in stone, I would like to offer this reminiscence and give credit to those pioneers whose names may be unknown to the home computer users now benefiting from the fruits of their labors.

It all started for me in the summer of 1972, during a vacation trip out west. My wife and I were near Albuquerque when I called Forrest Mims, a contributor to the magazine who lived in this town out in the middle of nowhere. His father had a small company called M. I. T. S. (Micro Instrumentation and Telemetry Systems), which occupied the bathroom of Forrest's mobile home and manufactured small electronic gadgets for radio-control airplanes and model rockets.

The Mims invited us out to see them, and during the conversation Forrest mentioned that he had a friend who was as crazy about electronics as I was. He insisted that I meet this fellow, Ed Roberts, so later that night we got together in a steak bar in downtown Albuquerque. Just out of the military, Ed had this idea about offering an electronic calculator kit. And I had to listen, since he stands over six feet and weighs 235 pounds or so.

Anyway, I decided to write about the kit in the pages of Popular Electronics. After the article appeared, many kits were sold and Ed bought out M.I.T.S., moved it into a real building and dropped the periods to make it MITS. Pretty soon, everybody and his uncle got into calculators and they were a dime a dozen. Ed was giving serious thought to folding his company when we heard some electronic stirrings that sounded really wild. One of our competitors, Radio-Electronics, was preparing a story on a "computer" using an Intel 8008 microprocessor chip. Ed looked into it, obtained an even newer Intel chip called the 8080, and with a couple of engineering friends set about creating his own computer.

The MITS computer was ready that summer. Ed said it could be sold as a kit for about $400, which was fantastic since I knew the Radio-Electronics Mark-8 computer was having difficulties (no peripherals, no language, etc.). One day he phoned to say his first computer was being shipped to me by Railway Express Agency. A week later, no computer had arrived. I complained to the people at REA, who retorted: "Our computer has never lost anything!" During the fourth week they went bankrupt, having lost not only the first MITS computer but their entire shipping empire as well.

Luckily, Ed had sent me another computer by a different route. There I was, in a small office in New York with a metal box marked PE-8 on my desk, and an ASR-33 Teletype as the only way of inputting or displaying instructions and data. Between the frontpanel switch start-up routine and the noisy Teletype, I was told to take "that thing" home, which I suppose made the PE-8 the first workable home computer.

Art Salsberg, my boss, said he would go along with me on publishing a construction article on a microcomputer ("Heaven only knows who will build one!"), so the next step was finding a catchy name for our 8-bitter. After dinner one night I asked my twelveyear-old daughter, who was watching Star Trek, what the computer on the Enterprise was called.

"Computer," she answered.

That's a nice name, I thought, but not sexy. Then she said:

"Why don't you call it Altair? That's where the Enterprise is going in this episode."

[HW0051][GDrive]

THE FIRST DO-IT YOURSELF PERSONAL COMPUTER

Titled simply "Computer," with the subhead "Build the Mark-8, Your Personal Minicomputer," RadioElectronic's cover story for July 1974 introduced the first homemade machine to use a microprocessor.

My introduction to the Mark-8 came one bright spring morning in 1973, when a forceful young man by the name of Jonathan Titus called to tell me about his working model of a microcomputer built around the new Intel 8008. (A bargain-priced 8008 microprocessor cost $125 at the time.) Deciding that a personal visit was necessary, I flew down to Blacksburg, Virginia, where Jon took me to a spare room in his college apartment and showed me the first micro system: a little green box decorated with a bunch of toggle switches and flickering red lights.

What, I wondered, would anyone do with a computer that needed to be programmed ... one step at a time ... by setting eight toggle switches to represent each instruction?

Despite my misgivings and after months of preparation, we published our article on the Mark-8 computer. There was no way we could squeeze it into a single issue, and for the second time in our history we offered a booklet of complete construction information. The booklet sold by the thousands: each new stack that came in from the printer was gone in no time, and we'd have to order more. To this day I don't know how many people spent how many hours entering instructions and data into the Mark-8 ...

I am often asked whether I anticipated the current personal computer revolution when I was introduced to Jon Titus' original micro system. My answer is yes, but I still don't think the computer is the ideal tool for everyone. In business and education there is no doubt that its growth as a tool and as a time- and dollar-saver will continue. When it comes to computers in the home, however, I have my doubts.

I am not convinced that the average person has enough need for a computer to justify its cost. Yes, it's a great game machine. Yes, it's a great educational device. Yes, it's a great typewriter. But unless you're going to do your banking, control your home appliances, keep your holiday mailing lists, calculate your income taxes and your budget, it's difficult for me to see a personal computer in every household. Until the price of hardware comes down, and until software exists at low cost to do the kinds of things the average American needs done around the home, the computer revolution will remain largely a business revolution.

LARRY STECKLER, publisher of Radio-Electronics

The next day I called Ed to try out the new name. His answer was curt: "I don't care what you call it, if we don't sell two hundred we're doomed!" So Altair it became.

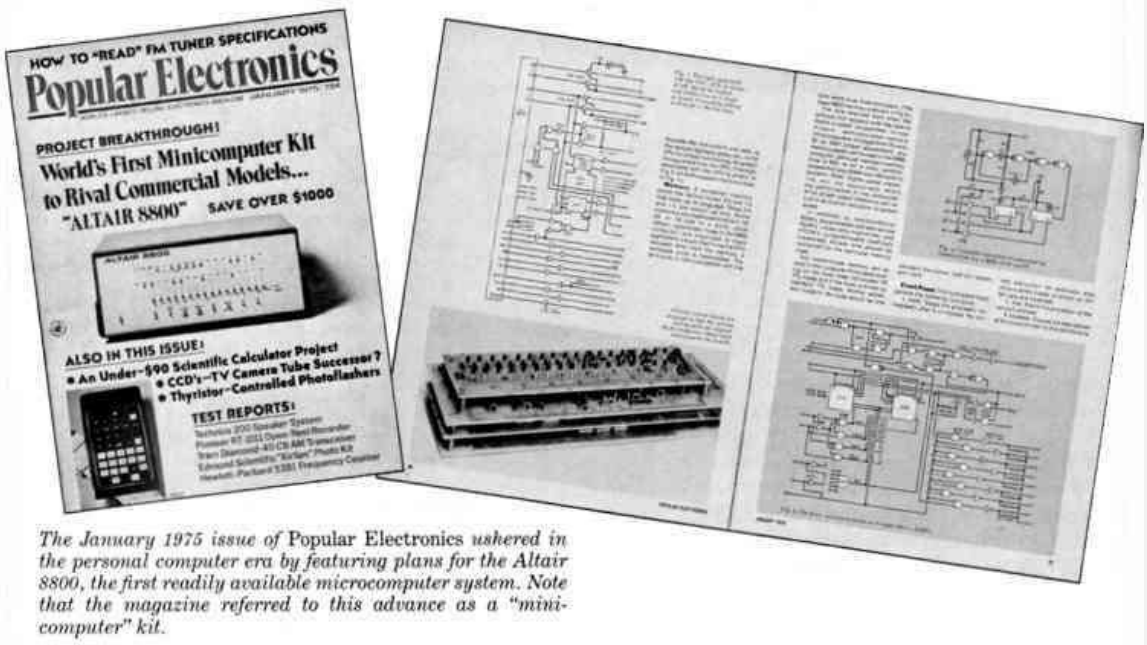
About a month before we ran the Altair story I had a visit from another imposingly large person, Roger Melen of Stanford University, who had written several articles for us. Roger contemplated the Altair set up on the table, and when I told him it was a computer his eyes glazed over. He muttered something about getting one for himself and his friend Harry Garland, who also wrote for us, and asked me for the name and address of the kit supplier. Then he vanished. Later I heard he took the next plane to Albuquerque, marched into Ed's office and bought Altair #2 right off his desk.

A few months later I got a call from Roger, asking me to fly out to San Francisco to see something very important. When I got there, he took me to the apartment he shared with Harry and showed me what he'd done with his Altair. Plugged into the machine was a double set of add-on circuit boards called the Dazzler, whose video output could create an amazing display on a color TV-the first plug-in expansion board for a personal computer. The software was called Kaleidoscope, a program that is relatively common today, but in 1976 ... ! Because of its ever-changing color display, Kaleidoscope would actually become a traffic stopper: Stan Veit ran the program all night in the window of his New York store, the first computer store east of the Mississippi, and the NYPD had to put an end to it because people kept slowing down to gawk at all those color images.

Dazzler sales went over so well that Roger and Harry formed a new company to manufacture Altair plug-ins. They decided to name it after Crothers Memorial Hall, where they had lived during their undergraduate days at Stanford. Cromemco (Crothers Memorial Company) was the first of what would become an entire subindustry of firms manufacturing add-ons to extend the capabilities of existing personal computers.

At about this time MITS held the world's first microcomputer convention, called, strangely enough, the World's First Altair Convention. Located in the Airport-Marina hotel in sunny downtown Albuquerque, it was attended by an amazing number of people who came from all over the country to see what was going on.

The Altair was a success, but the paper tape BASIC and paper tape software were an abomination. One day Jerry Ogdin, a computer consultant, had come to me with the idea of storing digital data using two tones (one for a zero, another for a zone) on an ordinary voice-grade tape cassette recorder. In September of 1975 we ran a construction article on what we called HITS (Hobbyists' Interchange Tape System), after which a number of manufacturers started using their own approach to two-tone data recording. Wayne Green, who had just started Byte magazine, wanted all the manufacturers to get together in a neutral site and hammer out a cassette standard. The site picked was Kansas City, Missouri. We all met for a weekend, and after many loud and serious discussions the Kansas City tape "standard" was born. Unfortunately, it didn't last long; before the month ended, everyone went back to his own tape standard and the recording confusion got worse.



The January 1975 issue of Popular Electronics *ushered in the personal computer era by featuring plans for the Altair 8800, the first readily available microcomputer system. Note that the magazine referred to this advance as a "mini-computer" kit.*

[HW0052][GDrive]

THE RISE AND FALL OF THE ALTAIR

Though computer kit makers like Scelbi Computer Consulting, RGS Electronics and Martin Research actually preceded MITS, the Altair 8800 with its 5100 bus and Microsoft BASIC became the foundation of the personal computer industry. More Altairs were sold than any single computer ever designed up to that time (including the famous IBM 360).

Why, then, isn't MITS one of today's industry leaders? Well, perhaps because its founder, Ed Roberts, was a better engineer than businessman.

When MITS struck it rich with the Altair, the small staff-less than ten people-geared up to handle the hundreds of orders that poured in. They set up manufacturing operations, software development and customer service, and even published one of the first computer magazines, Computer Notes. But problems arose because no one had ever made as many computers of one type. MITS had neither the experience nor its own capital to do the job, and in those days there were no venture capitalists breaking down doors to offer development money. Further, though computer hobbyists and potential dealers helped out with prepaid orders, Ed Roberts made some serious marketing errors. For example, MITS insisted that Altair dealers carry no other line of computers: "Ford dealers only carry Fords," Roberts declared, "and Altair dealers will only carry Altairs." When MITS could not deliver the computers, many dealers went out of business or dropped the Altair line.

MITS eventually did produce the Altair 8080B, a really fine computer with a good disk system and lots of good software including business applications. The company never solved its cash flow problems, however, and eventually Ed Roberts sold out to the Pertec Computer Co., which supplied the Altair disk drives. Ed retired from the computer industry to raise pigs in Georgia, then later decided to go to medical school.

Pertec, which had ambitions to become a major computer company, felt the name Altair was too identified with "hobby computers." The line was discontinued, and the Altair vanished from the market. When Pertec was itself bought out by Adler of Germany, the Altair name was condemned to oblivion. All that was left was Microsoft BASIC and the memory of the machine that started an industry.

STAN VEIT

It was at Kansas City that I first met Bob Marsh, who had formed a garage-based company in San Francisco called Processor Technology. Along with circuit designer Lee Felsenstein, he was making Altair memory boards and a graphics display board called the VDM-1, also for the Altair. Lee had worked for Marty Spergel, the driving force behind M&R Enterprises, and came through with plans for the Pennywhistle modem-the first hobby modem, published in our March 1976 issue. Now we computer hobbyists had a low-cost way to communicate over the telephone lines. Lee went on to design several trend-setting computers, including the portable Osborne.

I was still unhappy. The Altair needed a video display terminal with a self-contained keyboard. Like everyone else, I had been constantly startled by Don Lancaster's brilliant innovations over the years, and I knew he had just finished his TV typewriter. I went to Phoenix, loaded Don and his typewriter into the car, and took off for Albuquerque and MITS. One thing I must say for Don Lancaster and Ed Roberts: they both have very strong personalities. When I got them together in Ed's office, the clash was pretty fierce. Since the Altair and the TV typewriter were not compatible, something had to give. Neither man, however, would give an inch.

My next step was to talk to Bob Marsh of Processor Technology. It took a little doing, but I finally convinced him that a combination of his memory boards, his VDM-1 as the video display, plus an 8080, a power supply and the S-100 bus, would make a dandy "smart" terminal-or even a computer. We decided on the smart terminal approach, since I was fairly certain the magazine would not "buy" another computer. Lee Felsenstein did the preliminary design and, using one of Don Lancaster's approaches, came up with a computer. Steve Dompier and Gary Ingram did the software. Another software person, Gordon French, came up with the idea of wooden sides for the case-an odd first for computers.

In the summer of 1976 a new, easier-to-use computer was born, one with a self-contained operating system (no complex switches to get it started), built-in video capability, an integral keyboard and a small, typewriter-size enclosure. It was decided that this new approach would be called Sol. The story I was told by Marsh and Felsenstein was that if the strangelooking computer didn't fly, they had to have someone to blame it on ... guess who? At least they didn't call it the Les. Sol appeared in the July 1976 issue of Popular Electronics.

That summer there was also the famous Atlantic City Computer Conference at the snazzy Shelbourne Hotel/Motel. This was just about the first time almost all the microcomputer people got together in one place. It was a great show and the forerunner of the many computer fairs to follow.

During the 1977 First West Coast Computer Faire, I dropped in on the Heuristics Company to see what Horace Enea had wrought. His Speechlab plugin board would allow the user to actually talk to the computer, and the computer could "understand"! Not too much later Software Technology, an offshoot of Processor Technology, came up with a variation of Steve Dompier's music system (Dompier was the first to realize that microcomputers could make music) and produced a most marvelous sound system that was used in conjunction with an external audio amplifier. From now on, no microcomputer show would be silent!

The 1977 First West Coast Computer Faire (Jim Warren, chairperson) was a success in many ways. It was one of the first times such a wide variety of computer people got together in one place on the West Coast. Outside the Brooks Hall site of the show was parked a small van containing Mike Wise and his unique computer from the Sphere Company located in Bountiful, Utah. The one thing we remember about the Sphere was that its BASIC was s-1-o-w. Real s-1-o-w! The Sphere computer was never seen again: it was advertised and a couple were even delivered to computer stores, but very soon Sphere vanished from the face of the earth-a fate shared by many other pioneering computer models.

There were a lot of other developments over the years, some good, some transitory, none of them boring. Companies came and went, as did software. (Does anyone remember Target, the first personal computer game? Or Star Trek, with its umpteen versions?) Magazines also came and went. (Anyone remember ROM, with its column "From the Fountainhead" by a young writer named Adam Osborne?) Processor Technology vanished along with the late, great Sol and the unlamented Helios disk drive; Steve Jobs and Steve Wozniak came up with Apple I, a computer on a single circuit board that would lead to bigger things; Bob Suding of the Digital Group out in Denver came up with some good hardware, unfortunately too far ahead of its time.

A couple of guys in New Jersey, Roger Amidon and Chris Rutkowski, came up with a "supercomputer": the General, with its superb software. Although the General also soon folded its tent, the idea of this machine recently returned when Roger and Chris, using the Rising Star marketing firm as a base, introduced the Epson QX-10 with Valdocs word processing software-the most user-friendly computer system I've seen as of this writing and, incidentally, the machine I used to compose this account.

This just about brings me to the end of my musings about "the good old days"-to the end of 1977, just two years after the Altair. I personally don't believe we shall ever again see such an outburst of raw talent. They were great times. (If I missed any important event or name, forgive me, fellows, I am getting old.) I salute that long-haired, blue-jeans-and-T-shirt bunch, bearded or not shaven at all, fueled by hamburgers and Anchor Steam beer (I didn't forget, Steve), limited only by their imagination. They left the legacy that a handful of guys with an idea can change the world ... because that's exactly what they did. Just look around.

[HW0053][GDrive]

Come A Long Way

The horse-and-buggy days of home computing were not all that long ago. In fact, less than a decade has passed since I first read about the Altair and began thirsting-nay, lusting-for a computer of my own.

When I finally got one, of course, there was precious little I could do with it. My Altair turned out to be just a box with toggle switches and neat rows of red LEDs (light-emitting diodes) decorating the front panel. The switches were its only input device; the LEDs were its output, glowing and darkening in patterns that showed what you had input from the switches and what the computer had done as a result. Both operated at the same simple-minded level as the computer itself, in binary numbers built up of 1s and 0s. A "1" was entered by raising a switch, a "0" by lowering it. The corresponding LEDs glowed for each "1" and darkened for each "0."

A one-byte program instruction, nothing more arduous than STOP, took eight switch settings.

The Plug-In Problem

Luckily, there was a world beyond the binary level. I went out and got a "terminal," with keyboard and video display screen, but then found nothing on the Altair to plug it into. What I needed was an I/O (input/ output) circuit board through which the computer and terminal could communicate. The Altair had about a dozen slots where you could plug in I/O and other boards. Put a 25-pin connector into one of the oval holes in the computer's back, run a cable from the I/O board, and you had a place to plug in the terminal.

Problem: typing on the terminal had no effect on what the Altair did. Just as nice children don't speak until they're spoken to, computers don't communicate with terminals until a program has told them they can and how to do it. There was such a program in octal (base-8) numbering that you could translate into binary and toggle in from the front panel of the Altair. Unfortunately, the program was several hundred bytes long; at eight bits per byte, this meant well over a thousand switch-flicks before the program was in the machine. Since a computer's random access memory becomes amnesiac the instant its power is shut off, you'd have to toggle in that program every time you wanted to use the machine. And if you made just one of those thousand switch-flicks wrong, the program wouldn't run-or would run amok, randomly changing the bits you'd toggled in correctly.

The solution was to put that program, and any others you needed regularly, into an EPROM (erasable, programmable, read only memory), which would hold its contents even when the computer was shut off. A whole set of such programs fit easily into just two EPROM chips. Naturally the Altair had no place to plug in those chips, so I had to buy a Cromemco Bytesaver board to hold them and plug it into the Altair's bus. With those programs, typing in instructions like C2 D5 01 ("If the zero flag is not set, jump to the program steps at memory location 01D5") was simpler than setting switch sequences of 11000010 1101010 00000001. Writing programs in tiny steps of arbitrary symbols, however, was still infuriatingly slow. What I needed was a "high-level" programming language.

By that time the Altair could run an abbreviated BASIC, the first product of a tiny new firm called Microsoft. It was only available on punched paper tape, which required a special paper-tape reader, but for once I didn't have to buy any new equipment. I had a friend with a teletype-a printing terminal that could also read and punch such tapes. I ordered BASIC and my friend read it into his machine, then rerecorded it onto a tape cassette. I might not have a paper-tape reader, but I did have a cassette recorder.

Still Plugging Away

Not surprisingly, the Altair had no place to plug in the cassette. Now what I lacked was a board that would translate between computer and cassette deck. With this I would have a fully functioning system, including all the major parts a computer needs: a keyboard and screen (on the terminal), mass storage (the cassette), a processor, and both ROM (built-in program) and RAM (user-programmable) memory. But the Altair came with 4K of RAM memory and the BASIC interpreter took up 8K, not counting the program you then wanted to run. The solution here was to plug in still more memory boards.

In those early days, few programs were readymade, in part because not all the programs marketed for the Altair were available in the same tape format. Besides, there simply weren't that many to choose from. Then along came the next generation of personal computers: machines like the Radio Shack TRS-80 Model I, the Commodore PET and the Apple II, with resident programs in permanent memory, cassette connections, keyboards and (save for the Apple) screens built in. Not only that, but they had BASIC built in, so you could run your language immediately-no waiting while you loaded it from a tape.

In principle, they were little different from my old Altair. The major difference was that these computers didn't require months of learning and searching for parts before you could use them. All you had to do was plug them in …

Profiles / Bio

Profile of Dr. Thomas Monath (Jan 2014) from One Health Platform

***Thomas P. Monath, MD Biography:** Source : [HI0029][GDrive]

Dr. Thomas P. Monath, a physician, is a consultant to the biotechnology industry. He is currently Chief Scientific and Chief Operations Officer of Newlink Genetics Corporation's wholly-owned subsidiary, BioProtection Systems Corp. and is helping determine if the Canadian/NewLink Ebola vaccine candidate will provide part of the solution to one of the world's biggest public health challenges. He was formerly Chief Medical Officer of Hookipa BioTech AG and Chief Technical Officer of PaxVax Inc, where he was also engaged in development of new vaccines. His expertise and experience cut across discovery research, process and analytical development, manufacturing, preclinical and clinical development, and regulatory affairs. Monath is also a Venture Partner at Kleiner Perkins Caufield & Byers and is a Director of Sentinext plc, Rapid MicroBiosystems Inc, and U.S. Biologics Inc.

Between1992-2012 he was Adjunct Professor, Harvard School of Public Health. Between 1992 and 2006. Dr. Monath was Chief Scientific Officer and an Executive Director, Acambis plc (a publicly traded biopharmaceutical company recently acquired by Sanofi Pasteur) where he pioneered the development of ChimeriVax® vaccines against dengue, West Nile, and Japanese encephalitis (using yellow fever as a live vector), vaccines against yellow fever, Clostridium difficile, and Helicobacter pylori, as well as a cell based smallpox vaccine, ACAM2000 which has now replaced calf lymph vaccine in the US national stockpile. The JE vaccine (IMOJEV®) is licensed in multiple countries; the West Nile vaccine (Prevenile®) is licensed for use in horses; and the dengue and C. difficile vaccines are in Phase III trials.

Dr. Monath received his undergraduate and M.D. degrees from Harvard and trained in internal medicine at the Peter Bent Brigham Hospital, Boston. COL Monath retired from the US Army in 1992 after 24 years in the uniformed services (Army and U.S. Public Health Service). Between 1973-1988, he was Director, Division of Vector-Borne Viral Diseases, U. S. Centers for Disease Control (CDC), Fort Collins CO and from 1989-92 Chief, Virology Division, U.S. Army Medical Research Institute of Infectious Diseases (USAMRIID). He has worked overseas in Nigeria, Sierra Leone, Cameroun, Argentina, Ecuador and elsewhere doing field research on arboviruses and hemorrhagic fevers. In 1972, he discovered the rodent reservoir of Lassa fever virus. He is on the editorial board of 5 scientific journals.

He received the Nathanial A. Young Award (1984), the Richard M. Taylor Award (1996), and the Walter Reed Medal (2002) from the American Society of Tropical Medicine & Hygiene and was President of that Society (2004-05). He has served on numerous government and international committees on infectious diseases, biosecurity, World Health Organization expert committees and the National Vaccines Advisory Committee (USA). From 1998-2000, Monath was Senior Science advisor to the Director, Central Intelligence Agency. Dr. Monath has published 400 papers and 6 books on the epidemiology, immunology and pathogenesis of arboviruses and on vaccine development.

A leader in the "One Health" movement, Dr. Monath served on the American Veterinary Medical Association's "One Health" Task Force and subsequently the One Health Commission (USA). He currently co-manages the One Health Initiative website http://www.onehealthinitiative.com with Laura H. Kahn, MD, MPH, MPP, Bruce Kaplan, DVM, Jack Woodall, PhD and Lisa A. Conti, DVM, MPH. Dr. Monath co-edited a unique 'first of its kind' One Health monograph in the Veterinaria Italiana Journal's 2009 - Volume 45 (1), January-March http://www.izs.it/vet_italiana/2009/45_1/45_1.htm with Drs. Kahn and Kaplan. They also co-authored the introductory chapter to the 2010 One Health book "Human-Animal Medicine – Clinical Approaches to Zoonoses, Toxicants and other Shared Health Risks" http://www.us.elsevierhealth.com/product.jsp?isbn=9781416068372 and co-edited the 2014 One Health book "Confronting Emerging Zoonoses – The One Health Paradigm" http://www.springer.com/978-4-431-55119-5 with Akio Yamada, DVM, PhD and the One Health Initiative team.

Profile of Dr. Thomas Month, from GeoVax.com

https://www.geovax.com/component/tlpteam/team/thomas-p-monath-md

Thomas P. Monath, MD, Chairman

Dr. Monath currently serves as Managing Partner and Chief Scientific Officer of Crozet BioPharma LLC. He was formerly Chief Scientific Officer and Chief Operating Officer of BioProtection Systems, a subsidiary of NewLink Genetics Corporation, where he led the development of an Ebola virus vaccine in partnership with Merck. Prior to joining NewLink, Dr. Monath held various industry roles at PaxVax Inc., Hookipa Biotech AG, Juvaris Inc., Xcellerex Inc., and Acambis Inc. prior to its acquisition by Sanofi Pasteur. In these roles, he led the development of a broad array of vaccines, including those against influenza, dengue, Japanese encephalitis, West Nile, yellow fever, cytomegalovirus, and smallpox viruses, as well as against Helicobacter pylori and Clostridium difficile; four of these are now licensed.

He is a former partner of the Pandemic and Bio Defense Fund at Kleiner Perkins Caufield & Byers, a leading venture capital firm with a strong life sciences practice. He joined the biotechnology industry following a 20-year career at the U.S. Army Medical Research Institute of Infectious Diseases and the CDC's Division of Vector-Borne Infectious Diseases. Dr. Monath received his undergraduate and medical degrees at Harvard, was awarded virology fellowships at the University of Ibadan in Ibadan, Nigeria, and at Massachusetts General Hospital in Boston, MA and completed residencies in medicine at Peter Bent Brigham Hospital in Boston.

His published work includes over 425 papers and 6 books in the field of virology and vaccine development.

2001 (summer) book - "Death in the Air: Globalism, Terrorism, and Toxic Warfare" by Dr. Leonard Horowitz

The whole of chapter (7/8) - West Nile

Video Recordings : Part 1 = [HB005P][GDrive] / Part 2 = [HB005Q][GDrive] / ...

Chapters 7 and 8 PDF w/ OCR : Focus onWest Nile (pages 091 to 113) : [HB005U][GDrive]

Product Description (Dr. Horowitz released this book in June, 2001, 3-full months before the 9-11 "attack on America." Consider the prophetic title!)

Silently killing us, our family and friends, the global plagues and toxic menaces are here, yet where are you? If you are like most Americans, you've become distracted by pastimes, passions, pleasures and psycho-sensory over-stimulation. The "Technotronic Era" is here. With it comes a New World of "non-lethal" biological and chemical weapons, and warfare applications, that are being waged against defenseless civilians. Regardless of what you now think, you are being manipulated and lethally affected, and this intelligence may be crucial to you and your family's survival. Death in the Air: Globalism, Terrorism and Toxic Warfare (ISBN: 0-923550-30-5) delivers the most heretical message in the annals of world health and American medicine, backed by the most astonishing hard-hitting documents ever revealed. Here, veteran investigator, Dr. Len Horowitz, the award-winning author of the national bestseller, Emerging Viruses: AIDS & Ebola: Nature, Accident or Intentional? relays how and why populations are being insidiously victimized. Exquisitely detailed in this book are the most advanced developments in the field of population control. Genetically engineered viruses and bacteria, the latest technologies for biological warfare, and combined exposures to biochemical, metallic, and electromagnetic agents, offer a "Star Wars"-like arsenal for conducting global genocide auspiciously for "public health", "National Security", and "world peace".

Apparent Origin of the Weaponized Anthrax-The Chief Suspects

21. In April, 1998, OraVax/Acambis Vice President, Dr. Thomas Monath met with President Clinton, New York's Emergency Management Director, Jerry Hauer, Rockefeller University president emeritus and American Type Culture Collection (ATCC) curator, Dr. Joshua Lederberg, CIA Director John Deutsch, and government biological weapons expert William C. Patrick, III, to discuss/negotiate the first of several multimillion dollar anthrax, smallpox, and West Nile virus vaccine contracts. According to New York Times reporters William Broad and Judith Miller,(37) "seven scientists endorsed the stockpile." These included "two men who stood to gain financially from the decision. . . ." These men included Dr. Monath and Dr. J. Craig Venter, president of The Institute for Genomic Research near Washington working on anthrax genetics. "The apparent consensus on acquiring vaccines masked deep divisions among scientists and military officials," according to the Times reporters.(10,37)

Encephalitis outbreak claims 5

ATLANTA (AP) — Five people have died in an outbreak of mosquito-borne encephalitis that has struck at least 16 people in four states, the national Centers for Disease Control reports.

Two forms of the brain disease — Eastern equine encephalitis and California encephalitis — have been reported in people in Georgia, Florida, New York and Wisconsin, the CDC said Thursday in its Morbidity and Mortality Weekly Report.

The outbreak has led to the death of one person in south Georgia, one in central Florida and three in New York — two in Albany County and one on Long Island, the CDC said.

"There is no specific treatment, no drug, so that once a patient has acquired it, the only thing you can do is provide general nursing and supportive care," said Dr. Thomas Monath, director of the CDC's vector-borne viral diseases division.

In July, Eastern encephalitis struck two south Georgia residents, a Lowndes County woman in her 40s who died from the disease and a 2½-year-old Brantley County boy who recovered, health officials said. Five Georgia children, aged 3 months to 10 years, had California encephalitis, the CDC said.

In Orlando, Fla., a 75-year-old man died from the disease, which struck in June, the CDC said.

New York has reported seven cases of California encephalitis, one of which was confirmed. The disease claimed the lives of three people, two Albany County residents, ages 45 and 79, and an 06-year-old Long Island resident.

In Wisconsin, one confirmed case of La Crosse encephalitis, a type of California encephalitis, has been reported in a 10-year-old girl.

Eastern equine encephalitis, which affects people and animals, has a death rate of 50 percent to 70 percent, and many of those who survive suffer permanent neurological damage, including mental retardation, psychological problems and paralysis, Monath said.

Symptoms range from headache and fever to seizure and loss of memory and motor skills.

Large swarms of mosquitoes, spawned by heavy summer rains, are spreading the disease in the Southeast, said Dr. David Bedell, a veterinarian with the Georgia Cooperative Extension Service.

"It's a pitiful disease," said Dr. Harold Kjar, a veterinarian with the Auburn University Extension Service in Alabama. Horses infected by Eastern equine encephalitis "stagger, go blind and wander around," he said.

California encephalitis, generally a milder form of the disease, usually strikes children and does not affect animals.

Eastern equine encephalitis has resulted in the deaths of at least 70 horses in a 32-county area of central and south Georgia this year, Bedell said. Caged quail and pheasants on six Georgia farms have been affected, resulting in more than 4,000 deaths, mostly among young birds.

About 150 horse cases have been reported in north and central Florida, compared to eight cases last year, the CDC said.

Other states reporting mosquito-borne encephalitis in animals, but not humans, include Alabama, Arizona, California, Colorado, Texas, Maryland, North Dakota and South Carolina, health officials said.

St. Louis encephalitis has been reported in young wild birds in Kentucky, Mississippi, Ohio and Tennessee, the CDC said.

U.S., Soviets OK vaccine research pact

Associated Press

FREDERICK, Md. — The U.S. Army has signed a pact with Soviet scientists to develop a vaccine to combat hemorrhagic fever, a deadly disease found in Asia, the Soviet Union and elsewhere, the military said Wednesday.

It is the first agreement of its kind between Army medical researchers and a Soviet scientific agency.

Army scientists have developed a vaccine they believe will work against hemorrhagic fever with renal syndrome. Under the agreement, Soviet scientists will work with them to refine the vaccine and test it on thousands of volunteers.

"This kind of collaboration is another confirmation of the openness that is developing and the willingness to draw closer together on scientific matters and other things," said Col. Thomas Monath, chief of virology at the U.S. Army Medical Research Institute of Infectious Diseases.

For ulcers, end of line may be near

GLOBE STAFF PHOTO/PAT GREENHOUSE

With screening tests and an effective vaccine, "you could eliminate peptic ulcer disease from the population."

DR. THOMAS MONATH
Vice president, Oravax, Inc.

By Richard Saltus
GLOBE STAFF

Stomach ulcers, the painful ailment that until recently was wrongly linked to the stresses of modern life, could be headed the way of polio and smallpox if a preventive vaccine bears out its early promise, say researchers.

Now that even skeptics agree that most ulcers are caused by a common bacterial infection, not by diet or stomach acid or an oppressive boss, the stage appears set for their virtual eradication.

"You could eliminate peptic ulcer disease from the population" by combining screening tests with an effective vaccine, said Dr. Thomas Monath, formerly an infectious disease specialist with the US Army and now vice president for research at OraVax, Inc., in Cambridge. (Peptic ulcer disease is the medical term for what lay people often call stomach ulcers. They occur either in the stomach or, more commonly, in the duodenum, the upper end of the small intestine.)

The bacteria also appear to cause some forms of chronic gastritis and are believed to be the most common cause of stomach cancer. A preventive vaccine could sharply reduce the death toll from this hard-to-treat malignancy – particularly in the developing world where it is much more common, said Monath.

ULCERS, Page 29

For ulcers, the end may be approaching

■ ULCERS

Continued from Page 25

His company, in a joint venture with Pasteur Merieux Serums & Vaccins of France, is safety-testing an oral vaccine in Europe. Other vaccine efforts are in earlier stages.

Given the amount of suffering, doctoring and medication that ulcers cause, the thought of wiping them out with a vaccine taken by mouth is startling.

"Just 2½ years ago it was thought that this was an over-ambitious idea, but the medical community as a whole has become very enthusiastic about pursuing this goal," said Dr. Frank Hamilton, who heads the gastroenterology division of the National Institute of Diabetes and Digestive and Kidney Diseases.

What turned the tide, he said, was a report last year from Swiss scientists showing that a vaccine prevented mice from becoming infected with a bacterium closely related to *H. pylori*, the spiral-shaped bacterium that scientists now say causes the vast majority of ulcers.

Still, the vision remains an ambitious one. An estimated 5 million people in the United States alone

voiced caution about the link: "I think we're now really persuaded that just about all ulcers are caused by *H. pylori*, and we have treatments that can eradicate the bacteria in 90 percent of cases.

H. pylori is transmitted by contact with fecal material, vomit and saliva. Once in the body, the bugs burrow under the mucous lining of the stomach and apparently remain there for life. They are estimated to infect about one-third of people in the United States and far more in developing countries. Researchers believe the percentage of people infected rises with age, so that at age 20, 20 percent have *H. pylori*, at age 30, it's 30 percent, and so forth.

In an interview last week, Monath pointed to a electron microscope photo showing several of the spiral bacteria lodged in one of the millions of deep pits, called crypts, that punctuate the stomach lining.

The bugs' spiral shape "is for moving in a corkscrew fashion through this slime," he said, indicating the mucus layer that protects the stomach – which *H. pylori* has learned to love and call home. He said the bacteria don't invade the

suffer from peptic ulcer disease ("peptic" refers to pepsin, a digestive enzyme). In 1987, the last year for which the National Institutes of Health has figures, peptic ulcers led to 630,000 hospitalizations and 5 million visits to doctors' offices. Ulcers kill relatively few people – about 6,300 deaths annually – but cause enormous disability and lost productivity. In this country, more than $3.2 billion a year is spent on treating peptic ulcer disease.

For more than a century, doctors have veered from one idea to another about the cause of ulcers, which are eroded areas in the lining of the stomach or duodenum. Diet, emotional stress, excess acid production, failure of the chemical barrier that prevents the stomach from digesting itself – all have had their turn as the presumed villains.

In recent years, expensive drugs that block acid secretion in the stomach have been among the top-selling of pharmaceutical products.

In 1982, however, two Australian physicians argued – in the face of intense skepticism – that the real culprit was *H. pylori*, a bacterium that infects millions, beginning in childhood. Over the last several years the idea has come to be widely accepted, notably in a 1994 consensus report by the National Institutes of Health.

Only about one-tenth of those who harbor the bug actually develop ulcers in the stomach or duodenum, and it's not clear why *H. pylori* infection leads to ulcers in some people but not others. Genetic factors probably play a role; diet and environmental differences may be important, too. But these are contributing or modifying factors. Ulcers don't occur unless the bacteria are there.

A small minority of ulcers do have non-infectious origins. Overuse or misuse of non-steroidal anti-inflammatory drugs such as aspirin, ibuprofen, and others often given for arthritis account for less than 10 percent. A still-smaller fraction is traceable to rare diseases in which the stomach pours out extremely high amounts of acid.

Though slow in coming, recognition of *H. pylori* as the prime cause of ulcers has meant that patients who have been plagued with stomach trouble for years can be cured, often for good, with a two-week regimen of antibiotics and bismuth.

"This has changed the whole practice of treating ulcer disease," said Dr. Timothy Wang, a gastroenterologist at Massachusetts General Hospital.

Adds Dr. Peter Banks, head of clinical gastroenterology at the Brigham and Women's Hospital, who as recently as two years ago had cells of the stomach but instead attach themselves to them, "and sit there and pump out toxins" as they break down tissue to get at nutrients. The bugs also stimulate stomach acid production, adding to the assault on the cells lining the stomach and duodenum.

The body's defenses don't sit passively by when *H. pylori* take up residence. The immune system generates antibodies – proteins that seek out and attach to invading microbes. In fact, doctors use a blood test for the antibody as a means of diagnosing the infection. For reasons not understood, however, the immune reaction doesn't get rid of the bacteria.

But the vaccine now being tested by OraVax and its European partner does, at least in animals. The basis of the vaccine is an *H. pylori* gene for urease, an enzyme found on the bacteria's outer membrane that enables the bugs to survive in the highly acid environment of the stomach.

When a portion of the urease protein was given to mice in an experimental vaccine, it stimulated an immune response that protected the animals against *H. pylori* infection. Monath explained that the protein prompted certain cells in the stomach lining to secrete a substance called immunoglobulin G, which attacks the bacteria and causes them to clump together, ultimately to be swept away and excreted.

The purified urease protein is made through recombinant DNA technology and appears to be entirely safe, said OraVax's Monath.

"Our primary goal is a therapeutic vaccine" that will be even more effective than antibiotics and bismuth at ridding patients of ulcers, said Monath. Next, the company would target patients who have healed ulcers, to prevent relapses, a common problem.

Eventually, it would be possible to test the population at large – perhaps in the early school years – and administer a vaccine to those who are infected with *H. pylori*, and perhaps even those who aren't, as a preventive, he said.

Hamilton, the gastroenterology specialist at the NIH, said some are concered about the cost of the vaccine and whether widespread immunization would be practical, particularly in the developing world.

However, he added, "Gastric cancer is the second-most common cancer in the world. If it turns out that *H. pylori* has a true causal relationship to this disease, as it appears, that would be a strong reason why you would take a very aggressive position" on immunizing large population against the bug.

West Nile virus takes strong hold

Work on vaccines for humans, horses is under way

Jane Lerner
and Melissa Klein
The Journal News

WHITE PLAINS — The West Nile virus mysteriously arrived in New York nearly two years ago and, after studying it for just as long, scientists still are puzzled by what its presence here means to people and animals.

International scientists who met at a three-day conference at the Crowne Plaza Hotel this week revealed clues about the mosquito-borne illness, but admit there is much they don't know.

"Nothing about this virus has been classic," said Tracey McNamara, a Bronx Zoo veterinarian who was among the first in 1999 to recognize that a new virus had emerged after birds began to die at the zoo.

Among the findings presented by researchers was evidence that birds may give the virus to other birds, rather than contract the disease through the bite of an infected mosquito.

While the common house mosquito, culex pipiens, has been suspected as the main culprit in transmission of the virus, researchers are now more closely investigating other mosquito species that also appear to play a role.

Even before those questions are answered, there already is preliminary work toward a vaccine by two pharmaceutical companies, one of which has started testing its version for horses. Horses also are susceptible to West Nile, and 28 became ill in New York last year.

West Nile sickened 18 people in New York and New Jersey last year and two of them died. In 1999, 62 people in New York became seriously ill, seven fatally.

As research into West Nile progresses, some scientists said they are limited in the work they can do by a lack of money.

McNamara said more money should be devoted to tracking the disease in animals, which could yield answers about the virus in humans. West Nile has killed thousands of birds and some mammals.

"The answer rests within the animals," she said. "The funding is still all going toward the humans."

There are many animal studies under way, among them research at the National Wildlife Health Center in Wisconsin, which is looking at how crows contract the virus. In laboratory experiments, infected crows passed the virus to other crows, possibly through their feces, said Robert McLean, the health center's director.

Researchers believe the virus will continue to spread this summer, although there is no certainty about how many people, if any, will become sick.

"This virus has taken a very strong hold in a very short time, and I think we would be irresponsible not to develop a vaccine, which is the most efficient way of protecting people against any infectious disease," said Dr. Thomas Monath, vice president of research and medical affairs at Acambis Inc. in Cambridge, Mass.

Monath said the company hopes to begin manufacturing a West Nile vaccine in January for clinical trials in humans. If the vaccine works, it could still take at least four years before it becomes available. Monath said test results on the horse vaccine are expected in a few months.

Pesticide company accused of improper supervision and training of apprentices

Melissa Klein
The Journal News

The company that sprayed pesticides to combat the West Nile virus last summer has been charged with violating state environmental law for not properly training or supervising 31 apprentice workers.

The violation notice given this week to Clarke Environmental Mosquito Management of Roselle, Ill., focuses on the spraying the company did in New York City, but an investigation is continuing into pesticide application in the suburbs, said Jennifer Post, a spokeswoman for the state Department of Environmental Conservation.

"Applicators are required to provide safety training on the proper use of pesticides, on proper techniques such as not spraying into the wind and also the use of safety equipment such as gloves and respirators," Post said. "They did not."

The company had contracts to spray the pesticide Anvil to kill mosquitoes carrying the West Nile virus during the last two years in Westchester and Rock-

Rules relaxed in rush for new smallpox vaccine

Charlotte Denny

The US government is to allow drug firms to speed up safety trials in their search for a new smallpox vaccine as fresh evidence emerges that Washington is preparing itself for full-scale biological warfare.

Tommy Thompson, the US health secretary, asked Congress this week for $500m (£350m) to produce enough smallpox vaccine "so every American will be assured there is a dose with his or her name on it if it is needed".

The administration has stepped up its preparations for more biological attacks after the anthrax campaign which has killed three people. Officials disclosed yesterday that three new suspected cases of inhalation anthrax had been reported by a hospital near Washington.

All were linked to a contaminated letter sent to Senator Tom Daschle in the Senate Hart office block. Last night police announced that a lift in the building had tested positive for anthras — the fifth location in the Capitol complex.

The health secretary wrote to leading companies asking if they could make a smallpox vaccine available by the end of next year. New drugs normally have several years of safety testing.

Industry observers say Washington is prepared to let firms compress clinical trials into 12 months. The government has promised legal protection for companies. No American producer has made smallpox vaccine since the 1980s and most will have to start from scratch. Vaccination for the disease stopped after smallpox was eradicated in the 1970s, but experts fear it might be used as a biological weapon.

A British company, Acambis, which has developed a new vaccine, said it hoped to complete safety trials in 18 months.

The Acambis vice-president, Thomas Monath, told a Senate committee yesterday that no private insurers would cover a company bringing out a vaccine in record time for potential use on a mass of people.

Virus drugs nearly ready

But approved Nile vaccine takes time

BY JUSTIN GILLIS
The Washington Post

At least half a dozen laboratories and companies around the world are reporting headway in developing a vaccine against the West Nile virus, with enough tests completed in animals to suggest that several of the vaccines are likely to work in people. Two labs are expected to launch human tests by late this year.

But despite the rapid progress, an approved vaccine to prevent West Nile fever and its potentially life-threatening complications remains several years away, scientists said, because of the time needed to conduct thorough safety and effectiveness tests in people.

And it remains unclear how large a commercial market a vaccine might command, given that the overwhelming majority of people infected with the virus never get sick.

Big vaccine companies

See **VIRUS**/*A12*

VIRUS

Vaccine research

Continued from Page A1

have so far stayed away from West Nile virus, apparently deterred by the business uncertainties. But a handful of small biotechnology companies, motivated in part by government grants meant to prod industry into action, are chasing the goal of being first to market.

These companies see a potential market among older Americans, who appear to be at greatest risk of developing West Nile fever or its most severe complication, a potentially deadly swelling of the brain called encephalitis. And the companies are also betting that in the long run at least some American parents, weary of slathering their children with greasy insect repellent, will want a vaccine.

Many of the infectious diseases that have emerged in recent years have frustrated vaccinologists, most notably the human immunodeficiency virus, which causes AIDS. Nearly 20 years of effort have produced no licensed vaccine.

But West Nile virus, which was never seen in the Western Hemisphere and barely noticed by American medicine before a 1999 outbreak in New York, is defying the pattern. So far, every laboratory known to be working on a West Nile vaccine appears to be succeeding, a strong hint to scientists that such a vaccine will eventually be licensed.

Growing concern: When the 1999 outbreak began, the National Institute of Allergy and Infectious Diseases, a unit of the National Institutes of Health in Bethesda, Md., began pushing vaccine research and awarding grants. The costly initiative was controversial at the time, since it was unclear whether West Nile would become a lasting problem in North America. But now—after thousands of cases throughout the United States, 284 deaths last year and 21 so far this year—that early jump-start from NIH appears to have shaved years off the time that might have been needed to develop a vaccine.

A 75-year-old man this week became the first York County resident to die from the West Nile virus, and the total number of people contracting the disease in Pennsylvania continues to rise.

So far this year, 10 York County residents have contracted the disease. The most recent is a 37-year-old man, reported by state health officials Friday.

Statewide the total is 120. Overall, three have died in Pennsylvania this year.

How used? Still, it's unclear how widely such a vaccine would be used or whether authorities would recommend universal childhood vaccination. That will depend on how the epidemic unfolds over the next few years, said Anthony Fauci, director of the infectious-disease institute. In most people who get infected, the virus causes no symptoms and the person acquires strong immunity to West Nile. In a few cases, people get a fever. In a tiny minority of cases, the disease turns into a life-threatening brain infection.

That has tended to happen in older people, which is why they might be the logical target for a vaccine, specialists said. But if the epidemic changes — say, the virus starts making children ill — that approach would likely change too.

"Would I see universal vaccination with West Nile at this point?" Fauci said. "Highly unlikely. But we need to go ahead and make the vaccine to plan for the worst."

Vaccine nearly ready: Leading the pack is Acambis PLC, a company with headquarters in Cambridge, England, and U.S. operations in Cambridge, Mass. That company is best known for supplying the U.S. government with millions of fresh doses of smallpox vaccine that might be used to halt a bioterror attack, a set of contracts that propelled Acambis to prominence in the biotech industry — and to early profitability by the standards of a biotech startup.

Acambis has already manufactured large amounts of a test vaccine for West Nile virus and will enter human trials within a few weeks, said Thomas Monath, the company's chief scientific officer. The company's product, developed with a federal grant, is a variant of the live virus used for decades to vaccinate people against yellow fever. It has been tweaked at a molecular level to look like West Nile on the outside, thus fooling the immune system into mounting a response that would be effective against later West Nile infection.

In trials, West Nile virus was injected directly into the brains of monkeys, the most rigorous animal test possible in a disease that causes brain inflammation. Monkeys that had not received the Acambis vaccine died, whereas monkeys that had received it lived, showing no sign of illness.

A similar approach underlies another advanced vaccine, under development in the laboratory of Brian Murphy at NIH. His lab tweaked a virus developed as an experimental vaccine against dengue fever to make it appear like West Nile to the immune system.

Tests have shown it to be effective in monkeys, and the vaccine is expected to enter human tests by late this year. No commercial sponsor has signed on, but the government is talking to several companies.

Living virus: Australian researchers are also pursuing a live-vaccine approach using a mild relative of West Nile virus, but their work is at an earlier stage. As a rule, live vaccines of this sort give the strongest immunity, but they also pose the greatest theoretical safety risk.

Since the vaccines contain living viruses that reproduce in the body, they can sometimes overwhelm a person with weak immunity, causing disease themselves. That is a particular concern in older people, since immunity declines with age, so the Food and Drug Administration likely will demand extensive study of such vaccines to clarify the risk.

Other approaches offer the potential of safer, but probably weaker, vaccines. These might require several shots to produce initial immunity, and might also require booster shots as a person ages.

One of the most advanced products of this type is under development at Hawaii Biotech Inc. of Aiea, Hawaii, a vaccine made with protein fragments from the coat of the West Nile virus. It has shown good protection in animals, and the company hopes to enter human tests in 2004.

Still other vaccine projects are underway, but most experts feel the world probably has room for two West Nile vaccines at most — one for healthy people, perhaps, and a second, safer-but-weaker vaccine for the elderly and people with immune problems.

Unexpected roadblocks are so common in drug development that most people in the field can't say right now which vaccines will make it to the finish line first.

U.S. bioterror plans ripped

West Nile a wakeup call: expert

By BRIAN KATES
DAILY NEWS STAFF WRITER

As scientists battle the fast-spreading West Nile virus, anti-terrorism experts hope that developing a network to track and stop the epidemic will provide an early warning system for defense against biological attack.

But right now, the U.S. "is totally unprepared to deal with new vector-borne epidemics" — like West Nile virus or those spread by more lethal germs in the terrorist inventory, said Duane Gubler, an internationally recognized expert at the Centers for Disease Control and Prevention.

"West Nile was a wakeup call. We would have been just as unprepared for any other new pathogen," said Gubler, who is leaving the CDC after 14 years as chief of its vector-borne infectious disease lab. "That is a real national security concern."

When the epidemic surfaced in Queens in 1999 — its first appearance in the Western Hemisphere — it caught the nation's fragmented and underfunded public health system completely off guard.

The disease has spread unchecked from New York to 44 other states. This year, it has infected 6,292 Americans, killing 133 — six of them in New York. Two fatalities — a 69-year-old Ridgewood, Queens, man and a 93-year-old man from Dyker Heights, Brooklyn — were reported in the city last month.

"We still haven't been able to get a coordinated program off the ground," Gubler said of the battle to stop the virus.

He and other experts interviewed by the Daily News said the war against West Nile and other emerging biothreats has been mired in agency turf wars and hampered by lack of communication among various branches of government.

Typical example: When Health and Human Services Secretary Tommy Thompson proposed transforming the U.S. Public Health Service Commissioned Corps, a little-known 6,000-member branch of the military, into a rapid-response force against bioterrorism, it was publicly opposed by the heads of the CDC and the Food and Drug Administration.

Four years after the U.S. outbreak, the battle against West Nile remains hamstrung by "bureaucratic jurisdictions that respond to various aspects of the diseases, with little coordination and no clear plan for communicating with the public," according to a study this year by the Trust for America's Health, a nonprofit research group.

"This is especially troublesome," the report said, "given that many of the potential agents for biological weapons are zoonotic" — that is, they originate in animals and spread to humans.

West Nile virus, a relative of yellow fever, is spread by mosquitoes that become infected when they feed on infected birds, mostly crows. They then transmit the disease to people when they bite.

Encephalitis enigma

It started with the mysterious discovery of clusters of dead crows around the city. By August 1999, hundreds of dead crows had been found at the Bronx Zoo. Pathologist Tracey McNamara, fearful that some unknown pathogen would attack the zoo's animals, began autopsies of the birds.

She found severely inflamed hearts and the worst brain damage she'd seen in 18 years of performing animal autopsies.

After six people from Whitestone, Queens, were admitted to Flushing Hospital Medical Center with high fever, altered mental state and headaches, the feds announced on Sept. 3 of that year that the cases were St. Louis encephalitis.

But McNamara wasn't buying it.

"On one hand, there were all these dead birds," she told The News. "They died of encephalitis. On the other hand, you had the people in Queens. That was encephalitis, too." The cases had to be related, she reasoned.

Problem was, birds don't get St. Louis encephalitis. It had to be something else.

As birds continued to die at the zoo, two federal laboratories ruled out St. Louis encephalitis.

As the crisis loomed, McNamara said, she made out her will. "I was scared," she told The News. "The dead birds had given us six weeks of warning before the first people started to die, but that warning was ignored."

As the Trust for America's Health put it, "Public and animal health exist as two distinct fields, separated in both organization and culture."

But efforts are being made, belatedly, to close the gap.

McNamara — who left the zoo after the West Nile debacle was made public — pioneered the National Zoological Surveillance Working Group. A network of more than 35 zoos nationwide, it monitors diseases in zoo animals to provide an early warning of viruses that could spread to humans.

The CDC has established the West Nile Interagency Working Group, which combines the resources of the departments of Health and Human Services, Commerce, Interior, Defense, Agriculture and Environmental Protection.

Since the Sept. 11 attacks, money has poured into the public health system.

"State and local governments can't spend it fast enough," said Jerome Hauer, former city emergency management director and now head of the federal Office of Public Health Preparedness.

Last month, the CDC announced it was giving $870 million — $20.9 million of it to New York City alone — to bolster public health preparedness for bioterrorism and outbreaks of infectious diseases like West Nile virus.

"There has been a great deal of progress in rebuilding public health infrastructure," Hauer said. "There is a long way to go."

Skeeter virus hits 10,000 – docs fight on

Since the outbreak of West Nile virus in Queens four years ago, the disease has spread to all but three states in the lower 48, infecting more than 10,200 people and killing 421.

The virus can enter the body in myriad ways.

An infected woman can pass it to her unborn child or to her nursing baby. It can also invade its victims through blood from an infected donor.

Blood screening has flagged at least 617 infected blood donors since testing began last July. But just last week, the Centers for Disease Control and Prevention reported that the test can't detect all donated blood units infected with the virus.

"We catch most of the people, but not all of them," said Dr. Lyle Petersen, chief of the agency's division of vector-borne diseases.

Meanwhile, the disease continues to spread. And there is no cure.

But no sooner had the '99 outbreak been confirmed as West Nile virus than researchers began hunting for a remedy.

"We sent two scientists to the CDC lab [at Fort Collins, Colo.] with the goal of cloning the envelope protein of the virus to use in constructing a genetically engineered vaccine," said Thomas Monath, chief scientist at Acambis, the front-runner in developing a vaccine.

The company applied for a research and development grant, and was awarded about $3 million by the National Institutes of Health.

Now, after successful trials with animals, the scientists have applied to conduct tests with humans.

But even if everything goes perfectly, Monath said, it could be seven years before the vaccine is on the market.

By then, hundreds of thousands of people could fall victim to West Nile.

"The way things are progressing," Monath said, "we expect there will be in the neighborhood of 10,000 to 20,000 cases a year."

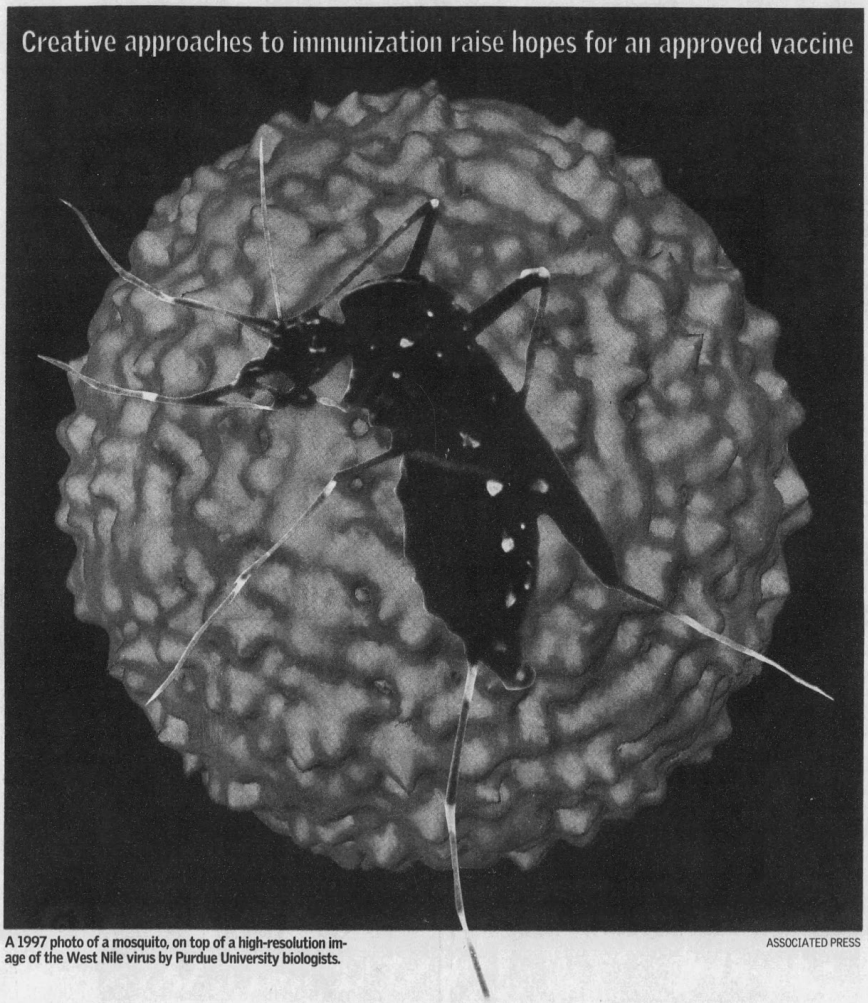
Outsmarting WEST NILE

Creative approaches to immunization raise hopes for an approved vaccine



A 1997 photo of a mosquito, on top of a high-resolution image of the West Nile virus by Purdue University biologists.

ASSOCIATED PRESS

By **BOB GROVES**
STAFF WRITER

Would you rather have an injection of a retooled yellow fever virus that was tested on monkeys, or a shot of dead meningitis germs that were given to geese?

No, this isn't a segment of the reality TV show "Fear Factor." These are two experimental West Nile virus vaccines awaiting human clinical trials. Others are in development.

However bizarre the science behind them may sound, the makers of both vaccines are confident that upcoming studies will prove their products to be safe and effective protection for people against the mosquito-borne illness.

As its fifth season comes to an end, the West Nile virus has infected 8,734 people in the United States, more than double the number recorded last year. This year, 208 died.

Colorado was hit the hardest, with 2,477 cases and 45 deaths. Nebraska ranked second, reporting 1,760 cases and 21 deaths. In New Jersey, 32 had the virus and two died.

"Unfortunately," said Dr. Eddy Bresnitz, the New Jersey state epidemiologist, "West Nile is alive and thriving in New Jersey. It's here to stay."

The West Nile virus is spread by mosquito bites. It can also be transmitted through donor blood, organ transplants, and breast milk.

The virus, which infects humans, birds, and other mammals, mainly causes flu-like symptoms. In a small percentage of cases, it can result in encephalitis and meningitis – inflammation of the brain and spinal cord – or death.

The West Nile virus originated in Africa and caused a number of outbreaks in the Middle East before spreading to New York in 1999. It has infected people in every state except Washington, Oregon, Alaska, Maine, and Hawaii. Though the number of cases doubled this year, deaths dropped by more than 80.

While vaccines to protect horses from the virus have been around for a few years, nothing has been available for humans. Now, two international drug companies lead the field of about a half-dozen firms that are developing West Nile vaccines.

Acambis Inc., a British company based in

Virus: Research on promising vaccines

From Page F-1

Massachusetts, is testing a "chimeric" vaccine, meaning it combines genetic material of two viruses. In this vaccine, protein genes from the West Nile virus are inserted into a live but weakened yellow fever virus and replace similar genes that create immunity.

The vaccine, tested successfully in monkeys, began human clinical trials last month.

Meanwhile, Crucell NV, a Dutch company, is working with a more traditional vaccine made with whole-killed –or inactivated – West Nile virus that is applied to human cells to produce an immune reaction.

Human tests of the Crucell vaccine, which was reportedly successful in protecting thousands of geese against West Nile in Israel, will begin in 2005.

To develop its human vaccine, Acambis chose yellow fever virus because it is closely related to the West Nile virus, said Dr. Thomas P. Monath, a virologist and chief science officer for the drug company.

"It means you're teaching a well-known vaccine [for yellow fever] a new trick" by genetically engineering it to produce immunity against West Nile, Monath said. "We chose the yellow fever vaccine because it's been in use for 65 years, and it's very safe and effective."

The Acambis vaccine is intended for residents of areas where there are ongoing West Nile outbreaks and for any people who are concerned about getting the virus, he said. "I don't know at this point if there will be a public health recommendation for West Nile vaccine," he said.

Crucell used brain cells of newborn mice in developing a West Nile vaccine for geese in Israel, said Dinko Valerio, chief executive officer of the company. The geese, which are bred there for paté fois gras, are very susceptible to the virus, Monath said.

After the vaccine proved effective in protecting more than 90 percent of the geese, Crucell used the same technique to develop a West Nile vaccine for people. But instead of applying the killed West Nile virus to human brain cells, the company used a line of general human cells it created and licensed for biological testing, Valerio said.

Crucell is aiming its vaccine primarily at the elderly, the group that has been most vulnerable to West Nile so far, Valerio said. "That is not to say we wouldn't consider making our vaccine available to younger people who go outside," he said.

It's too early to tell how big a demand there might be for a human West Nile vaccine, Valerio said. "I wouldn't want to be presumptuous. But I can tell you, as a smaller biotech company, whatever the market, it'll be a groundbreaking event for us," he said.

The competing scientists were reticent about discussing each other's proposed vaccine. "There are good things about both," said Monath of Acambis. His company's live, genetically engineered vaccine, he said however, has an advantage of working quickly and requiring only a single dose.

"Acambis took a high-tech approach that is very elegant from a scientific view," said Valerio of Crucell, whose vaccine is made the more traditional way. "But the burden [for Acambis] to prove its safety will be a heavy one [requiring] a tremendous amount of data."

The question for health officials is, who needs the West Nile vaccine? And how big a demand will there have to be to make it worth selling?

"I don't think there will be a large market for it," said Dr. W. Ian Lipkin, an epidemiologist at the Mailman School of Public Health at Columbia University. Lipkin led the team that identified West Nile in encephalitis victims in New York when the virus first arrived in North America.

Because so relatively few people develop symptoms when they are infected with West Nile, much less become fatally ill, there is not much demand for a vaccine or competition to make and market one, he said.

By contrast, the huge demand from horse owners was behind the speed in which a horse vaccine went from lab to marketplace. Horses are a multimillion dollar industry in the United States, and the animals are more vulnerable than humans to the virus. The animals are more vulnerable than humans to the virus. The process was also faster because veterinary vaccines go through a much less rigorous federal testing regimen, health officials say.

Added Bresnitz, "Horses don't wear clothing and they don't use insect repellent," two precautions that people can take against West Nile-spreading mosquito bites.

The challenge for health officials when the human vaccines finish testing will be determining who should be vaccinated, Bresnitz said. A recommendation that a specific group should be vaccinated can drive demand for the vaccine, he said.

New Jersey, like other states, would take guidance from the federal Centers for Disease Control and Prevention on any West Nile immunization recommendations, Bresnitz said.

"It's pure speculation on my part, but I'd bet they're going to target it to people who are more likely to be exposed because of their occupations, people working in an outdoor environment as part of their jobs," he said. This could include utility workers who come in contact with stagnant water and mosquitoes who transmit the virus. Or people who live near swampy marsh areas.

Like the vaccine for tick-borne Lyme disease, a West Nile vaccine probably wouldn't be recommended in general for city dwellers, who have less exposure to mosquitoes than suburbanites, Bresnitz said.

"Like any licensed vaccine, anyone can request it," Bresnitz said. "So it's really an issue of recommendation vs. those who want to have it. It'll be interesting to see what the recommendation will ultimately be."

In New Jersey this year, West Nile showed up in humans, horses, birds, or mosquitoes in all 21 counties. The number of human cases in New Jersey went from none in 1999, when the virus first appeared, to six in 2000, 12 in 2001, and 24 in 2002. This annual doubling rate might continue this year if, besides the 32 human cases confirmed so far, the 18 suspected cases tested and still pending turn out to be positive.

Although West Nile cases are increasing relatively slowly in the state, "the virus is well established throughout New Jersey and continues to circulate every season. We expect to see more of it," Bresnitz said. "It's really hard to predict exactly what's going to happen. It's hard to see any real patterns."

Mosquito control is the best weapon against West Nile, he said.

"We prevented a dramatic increase in cases in humans," he said. "There has been some significant increase in horses, but it probably could have been worse without the use of vaccine. Most of those horses that got West Nile virus were unvaccinated. That supports the efficacy of the horse vaccine.

"Overall, I thought we had a pretty reasonable season, compared to what happened around the rest of the country," he said. "Unfortunately, we can't eliminate West Nile virus as a risk to our citizens. But we can do a lot to minimize the risk."

2005 (May 11) - West Nile vaccine looks good in early human trial

Center for Infectious Disease Research and Policy (CIDRAP)

University of Minnesota

May 11, 2005

Fauci + Monath

https://www.cidrap.umn.edu/news-perspective/2005/05/west-nile-vaccine-looks-good-early-human-trial

2005-05-11-cifrap-umn-edu-west-nile-vaccine-trials.pdf

May 11, 2005 (CIDRAP News) ⬭ An initial human trial of a West Nile virus (WNV) vaccine has yielded promising results, officials said today.

In the double-blind, randomized trial, all but one of the people who received the vaccine developed antibodies to it, according to an Associated Press (AP) report quoting Dr. Thomas Monath, chief scientist at Acambis, the company that created the vaccine.

Results of the trial were to be presented today at the National Foundation for Infectious Disease's (NFID) annual conference in Baltimore, 5 years after the company began researching WNV vaccines. Acambis had received a $3 million grant from the National Institutes of Health. Testing on volunteers began in 2003, the AP reported.

Acambis created the ChimeriVax-West Nile vaccine by combining some genes from WNV with a licensed yellow fever vaccine, the AP story said. The yellow fever virus is a relative of the West Nile virus, and the yellow fever vaccine is known to be safe.

The phase 1 clinical trial involved 80 volunteers. Thirty people received a single high dose of the vaccine, 15 were given a low dose, 30 received a placebo, and 5 received a yellow fever vaccine, Acambis officials said in a news release.

By 28 days after vaccination, 96% of the high-dose group and 100% of the low-dose group had a measurable antibody response, Acambis reported. The company reported mean antibody titers of 1280 and 1350, considered high, in the respective groups.

The rate of vaccination side effects varied relatively little among the high-dose group (40%), the low-dose group (46.7%), and the placebo groups (43.3%), Acambis announced. No serious adverse events were blamed on the vaccine.

"We are encouraged by the immune response generated by trial subjects who were vaccinated with a single inoculation," Monath said in the news release.

The next phase of testing will include a larger sample with more older adults, the AP reported. Provided the second phase goes well, the third phase will involve thousands of people.

Dr. Anthony Fauci, director of the National Institute of Allergy and Infectious Diseases, said he was impressed by the percentage of patients who showed high levels of antibodies, but he cautioned that these are early findings, the AP reported.

Use of the proven yellow fever vaccine to create a safe hybrid could shave years off vaccine development, Fauci added.

No vaccine has been approved for West Nile, which first appeared in the United States in New York in 1999 and has spread to every contiguous state except Washington since then. WNV caused at least 2,470 illnesses and 89 deaths in the United States last year, according to the Centers for Disease Control and Prevention (CDC).

Most people who contract the virus are don't become ill, but about 20% can experience fever, headache, nausea, and vomiting. About 1 in 150 suffers a severe illness, according to the CDC.

Prototype West Nile vaccine effective, tests show

'If we see similar results going forward, we should have a vaccine that will protect against West Nile with a single dose.'

Dr. Thomas Monath
Vaccine developer

BOSTON (AP) — Early tests of a vaccine for West Nile virus are promising, a Cambridge biotech company said Wednesday.

Dr. Thomas Monath, chief scientist at vaccine developer Acambis, said the new vaccine produced enough antibodies to fight off the sometimes deadly disease in all but one of the 60 people who were vaccinated.

It's far too early to know if the vaccine will ultimately work, but a federal health official said these first results were a good sign.

The mosquito-borne West Nile virus has infected more than 16,000 people and killed 684 since its arrival in the United States in 1999. Most West Nile infections are mild and don't cause any symptoms, but the most severe cases can involve paralysis or swelling of the brain and death.

Prevention efforts have focused largely on insecticide spraying, and health officials have been hopeful a vaccine could be developed.

The Acambis test sample was small and was only the first phase, designed to determine the vaccine's safety. A vaccine won't be ready for market for at least three years, but the early results are encouraging, Monath said in an interview Tuesday before results were announced at an infectious diseases conference in Baltimore Wednesday.

"There's a road ahead, but this is a great start," he said.

"If we see similar results going forward, we should have a vaccine that will protect against West Nile with a single dose."

Acambis' research on the vaccine began in 2000 with a $3 million grant from the U.S. National Institutes of Health. Testing on volunteers began in 2003.

Acambis created the vaccine by combining genes spliced from the West Nile virus with a licensed vaccine for yellow fever, a relative of West Nile disease. That allows the West Nile genes to be carried into the body on a vaccine that's proven safe. The virus then causes a weakened infection which the body fights off.

"That results in strong immunization in the same way as if you got naturally infected and recovered," Monath said.

In the second phase of testing, the sample size will increase, including the number of older adults. Testing increases to thousands of people by the third and final phase.

Dr. Anthony Fauci, director of the National Institute of Allergy and Infectious Diseases, said it's too early to get overly excited about the West Nile vaccine, though he said he was impressed by the percentage of patients who showed high level of antibodies.

What was particularly encouraging is Acambis' early success using a proven vaccine to create a safe hybrid vaccine, he said.

"The potential for this is to shave off years in vaccine development," he said.

2015 (Feb 15) - Scientists Scramble To Develop Tools, Treatments For Zika Virus

But with so little known about the basic biology of the mosquito-borne virus, they have a long road ahead

by Bethany Halford

FEBRUARY 12, 2016 | APPEARED IN VOLUME 94, ISSUE 8

Bavari and Monath

https://cen.acs.org/articles/94/i8/Scientists-Scramble-Develop-Tools-Treatments-Zika-Virus.html

2016-02-15-cen-acs-org-scientists-scramble-to-develop-tools-treatments-for-zika.pdf CEN : CHEMICAL AND ENGINEERING NEWS / AMERICAN CHEMICAL SOCIETY

When the Pan American Health Organization put out an alert last May about the first confirmed cases of Zika virus infection in Brazil, the news barely registered. After all, compared with other mosquito-borne viruses, such as potentially life-threatening dengue and yellow fever, Zika seemed pretty harmless. Only 20% of people infected with Zika even become ill, and their symptoms tend to be mild—fever, rash, joint pain, and conjunctivitis.

But in January, nine months after the organization raised the alarm, doctors in Brazil reported a disturbing trend that coincided with Zika's spread across the country. Since October 2015, more than 4,000 babies in Brazil had been born with abnormally small heads and brains—a rare condition known as microcephaly. Although further analysis lowered that figure by 462 cases, the sharp rise nonetheless has experts worried that Zika could be to blame. For comparison, Brazil reported just 147 cases of microcephaly in 2014.

VECTOR CONTROL: RECALCITRANT MOSQUITO BLAMED FOR ZIKA'S SPREAD

With a treatment or vaccine for Zika potentially years away, countries are relying on mosquito control to curb the virus' spread. Aedes aegypti mosquitoes, which inhabit tropical and subtropical regions, have been named as the culprit in transmitting the virus.

But getting rid of Aedes aegypti is extremely difficult because the mosquitoes don't seem to be affected by most spraying regimens, says Joseph M. Conlon, an entomologist and technical adviser to the American Mosquito Control Association. The problem, Conlon tells C&EN, is that Aedes aegypti feed during the day, and pesticides must be sprayed at dawn or dusk to be effective. Also, the mosquitoes like to come indoors to feed. So, unless pesticides are sprayed inside homes, chances are good they're not getting to the insects.

These mosquitoes are very small and you can't feel the bites. "Oftentimes you don't even know you've been bitten," Conlon says.

To get rid of the biting bugs, it's critical to eliminate any standing water. "I've seen Aedes aegypti breeding in discarded soda bottle caps," Conlon says. "They're survivors."

Despite Aedes aegypti's survival skills, the mosquitoes actually have a fairly limited flight range of about 150 m. That has made some scientists suspect that because

Zika has spread so quickly, the more common Culex mosquito may be transmitting the virus as well. The theory is currently being investigated.

"If that is true, that brings this to a whole different level," Conlon says. Culex mosquitoes have a much larger range, he notes, but they can usually be controlled through common mosquito abatement programs.

Zika is also being blamed for an uptick in cases of Guillain-Barré syndrome, a potentially life-threatening disorder in which the body's immune system attacks the central nervous system and causes paralysis. As with microcephaly, the evidence connecting Zika and Guillain-Barré is still circumstantial. Nevertheless, the link is strong enough for the World Health Organization to declare the Zika outbreak a public health emergency of international concern.

Margaret Chan, WHO's director-general, said earlier this month that the virus is "spreading explosively" through the Americas, with cases of active virus transmission in at least 26 countries and territories in the Americas. Panic over the virus has prompted health officials in some countries to take the drastic measure of advising women to delay pregnancy for months or longer. In El Salvador, Deputy Health Minister Eduardo Espinoza asked women to avoid becoming pregnant until 2018.

With Zika making headlines for the past month, scientists have been scrambling to get a handle on the virus. Industry, government, and academic scientists have all announced efforts to develop and test treatments and vaccines. But the path ahead for these researchers is long and full of pitfalls. Even though it's been around for almost 70 years, surprisingly little is known about the virus and its basic biology. A PubMed search for "Zika virus" turns up mostly case studies.

What we do know is that Zika is a flavivirus, a member of the same family as dengue, yellow fever, and West Nile virus. Zika is primarily transmitted via bites from infected mosquitoes, but in recent weeks doctors have reported that the virus can be sexually transmitted as well.

It was first identified in a monkey in Uganda's Zika forest in 1947, but only a handful of human Zika cases were reported until a 2007 outbreak in Micronesia's Yap Island. An outbreak in French Polynesia followed six years later. Last November officials in that country reexamined the cases of microcephaly that followed the outbreak. Before the outbreak, about one case of microcephaly was reported each year. In 2014-15 officials found 17 cases of fetuses and infants with "central nervous system malformations," which includes microcephaly.

As the case connecting Zika to serious health effects builds, the world would love a vaccine or treatment for the virus. But because so few have studied Zika, drug developers currently have few tools to work with. For example, there's no commercially available, U.S. Food & Drug Administration-approved test to screen for Zika virus.

Tracking Zika in people is hard because it's difficult to determine that they're infected with Zika and not a related flavivirus or that they're not infected with more than one virus, says Priscilla L. Yang, a flavivirus expert at Harvard Medical School. Simultaneous infection with Zika and another virus could cause health effects that haven't been seen before.

Scientists can use polymerase-chain-reaction-based methods to distinguish Zika from other flaviviruses. But those tests are accurate only during the short window patients still have the virus in their system—about seven days after infection. By the time a patient has symptoms that warrant a visit to the doctor, the virus is no longer circulating in their bloodstream, Yang notes.

Another option is to look for antibodies against the virus. But Zika and dengue are closely enough related that antibodies to Zika also recognize dengue and vice versa. Making a definitive diagnosis based on antibodies is possible but becomes time consuming and laborious, Yang says.

For scientists who have compounds that might be effective against Zika, actually testing them has been tough. "We have small molecules that seem to be broadly acting against dengue and West Nile virus," Yang says. "We want to test them, but getting access to the live virus has been hard." She's heard that certain labs known to have the Zika virus have been bombarded with hundreds of requests from researchers.

Even if someone manages to access the live virus and can find a compound that kills it in cells, the researcher will hit another roadblock: To date, no one has published practical animal models of Zika virus to screen potential therapies against. Yang points to a paper from the 1970s in which scientists did an intracranial injection of Zika virus in newborn mice, but she notes that is a poor model because many small molecules can't slip past the blood-brain barrier.

"We're basically starting from scratch on this one, unfortunately," says Sina Bavari, chief scientific officer (CSO) at the U.S. Army Medical Research Institute of Infectious Diseases. Bavari and colleagues are currently working with pharma companies to see if they have any compounds that inhibit Zika replication in cells.

They're primarily interested in compounds that have passed the hurdles of Phase I or Phase II clinical trials but are sitting idle for business reasons. That's because it can take upwards of a year and a half just to get a new compound ready for Phase I. "My worry is that by the time we get something out the door, this outbreak will have already burned out," Bavari says.

Scientists are also grappling with this question: If only 80% of people infected with Zika have symptoms, who would get the treatment? The most vulnerable patients are pregnant women, but Bavari points out, there's a high bar when it comes to approving a medication that can be given to them. "They don't even want to drink caffeine," he says.

Other scientists are working to develop a vaccineagainst the Zika virus. Earlier this month President Barack Obama said he would ask Congress for $1.8 billion to combat Zika at home and abroad. Of those funds, $200 million would be used for vaccine development. The U.S. National Institute of Allergy & Infectious Diseases, Sanofi Pasteur, and NewLink Genetics are among the heavy-hitters in the vaccine field who've said they'll step up to the plate.

Even so, it could take three to five years before a vaccine is ready, experts say. Thomas P. Monath, CSO of NewLink's infectious disease division, led that firm's efforts to develop an Ebola vaccine and was CSO at Acambis, where he worked on vaccines for dengue and yellow fever. Monath tells C&EN he thinks a large field trial of 10,000 to 20,000 people across multiple sites will be necessary to determine efficacy once a Zika vaccine is developed. "Only after those trials would you contemplate doing studies in pregnant women," he says.

Monath also says because so many people who are infected with Zika never show any symptoms, it is more difficult to determine whether the vaccine has actually prevented infections. Still, he thinks a large enough trial should be conclusive.

But some scientists say the emphasis on vaccines is misplaced. "We just don't know enough about Zika virus right now to run around and vaccinate people," Bavari says. "Understanding the immunopathology and immunology behind it would be really prudent before starting a full vaccination program."

Harvard's Yang says developing a vaccine for every emerging virus is impractical. "Vaccines are, for the most part, specific. You have one virus and you

Harvard's Yang says developing a vaccine for every emerging virus is impractical. "Vaccines are, for the most part, specific. You have one virus and you have one vaccine for it," she explains. "I don't think we'll ever have the luxury of enough resources to get a vaccine against every single possible emerging virus or enough time to do it in a reactive way."

One area that's not getting as much attention, she says, is development of broadly acting antivirals that could keep a virus in check while the immune system fights it off. Classical antivirals go after a single viral enzyme, but viruses are quick to develop resistance to them. "If people could identify targets that have the potential to be effective against multiple viral pathogens, it could be game-changing," Yang says.

H. Alex Brown, a Vanderbilt University professor who works on antivirals, agrees. "There are so many viruses out there. We need to be working on a much more broad-spectrum approach to infectious disease," he says. "If we can develop more tools to combat broad categories of viruses, I think we would be much better off than we are today."

[note - H. ALex Brown died in 2017 : https://www.asbmb.org/asbmb-today/people/090117/h-alex-brown-1960-2017]

In the meantime, scientists agree that the research community needs to be more organized if it's going to have a real shot at combating Zika. Yang thinks the first steps should be figuring out how to get the necessary reagents to the labs that need them and agreeing on standards so they can compare results and learn from each other's work. "If you actually want to have some sort of impact, we all need to work together," she says. In an encouraging sign, earlier this month, major scientific institutions and top research journals agreed to share data relevant to Zika virus.

Bavari agrees scientists need to be better at organizing their efforts, but he has doubts about the direction the community is taking. "The outbreak is moving so quickly that I am worried people will jump and we won't do the correct research," he says.

2019 (Aug 22) - Crozet BioPharma announces $10.8 million agreement to support development of single dose Nipah virus vaccine through partnership with Public Health Vaccines

https://17d4813b-295a-497f-a849-3e24b1cefa07.filesusr.com/ugd/455626_5ecd4533c07c4d908fe43e1fb28b5a9c.pdf

2019-08-22-455626_5ecd4533c07c4d908fe43e1fb28b5a9c.pdf

thier one and only news release- https://www.crozetbiopharma.com/news-1

Devens, MA, USA; August 22, 2019— Crozet BioPharma, LLC (Crozet) announced today a $10.8 million total value partnering agreement with Public Health Vaccines, LLC (PHV) to advance the development and manufacture of a vaccine against the Nipah virus, listed as a priority pathogen by the World Health Organization.1

The Coalition for Epidemic Preparedness Innovations (CEPI) has granted PHV funding to support pre-clinical development, manufacturing, clinical advancement through Phase 2, and establishment of an investigational stockpile of the vaccine candidate worth up to $43.6 million.2 PHV, a Cambridge-based biotechnology firm, has partnered with Crozet to provide core technical and strategic development services to the program.

Crozet, in collaboration with PHV, will engage its expert team of vaccine developers and manage a coalition of partners to develop the rVSV-Nipah vaccine. This includes design and oversight of critical technical elements of the development program including manufacturing and quality control of the vaccine, nonclinical safety and efficacy studies, tests for measuring immune responses, and Phase 1 and 2 clinical trials.

Dr. Thomas Monath, Managing Partner and Chief Scientific Officer at Crozet Biopharma said: "The Crozet team spent several years developing the successful rVSV-ZEBOV Ebola vaccine. That expertise will greatly facilitate advancement of the rVSV-Nipah vaccine. We look forward to our partnership with PHV, support from CEPI, and the opportunity to work with an extraordinary coalition of experts to develop a rVSV-Nipah vaccine candidate. "

The vaccine candidate was developed by [**Dr. Heinz Ulrich Feldmann (born 1959)**] within the Laboratory of Virology, Division of Intramural Research, National Institute of Allergy and Infectious Diseases (NIAID), part of the National Institutes of Health, and has been licensed to PHV by NIAID. The recombinant vesicular stomatitis virus (rVSV) vaccine candidate expressing a type of Nipah-virus protein (known as glycoprotein G) is designed to induce protection against the virus after a single dose.

Nipah virus, a bat-borne virus, can spread to humans and cause brain inflammation and pneumonia with a high mortality. Epidemics of the disease have emerged during the last 20 years in India, Southeast Asia and the western Pacific.

Dr. D. Gray Heppner, Crozet's Chief Medical Officer said: "Nipah virus infection causes a dreadful disease for which there is no treatment. The Crozet team believes all people at risk of Nipah disease deserve the protection of a safe, effective vaccine."

About Crozet BioPharma

Crozet BioPharma, LLC, headquartered in Devens, Massachusetts, is a biotechnology company developing medical countermeasures for infectious disease and cancer. Crozet's team includes individuals with deep industry experience demonstrated by their collective track record and experience developing ten licensed vaccines. While at NewLink Genetics, the Crozet team enabled transfer of the technology to Merck, obtained over $100 million in funding and supported Merck's advanced development of the rVSV-EBOV Ebola vaccine. Most recently, Crozet has partnered with PHV to support delivery of PHV's rVSV-Marburg and rVSV-Nipah vaccine candidates. For more information, visit the company's website at www.crozetbiopharma.com.

About PHV

Public Health Vaccines, LLC. (PHV), headquartered in Cambridge, Massachusetts, is a privately-held biotechnology company developing vaccines for the prevention and control of emerging infectious diseases. For more information, visit the company's website at www.phvaccines.com.

Abstract. The COVID-19 pandemic is among the deadliest infectious diseases to have emerged in recent history. As with all past pandemics, the specific mechanism of its emergence in humans remains unknown. Nevertheless, a large body of virologic, epidemiologic, veterinary, and ecologic data establishes that the new virus, SARS-CoV-2, evolved directly or indirectly from a β-coronavirus in the sarbecovirus (SARS-like virus) group that naturally infect bats and pangolins in Asia and Southeast Asia. Scientists have warned for decades that such sarbecoviruses are poised to emerge again and again, identified risk factors, and argued for enhanced pandemic prevention and control efforts. Unfortunately, few such preventive actions were taken resulting in the latest coronavirus emergence detected in late 2019 which quickly spread pandemically. The risk of similar coronavirus outbreaks in the future remains high. In addition to controlling the COVID-19 pandemic, we must undertake vigorous scientific, public health, and societal actions, including significantly increased funding for basic and applied research addressing disease emergence, to prevent this tragic history from repeating itself.

In 2007, scientists studying coronaviruses warned: "The presence of a large reservoir of SARS-CoV–like viruses in horseshoe bats... is a time bomb. The possibility of the re-emergence of SARS and other novel viruses... should not be ignored."[1]

Few paid attention following the disappearance of SARS after the initial outbreak in 2002. Now, 18 years later, COVID-19 has emerged as the deadliest respiratory disease pandemic since 1918, when the "Spanish" influenza pandemic killed an estimated 50 million people.[2] We need to understand what happened so that we can prevent it from happening again, and be better prepared to contain similar pandemics at their outsets.

EMERGENCE OF THE COVID-19 PANDEMIC

The agent of COVID-19, SARS-CoV-2, was named after the genetically related SARS-CoV (more recently distinguished by some as SARS-CoV-1), which caused a deadly near-pandemic in 2002–2003.[3] Before 2019, neither SARS-CoV-2 nor its genetic sequences had ever been identified in viruses of humans or animals.

Even so, scientific research conducted over the last two decades provides clues about how and why the COVID-19 pandemic appeared. We must understand these critically important scientific findings, described in the following text, so that we can better address significant existential risks we will continue to face for the foreseeable future.

HOW VIRAL DISEASES EMERGE

Viruses are compact nucleic acid packages of either DNA or (in the case of coronaviruses) RNA associated with proteins, and in some cases with lipids. Viruses are not living organisms and can only reproduce inside living cells susceptible to viral entry and with the capacity to replicate viral nucleic acids and translate nucleic acid signals into amino acids to build viral proteins. Viruses are therefore nonliving self-contained genetic programs capable of redirecting a cell's machinery to produce more of themselves.

It follows that when a virus enters a human cell for the first time, it has very recently been transmitted from cells of some other host, that is, from another animal or, for example, an insect vector. Emergence of a pathogen between a vertebrate or an insect has been referred to as host-switching, sometimes described as a spillover event. Most of the human viral and nonviral infectious diseases that have existed for centuries—measles, influenza, cholera, smallpox (eradicated in 1980), falciparum malaria,[4] dengue, HIV, and many others—originated by animal-to-human host-switching.[5] The complex genetic events that underlie host-switching differ greatly from pathogen to pathogen, but general mechanisms have been recognized for many.[6–9]

Host-switching determinants prominently include social, environmental, and biological factors providing the opportunity for host–species interaction; shared host cell receptors; genetic distance between transmitting and receiving hosts; and characteristics and complexity of the viral quasi-species or viral swarm. (RNA viruses in particular are not transmitted to multiple cells as identical virions, but as collections of thousands of different genetically related virions. The ever-changing complexity of the viral swarm varies among species, genetically distinct but related individuals of the same species, and in single hosts over time.)

[HI002C][GDrive]

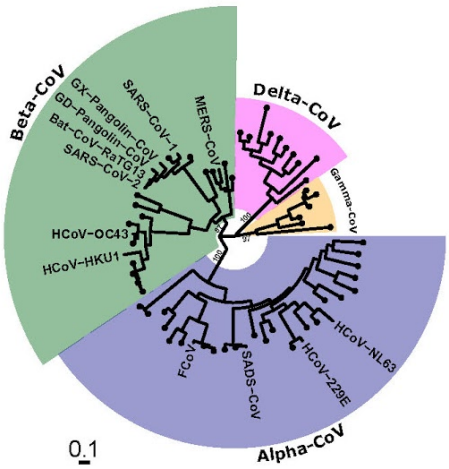

FIGURE 1. Phylogenetic relationships of selected coronaviruses of medical and veterinary importance. Human SARS-CoV and SARS-CoV-2 are closely related to numerous bat and pangolin coronaviruses in a viral genetic grouping called sarbecoviruses, which contains many other viruses very closely related to SARS-CoV and SARS-CoV-2. These viruses belong to the order *Nidovirales*, family *Coronaviridae*, subfamily *Coronavirinae* and the four genera *Alphacoronavirus*, *Betacoronavirus*, *Gammacoronavirus*, and *Deltacoronavirus*. The betacoronaviruses are comprised of two subgenera, *Sarbecovirus* and *Merbecovirus*. The former include SARS-CoV and SARS-CoV-2; the latter includes Middle East respiratory syndrome-related coronavirus (MERS-CoV). Image created by Sebastian M. Gygli, Ph.D., NIAID, NIH, and used with permission.

Studying animal viruses that have previously spilled over into humans provides clues about host-switching determinants. A well-understood example is influenza virus emergence into humans and other mammals.[2] Human pandemic and seasonal influenza viruses arise from enzootic viruses of wild waterfowl and shore birds. From within this natural reservoir, the 1918 pandemic "founder" virus somehow host-switched into humans. We know this from genetic studies comparing avian viruses, the 1918 virus, and its descendants, which have caused three subsequent pandemics, as well as annual seasonal influenza in each of the 102 years since 1918. Similarly, other avian influenza viruses have host-switched into horses, dogs, pigs, seals, and other vertebrates, with as yet unknown pandemic potential.[2,10,11] Although some molecular host-switching events remain unobserved, phylogenetic analyses of influenza viruses allow us to readily characterize evolution and host-switching as it occurs in nature.[2]

CORONAVIRUSES

Coronaviruses are RNA viruses globally distributed in a large but unknown number of animal species. Coronaviruses important for humans are found within phylogenetically distinct taxonomic subgroups, labeled as the α- and β-coronaviruses (Figure 1).[12] Four endemic human coronaviruses, which emerged at some undetermined time in the past, cause (mostly) mild self-limited upper respiratory tract infections (Figure 1).

RECENT CORONAVIRUS EMERGENCES FROM ANIMALS INTO HUMANS

Until recently, relatively little was known about coronaviruses, and research interest in these common cold viruses was minimal. Eighteen years ago, a previously unknown β-coronavirus named SARS-CoV suddenly emerged. Following its initial appearance in China it spread to 29 other countries, causing a near-pandemic and killing 813 of the 8,809 people with confirmed infection before being controlled by aggressive public health measures. It has not been seen since. In 2012, however, another previously unknown β-coronavirus named Middle East respiratory syndrome coronavirus (MERS-CoV), and closely related to SARS-CoV, emerged to cause high case-fatality human infections. Fortunately, this virus does not efficiently transmit between humans, and cases have been largely limited to the Middle East where its intermediary host, the dromedary camel, is present in relatively high numbers. In 2016, yet another novel bat-origin coronavirus, an α-coronavirus, emerged in China to cause a novel epizootic disease in pigs, termed swine acute diarrhea syndrome coronavirus (SADS-CoV). And most recently, at least as early as late November 2019, SARS-CoV-2 was recognized and became the third fatal bat virus–associated human disease

Laura Kahn - Meat, Monkeys, and Mosquitoes: A One Health Perspective on Emerging Diseases

Dec 14, 2017

CSER Cambridge

Agriculture is the foundation of civilization. Food security from agriculture enabled the growth of cities; cities led to nations, and nations discovered the science and technology that allowed our numbers to grow. But agriculture comes with costs including deforestation, environmental destruction, and emerging diseases. Meeting the growing world population's demand for food, especially meat, while ensuring global health and sustainability in an era of climate change is one of the great challenges of the 21st century. One Health is the concept that human, animal, and environmental health are linked. This concept can serve as a framework to analyze the interrelationships between food security, the environment, and emerging diseases. Approximately 75 percent of newly emerging diseases come from animals, called 'zoonoses.' Mosquito-borne zoonoses, such as West Nile virus and Zika virus, exemplify the importance of implementing a One Health approach to interdisciplinary threats. One Health is being embraced worldwide.

[HB006B][GDrive]

I used to believe that the “cancer conspiracy” was an unintentional result of the love of money and that there were really no malicious intentions at its roots. However, due to stories like the three that follow, I believe that I was a bit naïve in my initial assessment of the situation.

In 1931, [**Dr. Cornelius Packard "Dusty" Rhoads (born 1898)**], a pathologist from the Rockefeller Institute for Medical Research, purposely infected human test subjects in Puerto Rico with cancer cells, and thirteen of them died. Despite the fact that Rhoads gave a written testimony stating he believed all Puerto Ricans should be killed, **he later established the U.S. Army Biological Warfare facilities in Maryland, Utah and Panama, and was named to the U.S. Atomic Energy Commission, where he began a series of radiation exposure experiments on American soldiers and civilian hospital patients**.

Then, in **1963, Chester M. Southam** (who injected Ohio State Prison inmates with live cancer cells in 1952) performed the same procedure on twenty-two senile, African-American female patients at the Brooklyn Jewish Chronic Disease Hospital in order to watch their immunological response. He told the patients that they were receiving “some cells,” but conveniently left out the fact that they were cancer cells. Ironically, Southam eventually became president of the American Association for Cancer Research!

In 1981, the **Seattle-based** **Genetic Systems Corporation** began an ongoing medical experiment called “Protocol No. 126” in which cancer patients at the **Fred Hutchinson Cancer Research Center** in Seattle were given bone marrow transplants that contained eight experimental proteins made by Genetic Systems, rather than standard bone marrow transplants. As a result, 19 human “subjects” died from complications directly related to the experimental treatment. [**MORE on the research in Seattle that may possibly connect to Gates : See** **Genetic Systems Corporation**] [...]

Bellevue High School THE COMET, 1924

hardest fought that Bellevue played, being featured by Bellevue's terrific line-plunges and end runs by Kern. But the gods seemed to be not favoring us and we could not make our gains count.

October 20, Bellevue played Norwalk. The game was featured by long and short passes by which Norwalk was able to make two of their touchdowns, kicking goal both times. The game progressed until the third quarter when Nuby made one of his passes of forty-five yards which was caught by Weyls and a touchdown resulted for Bellevue. We failed to kick goal and Norwalk scored in the fourth quarter. The game ended 20-6 in Norwalk's favor.

October 27, Fremont, our next opponent met us on the home field, Bellevue, through their superior line work made their first touchdown with Moore carrying the ball. Bellevue failed to kick goal. Toomey then opened up in the third quarter with a pass to Nuby, who ran twenty yards for a touchdown. The final score was Bellevue 12, Fremont 0.

Bellevue's next opponent was Tiffin who was easily defeated by the decisive score of 42-0. Kern's end-runs and Nuby's and Toomey's passing featured the game.

On November 17, the team played its last game with Sandusky on Sandisky's home field. In the second quarter Sandusky fumbled on a pass and by the quick work of Weyls who caught the ball a touchdown resulted for Bellevue. Bellevue however, failed to kick goal. In the fourth quarter Sandusky obtained a touchdown via the aerial route and kicked goal. The game ended with a score of Sandusky 7, Bellevue 6.

Basketball

Bellevue's Basketball Team with but two letter men, again enjoyed another excellent season. Their record of four victories and seven defeats is mute evidence of what was accomplished with a new team.

Bellevue opened her schedule with Green Springs, followed by Bucyrus and the Alumni. Bellevue was defeated by all three. The scores were as follows: Greenspring 19, Bellevue 10; Bucyrus 31, Bellevue 16; Alumni 23, Bellevue 20. In each game it was seen that the team was progressing and was fast becoming a strong, efficient one and Bellevue fans entertained great hopes for it.

Bellevue opened her League schedule by journeying to Oberlin, January 4. The game was hotly contested but the locals were defeated by the narrow score of 21-22.

On the night of January 11, Bellevue played her first home game in the Coliseum with Elyria. This game was probably the most spectacular of the season. Nuby featured by dropping six field goals through the net. Bellevue won by the score of 28-24.

The following week, Bellevue played at Lorain. Through the efficient work of Fadely while shooting field goals we won with the score of 24-16.

On January 25, Bellevue played Norwalk at home. Norwalk was out for a victory because she held first place in the League. This was probably one of the hardest games Bellevue has ever played. The score at the half was Bellevue 10, Norwalk 11. The boys were unable to overcome the lead and the game ended Norwalk 18, Bellevue 16. In this game Bellevue lost a valuable man in the person of Nuby. Because of the age ruling of the State Association he was forced to quit the team. His loss was keenly felt by all the team. His place was very efficiently taken by Robert Koechley, who along with Keeler and Beckley promise great things for the future.

February 1, Bellevue went to Fremont where, after a hard fought game during which it looked as though we would surely lose, the boys came through and we were the victors with a score of 26-24.

After a brief rest of one week, Bellevue resumed her League schedule at home on February 15, with Sandusky, where the excellent floor work of Weyls and Fadely's

Dear Doctor Sabin,

I would greatly appreciate a reprint of your paper which appeared in the British Journal of Experimental Pathology February 1935 (The mechanism of immunity to filterable viruses) Parts I-II.

Yours very sincerely,

Maurice Landy

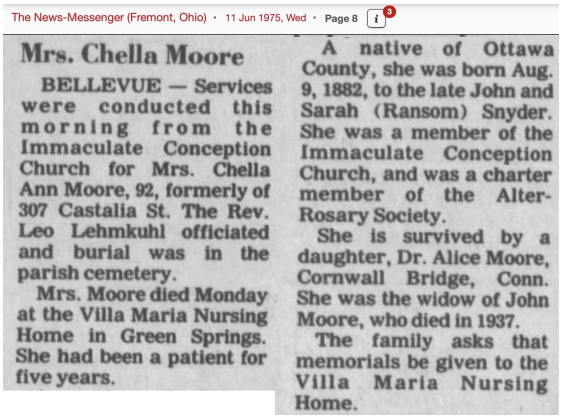
1937 - Father passes / Mother transfers property



The News-Messenger (Fremont, Ohio) · 11 Jun 1975, Wed · Page 8

Mrs. Chella Moore

BELLEVUE — Services were conducted this morning from the Immaculate Conception Church for Mrs. Chella Ann Moore, 92, formerly of 307 Castalia St. The Rev. Leo Lehmkuhl officiated and burial was in the parish cemetery.

Mrs. Moore died Monday at the Villa Maria Nursing Home in Green Springs. She had been a patient for five years.

A native of Ottawa County, she was born Aug. 9, 1882, to the late John and Sarah (Ransom) Snyder. She was a member of the Immaculate Conception Church, and was a charter member of the Alter-Rosary Society.

She is survived by a daughter, Dr. Alice Moore, Cornwall Bridge, Conn. She was the widow of John Moore, who died in 1937.

The family asks that memorials be given to the Villa Maria Nursing Home.

Father John Moore passed in 1937, as noted in this 1975 newspaper clip

HAD GUESTS

Holiday guests of Mrs. Frank H. Berger at her home on Buckland avenue, and for the family dinner on Christmas day, were Ralph Snyder, Mr. and Mrs. Don Snyder and children, Dee Dorine and Donnie of Sandusky; Mr. and Mrs. Will Snyder of Clyde; Mrs. Chella A. Moore of Columbus; Miss Alice Moore of New York City. The latter, a niece of Mrs. Berger, is returning to her home Friday.

1940 (Aug) - Research publication at New York Univ. - With Dr. Thomas Francis Jr. - " A Study of the neurotropic tendency in strains of the virus of Epidemic Influenza"

This is the first published research with Alice E. Moore's name on it / Source of PDF : [HE0043][GDrive]

- **Dr. Thomas Francis Jr. (born 1900)** is the first person to isolate influenza virus in the United States
- Dr. Thomas Francis in 1935-1936 was working closely with **Dr. Richard Edwin Shope (born 1901)** , as shown in this influenza research : [HI0031] [GDrive]
- **Dr. Thomas Francis Jr. (born 1900)** was a later a mentor to **Dr. Jonas Edward Salk (born 1914)** starting at the University of Michigan in 1942

A STUDY OF THE NEUROTROPIC TENDENCY IN STRAINS OF THE VIRUS OF EPIDEMIC INFLUENZA*

By THOMAS FRANCIS, Jr., M.D., and ALICE E. MOORE

(From the Department of Bacteriology, College of Medicine, New York University, New York)

(Received for publication, August 13, 1940)

In our laboratory repeated efforts to adapt the virus of epidemic influenza to the brains of mice had been completely unsuccessful. The virus ordinarily failed after intracerebral inoculation to survive in the brain more than one or two days. Cerrutti (1), however, reported the recovery of virus from the brains of mice infected intranasally. Subsequently, Daddi and Pavà (2), and Cerrutti and di Aichelburg (3) noted that influenza virus survived in the brains of rabbits without producing symptoms. Finally, Stuart-Harris (4) described the development of a variant which produced a fatal neurological infection in the brains of mice after intracerebral inoculation. This variant was derived in the following manner: The W.S. strain maintained by pulmonary infection in mice was transferred to the chorioallantois of the developing chick. After 14 transfers on this tissue, hemorrhagic encephalitis of the embryo was noted and on the 21st transfer mice were inoculated intracerebrally. Serial passages at 2 or 3 day intervals were then made in mice until the 12th passage, after which neurological symptoms and deaths occurred regularly. During this entire period the presence of influenza virus was demonstrated by the occurrence of typical lesions in the lungs of mice receiving the same material intranasally.

These observations indicated that the success of the latter experiments was due to an adaptation of the virus to the nervous tissue of the chick embryo. It was decided, therefore, to attempt a similar adaptation by cultivation of influenza virus in tissue cultures containing embryonic chick brain and either Tyrode's solution or physiological salt solution. Since our earlier unsuccessful attempts had all been made with the PR8 strain while the reported positive results had all been obtained with the W.S. strain, the W.S. strain was used.

* This study was conducted under a grant from the International Health Division of The Rockefeller Foundation.

[HE0044][GDrive]

Materials and Methods

Strains of Virus.—The strains of the virus of epidemic influenza employed in this study had all been maintained in chick embryo tissue cultures for several years. The W.S. strain (5) was chosen for the primary investigation since the positive results mentioned above had been obtained with that strain. The PR8 strain which had yielded consistently negative results in our hands was studied simultaneously.

Subsequently other strains were used: Alaska; Henry, isolated in this country; Talmey, from England (6); Melbourne, from Australia (7); two strains of swine influenza virus, S-15 and S-1976, obtained originally from Dr. R. E. Shope.

Methods of Cultivation.—For ordinary purposes the virus was propagated in the customary medium of minced chick embryo (8), although physiological salt solution was usually substituted for Tyrode's solution (regular medium).

For the preparation of cultures in embryonic chick brain the brain of the embryo was removed, minced, and added to physiological salt solution in the absence of all other tissue (brain culture medium).

In some instances combinations of the two were used (mixed culture medium).

Cultures were incubated for 48 hours when transfers to fresh medium were made.

To determine whether virus was surviving in the different media, portions of the cultures at intervals after the 3rd transfer were inoculated intranasally into mice which were then observed for the development of characteristic pulmonary lesions. Neutralization tests with known immune serum were conducted from time to time for serological identification as well.

Attempts to Cultivate Strains of Epidemic Influenza Virus in Brain Culture Medium

In cultures containing only embryonic chick brain the W.S. strain was maintained with ease for as long as 20 transfers while the PR8 strain, in all of five attempts, had disappeared by the 3rd transfer. In two attempts each with Henry, Talmey, and Swine-1976 strains, and three attempts each with Alaska and Swine-15 strains, the virus failed to survive 3 transfers. It appeared at first, therefore, that the capacity to propagate in a medium of chick embryo brain was a characteristic essentially limited to the W.S. strain. The Melbourne strain, however, appeared to occupy an intermediate position between these extremes. In eight of twelve experiments, the virus survived from 3 to 6 transfers in brain or mixed culture medium but as will subsequently be seen differed from the W.S. in its adaptability to mice.

The results of these experiments, summarized in Table I, indicate the sharp differences in ability of different strains to propagate in cultures of brain of the embryonic chick.

DAUGHTER PASSES NATIONAL BOARD

Mrs. John Moore and her sister, Mrs. Frank Berger, received word from New York Thursday that the former's daughter had successfully passed the national medical board and had received her medical degree from New York university. Dr. Moore will arrive here for a visit on June 2, before joining her husband, Maurice Hendershott, in the Adirondacks for a vacation, after which she will return to New York and enter Bellevue hospital for her interneship in straight medicine.

1942 (late) or 1943(early) : Alice Moore is invited to OPERATE the Yellow Fever Vaccine Laboratory at Rockefeller Foundation

See PDF for full Sigma Kappa Triangle Volume 38, No2, issue at [HE004B][GDrive] :

- ***Interning at Bellevue was next -- with a stretch as "senior" on the men's psychopathic ward -- and it probably would have continued at least another year but the increasing medical needs of the war have meant that people who yearn to still learn have to go to active medical work.*** *[This suggests Dr. Alice Moore was there for less than a year]*
- ***And being invited to operate the Yellow Fever Vaccine Laboratory at Rockefeller Foundation, and the first medical female on the Rockefeller Foundation staff, was not anything to turn down.***

See https://en.wikipedia.org/wiki/Yellow_fever_vaccine

- *"In 1937, Max Theiler, working with Hugh Smith and Eugen Haagen at the Rockefeller Foundation to improve the vaccine from the "Asibi" strain, discovered that a favorable chance mutation in the attenuated virus had produced a highly effective strain that was named 17D. Following the work of Ernest Goodpasture, Theiler used chicken eggs to culture the virus After field trials in Brazil, over one million people were vaccinated by 1939, without severe complications.[7] This vaccine was widely used by the U.S. Army during World War II.[21] For his work on the yellow fever vaccine, Theiler received the 1951 Nobel Prize in Physiology or Medicine.[22]Only the 17D vaccine remains in use today.[4]*
- *Theiler's vaccine was responsible for the largest outbreak of Hepatitis B in history: infecting 330,000 soldiers and giving 50,000 jaundice between 1941 and 1942.[23] At the time, chronic infectious hepatitis was not known, so when human serum was used in vaccine preparation, serum drawn from a chronic Hepatitis B Virus (HBV) carrier would contaminate the Yellow Fever Vaccine. Since 1971, screening technology for HBV has been available and is routinely used in situations where HBV contamination is possible including vaccine preparation."*

THE ROCKEFELLER FOUNDATION VIRUS PROGRAM: 1951-1971 WITH UPDATE TO 1981

Wilbur G. Downs, MD. : Department of Epidemiology and Public Health, School of Medicine, Yale Arbovirus Research Unit, Yale University, New Haven, Connecticut 06510

https://www.annualreviews.org/doi/pdf/10.1146/annurev.me.33.020182.000245

[...] When the RF closed out its yellow fever program in the late 1930s there were many experienced field and laboratory workers separated from their lifetime work. Every effort was made to accommodate these workers. Kenneth C. Smithbum, Richard M. Taylor, and J. Austin Kerr were absorbed into the RF Virus Laboratories (RFVL) housed in the North Building of the Rockefeller Institute (now Rockefeller University) complex at 66th Street and York Avenue, New York City. **Bauer was then the head of the Laboratories.** The laboratory did not involute. Theiler discovered the mouse encephalomyelitis virus, and his classic studies of the epidemiology of this infection, with fecal shedding of virus, provided valuable guidelines for later human poliomyelitis virus studies. George K. Hirst. William F. Friedewald, and **Frank L. Horsfall, Jr.** made significant contributions to knowledge of the influenza viruses, and Taylor described influenza C, a type as uncommonly encountered now as it was then.

The threat of World War II introduced new priorities for the RF Virus Laboratories. Studies were started on typhus fevers, with John C. Snyder and Charles R. Anderson participating. Anderson contracted typhus and recovered. Anticipated demands for heavy production of the 17D vaccine for military personnel plunged the laboratory staff into developing the necessary equipment and techniques for the job. **Staff members assigned to this task included, beside Bauer, Delphine H. Clarke and an assigned specialist, Alice Moore. Edward G. Pickels with a well-equipped machine shop and skilled machinists available developed and refined ultracentrifuges, filters, vacuum desiccating apparatus, and electrophoretic apparatus.** Much of this equipment served as prototypes for the laboratory-equipment manufacturing companies that proliferated in later decades. **Early production runs of the vaccine had diluted human serum added as a virus protective buffer. A serious outbreak of serum-transmitted hepatitis occurred in US Army personnel immunized with certain of the early vaccine lots.** Further lots of vaccine had an aqueous base, no serum, and this complication was thus circumvented.

Dr. Moore and Mrs. Hendershott

By FRANCES KIRKPATRICK, *Chi*

THE mailbox is marked "Dr. A. E. Moore and Mr. M. C. Hendershott" in order to provide the necessary information and yet conform to conventions, and the maid and the janitor know that it means "Mr. and Mrs. Hendershott." That's in an apartment building in the Gramercy Park Section of New York City. Then uptown across from Central Park on the East River at the great pile that is the Rockefeller Foundation, it's "Dr. Alice Moore."

It was a long stretch from undergraduate work in bacteriology at Ohio State to being the first woman M.D. on the Rockefeller Foundation staff, and there were a few detours along the way. Al arrived at Ohio State for her junior year from Notre Dame College for Women in Cleveland with her mind all made up that she wanted to find out what was under your skin.

Two more years and she had a B.A. in bacteriology (but she didn't become a Sigma Xi because she had never heard of it so didn't answer the note). When she was a senior she began to work as a technician in veterinary medicine—and acquired the wire-haired Irish terrier who accompanied her to classes from then on, interrupted football games by unscheduled appearances on the field, stole butter regularly for the Sigma Kappa house, acted as host in "Daisy"—Al's famous Model T Ford, and by his name of "Junior" attracted some attention for the idea of not calling children by that name.

Al found out quite a bit about infections and germs by working on animals—but not quite enough. When she was awarded a Fellowship in Bacteriology she moved over to that department and got her M.A. Then came the chance to go to New York and work as a technician in the International Health Division at Rockefeller under Dr. Thomas Francis who has done the primary work on epidemic influenza.

Al, of course, was going to school all the time—and she narrowly escaped getting a Ph.D. in bacteriology. But just when about the only thing that stood in her way was turning in her dissertation, she decided definitely that that wasn't the kind of doctor's degree that she wanted—so she started all over again.

Dr. Alice Moore Hendershott, Chi

There were a few annoyances to get over with—all the bacteriology plus the subjects she'd picked on her own in the suit-yourself College of Arts days didn't quite satisfy for New York University Medical College—but those were made up on the side. So Al started in as a freshman medical student.

When Dr. Francis joined the staff of New York University and transferred his carefully nurtured influenza viruses there, Al went to work there. Flasks held these valuable remnants of infectious particles. They had to be nourished to be kept alive so that scores of mice, monkeys, and ferrets could be infected every week in order to find out the nature of the virus and therefore prevent the disease.

And feeding those viruses meant that Al in gleaming white (and admitted visitors were done up in long white coats too when they were permitted to enter the sterile cubicle) extracted an embryonic chick from a carefully cleansed egg, removed the eye (because the pigment ruined observation of

Al, of course, was going to school all the time -- and she narrowly escaped getting a Ph.D. in bacteriology. But just when about the only thing that stood in her way was turning in her dissertation, she decided definitely that that wasn't the kind of doctor's degree that she wanted -- so she started all over again.

There were a few annoyances to get over with -- all the bacteriology plus the subjects she'd picked on her own in the suit-yourself College of Arts days didn't quite satisfy for New York University Medical College -- but those were made up on the side. So Al started in as a freshman medical student.

When Dr. Francis joined the staff of New York University and transferred his carefully nurtured influenza viruses there, Al went to work there. Flasks held these valuable remnants of infectious particles. **They had to be nourished to be kept alive so that scores of mice, monkeys, and ferrets could be infected every week in order to find out the nature of the virus and therefore prevent the disease.**

And feeding those viruses meant that Al in gleaming white (and admitted visitors were done up in long white coats too when they were permitted to enter the sterile cubicle) extracted an embryonic chick from a carefully cleansed egg, removed the eye (because the pigment ruined observation of reaction) , and then minced the remainder with what looked like manicure scissors, sucked up some of the revolting mess in a pipette, and then carefully let a few drops fall in each test tube. And all of this on the dot, by the clock.

June 1942, brought the M.D. degree with Alpha Omega Alpha honorary medical and passing the National Board of Medical Examiners (good for practice in practically any of the 48 states and just about as much stiffer as that indicates) to indicate caliber of work.

Interning at Bellevue was next -- with a stretch as "senior" on the men's psychopathic ward -- and it probably would have continued at least another year but the increasing medical needs of the war have meant that people who yearn to still learn have to go to active medical work.

And being invited to operate the Yellow Fever Vaccine Laboratory at Rockefeller Foundation, and the first medical female on the Rockefeller Foundation staff, was not anything to turn down.

All of this has left out Mr. Hendershott. "Musty," known to Ohio Staters as one of the most popular Phi Gams, business manager of the Makio, and much such, who had put up with a lot in Al' s medical school and interne days. It looked as if for the first time he was going to get a break and see his wife occasionally, and go to bed without expecting a phone to break into his first slumbers.

And it did work out that way -- about two months. Now the shoe's on the other foot, and Al spends a good part of her weekends trying to catch up with her elusive husband who is moving around the country training navy flyers to spot moving targets -- that's about all that can be said about Musty, because he's too busy for permissible small talk about what he's doing.

Of course, the Vaccine lab is rather busy -- it's making vaccines for the Navy, for instance -- but Al says it's all set up on a production line and goes along smoothly. Night Medical Clinic as a faculty member of N.Y.U. takes up some time. But there was still some empty space-and Al isn't used to having time on her hands. And you can't play tennis in winter or ski in New York and you can't always get theater tickets and couldn't go all the time anyway, so Al's favorite amusements don't fill the gap.

1945 (Aug 08) - Funding announced for Sloan Kettering Cancer Research Institute

In 1945, the chairman of General Motors, Alfred P. Sloan, donated $4,000,000 to create the Sloan-Kettering Institute for Cancer Research through his Sloan Foundation, and Charles F. Kettering, GM's vice president and director of research, personally agreed to oversee the organization of a cancer research program based on industrial techniques.[21] The originally independent research institute was built adjacent to Memorial Hospital.[21]

"Charlotte Friend: A Pioneer in Cancer Cell Biology"

March 10, 2014 by Guest Contributor 1 Comment

The story of **Charlotte Friend** is a true New York story. Friend was a noted microbiologist who made important contributions to the study of cancer. She was an advocate for women's rights and worked hard to improve the position of women in science.

Charlotte Friend was born March 11, 1921 in New York City, a city she loved. She received a Bachelor's degree from Hunter College in 1944 and then entered the Navy, where she was assigned to help direct a hematology laboratory in California. She left the Navy in 1946 and began graduate work in microbiology at Yale University. **By the time she received her doctorate in 1950, Dr. Friend already had a position in the laboratory of Dr. Alice Moore at the Sloan-Kettering Institute in New York City.** She stayed in New York for the rest of her life.

In 1956, Friend gave a paper at the annual meeting of the American Association for Cancer Research in which she stated that she had discovered a virus that caused a leukemia-like disorder in newborn mice. **She was roundly criticized for bringing up what was considered to be the old canard of viruses causing cancer.** Only Peyton Rous, who had made a similar announcement years before, spoke in her defense.

But the tide of change on this issue was turning in the face of mounting evidence. Dr. Friend had not been the only researcher whose work suggested this. By the next year, Friend had published her work in the prestigious Journal of Experimental Medicine, with the careful editing of Dr. Rous. She was also supported by Jacob Furth, who announced that he had studied Dr. Friend's pathologic material and that leukemia truly had been found to result from the new virus, which became known as the Friend leukemia virus.

Friend spent the following years investigating different aspects of the virus, as did many other researchers. She worked with various collaborators, often cooperating in international research efforts. Dr. Friend loved to travel and formed many long-term friendships with colleagues in Europe. Her sabbatical years (1963 and 1975) were spent in laboratories in Australia, Israel, France and Italy. She also attended many international meetings, often being one of only a handful of women scientists there. Still, while clearly social, she also maintained a very small laboratory staff and did not take on many graduate students to work with her.

Dr. Friend was very active in scientific associations and in outside professional activities such as grant reviewing and serving on editorial boards and advisory councils. In the 1970s, when many associations 'discovered' their female members in reaction to the women's movement, Dr. Friend was asked to assume leadership roles in several important organizations including: chairman of the Gordon Conference (1973); member of the Board of Directors (1973-76) and president (1976) of the American Association for Cancer Research; president of the Harvey Society (1978/79); and president of the New York Academy of Sciences (1978).

In 1966, Charlotte Friend left Sloan-Kettering to become the first Director of the Center for Experimental Cell Biology and a Professor at the still developing Mount Sinai School of Medicine. She was the first and only female full Professor in the School when the faculty was officially formed in 1966. She also served as a Professor in the Mount Sinai Graduate School of Biological Sciences. At Mount Sinai, she established her own laboratory, which in 1967 was endowed as the Mollie B. Roth Laboratory. Peyton Rous was the speaker at the event. Still, it was an unending struggle to find the funding to keep the lab well-staffed and well equipped, a situation that got steadily harder as federal funding began to shrink in the 1970s.

Virus Destroys Mice Cancer, New York Scientist Reports

DETROIT, April 17—(UP)—At least three types of mice cancer can be destroyed by a virus known as Russian Far Eastern encephalitis, the fortieth annual meeting of the American Association for Cancer Research was told today.

The report came from Dr. Alice Moore, of the Memorial Hospital Center for Cancer and Allied Diseases, New York City.

She reported that the virus has a strong affinity for cancerous tissue and destroys the cancer in time. However, the virus also attacks the normal tissue of the mice.

It has not been used in human cases and will not be used until more laboratory tests have been conducted. Dr. Moore gave no indication as to when these tests might be concluded.

Cause Is Isolated

A group of Columbia University scientists reported also that the virus which causes breast cancer in mice has been isolated and identified under the electron microscope.

Their work, considered one of the most important steps in recent years in the battle against cancer, said the isolated virus causes mice breast cancer, which closely resembles human breast cancer.

Dr. Moore said the discoveries were of "only theoretical value at the present stage."

"The virus is too strong for practical use," she said. "But an important finding was that cancerous tissue was destroyed before the healthy tissue was destroyed."

She said the next step would be an attempt to change the virus or to find another type which was less violent.

"If we can change the virus to protect healthy tissue, we might be able to cure mice with it. This has been done with virus used to cure other diseases," she said, "and it is possible the same changes can be made in the encephalitis virus to accomplish the same thing."

Technician takes cancerous mice in laboratory . . . Extracts milk . . . in which is found . . . Cancer virus (magnified 25,000 times).

CANCER VIRUS ISOLATED—Columbia university scientists believe they are on threshold of new discoveries in fight against dread cancer of the breast, which attacks about one in 25 women. Biochemists of the university's new Institute of Cancer Research have isolated cancer virus in milk of mice and magnified it by electronic microscope. From there they hope to find way to reduce the disease.

★ ★ ★

Key Viruses Found

One Kills Cancer, Other Produces It

NEW YORK—(UP)—Important gains in the battle against cancer were marked up today by medical science.

One victory on the front where scientists tediously work in the laboratory was the week-end report that a virus has been found that will destroy cancerous growth in mice.

A virus is a submicroscopic agent, a parasite that cannot live by itself—but must get its nourishment from tissue around it. One particular type of virus—that which causes a form of encephalitis, a paralyzing disease—has been "turned loose" on cancers in mice at Memorial Hospital Center for Cancer and Allied Diseases.

Dr. Alice Moore, reporting at the American Association for Cancer Research, said that at least three types of mouse cancer can be killed by the virus. It is the first time that a virus has been known to have such powers.

The virus, she disclosed, has an affinity for cancerous growth. In laboratory tests, it was found, however, that the virus also attacks normal tissue after the cancer has been destroyed, but Memorial doctors are hopeful that the activity of the virus can be checked after the "good work" is done.

Another victory in the cancer fight came from Columbia university where scientists have isolated another virus—but this one apparently doesn't stop cancer. It causes cancer.

The virus, appearing as a white sphere under the powerful electron microscope, has long been suspected as female mice pass breast cancer susceptibility along to their female offspring. The Columbia scientists reported that their new work confirms the theory that a virus causes breast cancer in mice.

The isolation and identification, Columbia pointed out, will give scientists means to study better the chemical makeup of the virus and its behavior. It may also mean that a vaccine against cancer in mice may be developed.

Over the week end there were also reports of new chemicals retarding the growth of cancer in mice. One such new chemical was identified at a meeting in Detroit as Guanazolo, which was reported by Dr. George W. Kidder, Amherst college biologist. The chemical is the newest one to be reported as effective against cancer in mice.

Wallace Beery Rites Scheduled Tuesday

BEVERLY HILLS, Calif.—(AP)—Wallace Beery, Hollywood's "lovable old rascal," will be buried in Forest Lawn Memorial park in nearby Glendale tomorrow.

Many of the film industry's great are expected to attend the funeral in the church of the Recessional at 10:30 a. m. in the Memorial park.

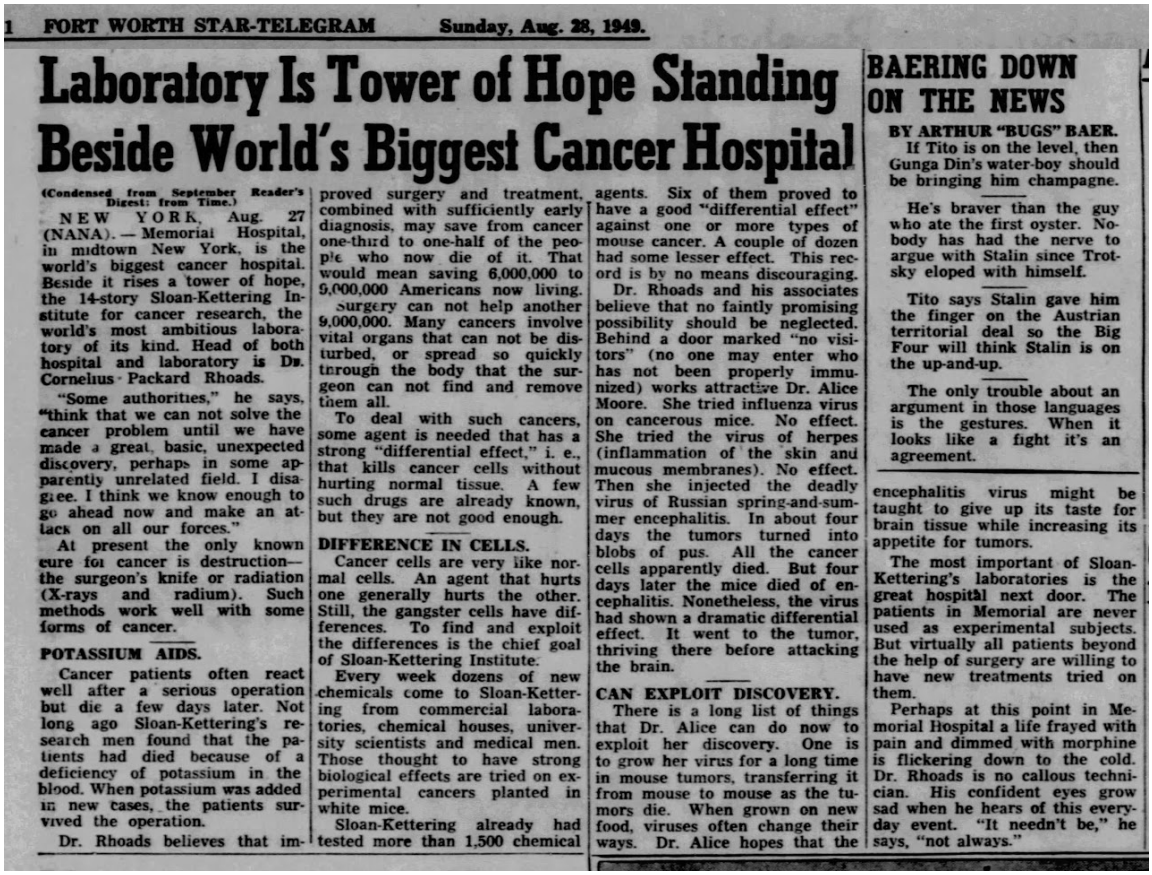
1949-08-28-fort-worth-star-telegram-pg-14-clip-cancer-center.jpg

NOTE - her boss RHoads had worked directly for Smon FLexner **In 1929 Rhoads joined the staff of the Rockefeller Institute for Medical Research, now Rockefeller University, where he worked for Simon Flexner. He was also staff pathologist at Rockefeller Hospital.[11] His early research interests included hematology and poliomyelitis. He worked at Rockefeller until 1939.[12][13]**



1 FORT WORTH STAR-TELEGRAM Sunday, Aug. 28, 1949.

Laboratory Is Tower of Hope Standing Beside World's Biggest Cancer Hospital

(Condensed from September Reader's Digest: from Time.)

NEW YORK, Aug. 27 (NANA). — Memorial Hospital, in midtown New York, is the world's biggest cancer hospital. Beside it rises a tower of hope, the 14-story Sloan-Kettering Institute for cancer research, the world's most ambitious laboratory of its kind. Head of both hospital and laboratory is Dr. Cornelius Packard Rhoads.

"Some authorities," he says, "think that we can not solve the cancer problem until we have made a great, basic, unexpected discovery, perhaps in some apparently unrelated field. I disagree. I think we know enough to go ahead now and make an attack on all our forces."

At present the only known cure for cancer is destruction—the surgeon's knife or radiation (X-rays and radium). Such methods work well with some forms of cancer.

POTASSIUM AIDS.

Cancer patients often react well after a serious operation but die a few days later. Not long ago Sloan-Kettering's research men found that the patients had died because of a deficiency of potassium in the blood. When potassium was added in new cases, the patients survived the operation.

Dr. Rhoads believes that improved surgery and treatment, combined with sufficiently early diagnosis, may save from cancer one-third to one-half of the people who now die of it. That would mean saving 6,000,000 to 9,000,000 Americans now living.

Surgery can not help another 9,000,000. Many cancers involve vital organs that can not be disturbed, or spread so quickly through the body that the surgeon can not find and remove them all.

To deal with such cancers, some agent is needed that has a strong "differential effect," i. e., that kills cancer cells without hurting normal tissue. A few such drugs are already known, but they are not good enough.

DIFFERENCE IN CELLS.

Cancer cells are very like normal cells. An agent that hurts one generally hurts the other. Still, the gangster cells have differences. To find and exploit the differences is the chief goal of Sloan-Kettering Institute.

Every week dozens of new chemicals come to Sloan-Kettering from commercial laboratories, chemical houses, university scientists and medical men. Those thought to have strong biological effects are tried on experimental cancers planted in white mice.

Sloan-Kettering already had tested more than 1,500 chemical agents. Six of them proved to have a good "differential effect" against one or more types of mouse cancer. A couple of dozen had some lesser effect. This record is by no means discouraging.

Dr. Rhoads and his associates believe that no faintly promising possibility should be neglected. Behind a door marked "no visitors" (no one may enter who has not been properly immunized) works attractive Dr. Alice Moore. She tried influenza virus on cancerous mice. No effect. She tried the virus of herpes (inflammation of the skin and mucous membranes). No effect. Then she injected the deadly virus of Russian spring-and-summer encephalitis. In about four days the tumors turned into blobs of pus. All the cancer cells apparently died. But four days later the mice died of encephalitis. Nonetheless, the virus had shown a dramatic differential effect. It went to the tumor, thriving there before attacking the brain.

CAN EXPLOIT DISCOVERY.

There is a long list of things that Dr. Alice can do now to exploit her discovery. One is to grow her virus for a long time in mouse tumors, transferring it from mouse to mouse as the tumors die. When grown on new food, viruses often change their ways. Dr. Alice hopes that the encephalitis virus might be taught to give up its taste for brain tissue while increasing its appetite for tumors.

The most important of Sloan-Kettering's laboratories is the great hospital next door. The patients in Memorial are never used as experimental subjects. But virtually all patients beyond the help of surgery are willing to have new treatments tried on them.

Perhaps at this point in Memorial Hospital a life frayed with pain and dimmed with morphine is flickering down to the cold. Dr. Rhoads is no callous technician. His confident eyes grow sad when he hears of this everyday event. "It needn't be," he says, "not always."

BAERING DOWN ON THE NEWS

BY ARTHUR "BUGS" BAER.

If Tito is on the level, then Gunga Din's water-boy should be bringing him champagne.

He's braver than the guy who ate the first oyster. Nobody has had the nerve to argue with Stalin since Trotsky eloped with himself.

Tito says Stalin gave him the finger on the Austrian territorial deal so the Big Four will think Stalin is on the up-and-up.

The only trouble about an argument in those languages is the gestures. When it looks like a fight it's an agreement.

1949 - Research at Sloan Kettering Institute for Cancer Research - "Inhibition of Development of Sarcoma 180 by 4-Amino-N^{10}-Methyl Pteroylglutamic Acid".

By : [Dr. Alice E. Moore (born 1908)], CC Stock, K Sugiura, [Cornelius Packard "Dusty" Rhoads (born 1898)]

Summary: The compound 4-Amino-N10-methyl pteroylglutamic acid, has shown the ability to inhibit the growth of the transplantable mouse Sarcoma 180 when administered intraperitoneally in concentrations of 1.5 mg/kg each day for 7 days. At this dosage very few ...

PDF : [HI002T][GDrive]

from the blood into the spinal fluid in very small amounts.

Summary. After intravenous injection sucrose occurs in the spinal fluid in very low concentration. Even when hemorrhages into the central nervous system occur, the concentration does not approach that found in blood.

16939

Inhibition of Development of Sarcoma 180 by 4-Amino-N[10]-Methyl Pteroylglutamic Acid.*

Alice E. Moore, C. Chester Stock, K. Sugiura, and C. P. Rhoads.
From the Division of Experimental Chemotherapy, Sloan-Kettering Institute for Cancer Research, New York City.

In view of the extensive developments among the anti-metabolites it was a natural consequence that cancer chemotherapy studies should be initiated with analogs of folic acid. Interest in the folic acid antagonists has been stimulated by reports of the effectiveness of Aminopterin in the treatment of leukemia (Farber).[1] In an intensive screening program during the past year a large number of analogs of folic acid and various related simple compounds have been studied against mouse leukemia[2] and various mouse and rat tumors with particular emphasis on the Crocker mouse Sarcoma 180. Thus far, one folic acid antagonist,[3] 4-Amino-N[10]-methyl pteroylglutamic acid (A-Methopterin),† has been outstanding in its ability to inhibit the growth of Sarcoma 180. The preliminary results of the study are presented.

Materials and methods. The material was tested for ability to inhibit the growth of the Sarcoma 180 and also for its ability to damage a well established tumor.

Carefully selected tumors were cut into 2 mm cubes and implanted subcutaneously into the axillary region of groups of 5 weighed and marked white mice. In the inhibition tests, intraperitoneal injections of 0.5 cc of different doses of A-Methopterin were begun 24 hours later. In the therapeutic test, injections were begun after 3 to 7 days of tumor growth. In all instances, injections were given twice daily at 6-hour intervals for 7 consecutive days. If the animals showed definite signs of a toxic effect of the drug, administration was omitted until recovery had taken place. At the higher dosage (2.5-2.0 mg/kg/day) 3 or 4 omissions were often necessary. Below this level the drug was well tolerated.

Following the period of injections the animals were weighed and the size of their tumors determined by measurement in 2 diameters with calipers. The size of the tumors was then compared with those of the untreated controls and tumor growth was graded according to the following scheme: 1) Inconclusive, in groups of animals where 3 or more died, 2) No effect, when the largest diameter was ¾ or more of the diameter of the control tumors, 3) Moderate effect, when the diameter was ¼ to ¾ of the diameter of the control tumors, 4) Marked inhibition when the diameter was ¼ or less of that of the control tumors; actually, the volume of such a tumor would be 1/64 or less of the control if tumors may be considered spherical.

The animals were again weighed and their tumors measured at the end of the second week.

Results. Groups of 5 mice implanted with the Sarcoma 180 one day previously were injected intraperitoneally with daily doses of A-Methopterin at the following levels: 2.5 mg, 2.0 mg, 1.5 mg, and 1 mg/kg. Deaths due to the toxicity of the material were recorded during the 7-day period of injection. Tumor measurements were made at the end of the period and the effect of the substance on the tumor was evaluated. These data are summarized in Table I.

It is clear that A-Methopterin has a definite inhibitory effect on the growth of Sarcoma 180 at all the levels of drug above 1 mg/kg/day. The drug killed 46% and 18%, respectively, in the groups of mice receiving 2.5 and 2.0 mg/kg/day. At the lower dosages 7% and 5% of the mice receiving 1.5 and 1.0 mg died during the treatment. Male mice appeared to tolerate the drug better than female mice. The best results were obtained at the 1.5 mg dose where a definite effect was noted in almost all instances with little evidence of toxicity. The average weight loss of this group was 1.0 g as contrasted to a gain of 0.5 g for the controls. Fig. 1 shows the typical inhibition effect on the tumor of the injection of A-Methopterin at the level of 1.5 mg/kg/day.

The tumors have never been completely destroyed. When the injections are stopped, the small tumors grow normally.

When the tumors were allowed to grow for 3 to 7 days before the injections were begun, inhibition of growth was apparent in practically all instances. Of the 15 groups of mice receiving 2 mg/kg/day, inhibition was marked in 3 groups, moderate in 11 groups and absent in one group. Of the 24 groups receiving 1.5 mg/kg/day, inhibition was marked in 7, moderate in 16, and absent in one. The death rates for the 2 dosages were 12% and 16%, respectively. It is doubtful that these figures represent true toxicity deaths, because many of the tumors were so large at the time injections were initiated, that some of the mice probably died from the effects of tumor growth. The effect of A-Methopterin was definite although not as marked as in the groups of mice injected 24 hours after implantation.

In a few experiments a single injection of 50 mg/kg was administered when the tumor had grown one day. An inhibitory effect was evident when the tumors were measured a week later. In one group implanted 24 hours previously which received one injection of 50 mg/kg, small doses (0.5 mg/kg/day) were administered for 7 days. When the tumors were measured, they were very small but grew when the injections were stopped. The development of 7-day-old tumors was not affected by the injection of the single large dose.

Discussion. A-Methopterin has been shown to have a definite and consistent inhibitory effect on the growth of the transplantable mouse Sarcoma 180. In another report (Sugiura, Moore, Stock)[4] the folic acid antagonist, Aminopterin, was shown to have a similar effect; however, marked inhibition could be demonstrated only when the drug was administered in amounts which killed a large per cent of the mice. A-Methopterin appears to exhibit a more favorable therapeutic index. It has been outstanding in its effect among numerous compounds which might interfere with the utilization of folic acid or possibly with the synthesis of nucleic acid. In fact, it has been the most effective compound of over 700 miscellaneous compounds that have been screened. It is therefore advanced as a compound worthy of further experimental study and for clinical trial in various types of cancer.

Summary. The compound 4-Amino-N[10]-methyl pteroylglutamic acid, has shown the ability to inhibit the growth of the transplantable mouse Sarcoma 180 when administered intraperitoneally in concentrations of 1.5 mg/kg each day for 7 days. At this dosage very few mice died from drug toxicity. The inhibition is most apparent when the compound is administered early in the development of the tumor.

TABLE I.
Effect of Different Amounts of A-Methopterin on the Growth of the Sarcoma 180.

Dose in mg/kg/day	No. of groups of 5 mice	No. of mice	Deaths during inj. period		Effect on tumor*			
			No.	%	Inconclusive	Marked inhibition	Moderate effect	No effect
2.5	6	30	14	46.6	2*	4	0	0
2.0	15	75	14	18.6	2	9	4	0
1.5	31	155	11	7.1	0	16	11	4
1.0	8	40	2	5.0	0	1	4	3

* The tumor effects are expressed as the result obtained in each group of 5 mice. Thus, the numeral 2 indicates two groups of 5 mice each.

Beneficial Effects of Liver on Growth and Survival in the Immature Hyperthyroid Mouse.*

B. H. Ershoff.
Emory W. Thurston Laboratories, Los Angeles, and Department of Biochemistry and Nutrition, University of Southern California, Los Angeles.

Available data indicate that desiccated whole liver will prolong survival and counteract the growth retardation of immature rats fed massive doses of thyroactive materials.[1-5] The protective factor is distinct from any of the known nutrients and is retained in the water-insoluble fraction of liver.[2-5] The present experiment was undertaken to determine the effects of liver and liver fractions on growth and survival in the immature hyperthyroid mouse.

[...]

Promising Molds. Dr. Rhoads and his associates believe that no possibility, even faintly promising, should be neglected. One long shot is to look for something in the secretions of molds. One such secretion, penicillin, has a differential effect on bacteria: it kills bacteria but leaves human tissue unharmed. Molds might conceivably produce something with a differential effect on cancer cells.

In a cold, air-conditioned room in Sloan-Kettering, various molds (green or white mats) are growing in flasks. The program is still young, but already one mold has been found that secretes a substance with a slight differential effect on mouse tumors. [] does not even want to talk about it yet. He has no "cancer penicillin."

Behind a door marked "No Visitors" (no one may enter who has not been properly immunized), works attractive Dr. Alice Moore, a leading virus fancier. "I'm a virus girl," she says, "so I thought I'd try 'em." She tried influenza virus on cancerous mice. No effect. She tried the virus of herpes (inflammation of the skin and mucous membranes). No effect.

Then she turned to the deadly virus of Russian spring-and-summer encephalitis, injected it into the abdominal cavity of cancerous mice. In about two days the firm, round tumors turned into blobs of pus. All the cancer cells apparently died. But the virus then went on and attacked the nerves and brain. Four days later the mice, apparently cured of cancer, died of encephalitis. Nonetheless, the virus had shown a dramatic differential effect. It went first to the tumor and thrived there before attacking the brain.

Try the Viruses. There is a long list of things that Dr. Alice can do now to exploit her discovery—so many things that Dr. Rhoads is enlarging her dangerous laboratory. **One is to try the encephalitis virus on monkeys.** The laboratory strain has lived so long in mouse brains that it may have lost its ability to attack primates. If it proves harmless to monkeys, it probably will not hurt humans. The final step will be to try it on human cancer patients to see if it attacks their tumors.

Another thing that Dr. Alice hopes to do is to grow her virus for a long time in mouse tumors, transferring it from mouse to mouse as the tumors die. When grown on new food, viruses often change their ways. Dr. Alice hopes that the encephalitis virus might be taught to give up its taste for brain tissue while increasing its appetite for tumors.

If all these methods fail, there are plenty of other viruses to try against cancer. Some of them, comparatively harmless to normal human tissue, may attack tumors. If some such virus could be found or developed, it would be an ideal anti-cancer drug. Circulating through the body like a ferret through rat holes, it could hunt down every gangster cell.

[...]

1949 Summary - "Alice Moore was the first scientist to test oncolytic virotherapy in an animal model. "

Working with Russian Far East encephalitis virus, complete regression was achieved in some cases of mouse sarcoma 180 - the first animal model to demonstrate full regression through viral oncolysis [7]. "

"Oncolytic virotherapy in veterinary medicine: current status and future prospects for canine patients"

In 1950s... (https://core.ac.uk/download/pdf/322438727.pdf)

"1. Targeting and mechanism of OV

Even in the absence of tools to genetically modify viruses in order to make them safer, in the 1950s, Alice Moore observed that it was possible to generate virus strains with higher oncolytic capacity and more tumor specificity through adaptation. In particular, the oncolytic features of Russian encephalitis virus were enhanced after 20–30 passages in the Sarcoma 180 cell line as compared to the original strain, leading to the idea that the tumor cells could exert an evolutionary pressure upon the virus, favoring those particles adapted to replicate in the tumor [122]. After the development of techniques for the manipulation of DNA, these tools were used to break down the barriers for the development of virotherapy. Thus, undesirable virulence could be mitigated by eliminating key genes from the viral genome, generating attenuated viruses. The viral genome often codes important proteins that regulate its replication in postmitotic cells. For example, the thymidine kinase (TK) gene is associated with DNA synthesis and cell cycle progression [123]. Taking advantage of this information, Martuza and collaborators showed that HSV lacking the gene coding for TK could replicate in dividing cells, but replication was hampered in quiescent cells, in line with the need for selective replication in tumor cells. In an animal model of glioma, locally administrated mutant HSV led to inhibition of tumor growth and showed decreased neurotoxicity [121]. Alternatively, the viral life cycle may be guided by cellular or virus-encoded microRNAs that alter the level of expression of cell-specific proteins [124]."

A Synthetic Chemical May Be Cancer Cure

By SCIENCE SERVICE

ATLANTIC CITY, N. J. — Search for a chemical cure for cancer has led scientists to investigate fungi, disease-causing viruses, male, female and adrenal hormones and synthetic chemicals from the textile industry.

One of these synthetic chemicals, called SK 1133, caused complete regression, or disappearance, of almost 100% of the highly malignant cancers called sarcomas, about 80% of carcinomas and about 40% of carcino-sarcomas in rats, Drs. Kanematsu Sugiura and C. Chester Stock of Sloan - Kettering Institute for Cancer Research, New York, reported at the meeting here of the American Association for Cancer Research.

A related chemical SK 1424, was almost as effective. The value of both chemicals in treating animal cancers was definitely greater than that of nitrogen mustard.

THE VIRUS of Russian Far East encephalitis, cause of the brain disease sometimes called "sleeping sickness", also showed striking anti-cancer activity, completely checking the growth of some animal cancers, though it was ineffective against others. The anti-cancer activity of the virus, however, is tied up with its disease-causing activity. The cancer in the mouse would be completely destroyed but the animal would always die of the virus infection. Study of this virus was reported by Dr. Stock and Dr. Alice E. Moore.

Anti-cancer but also toxic to the test animals was a substance from a fungus, Aspergillus fumigatus 943, investigated by Dr. Stock with Dr. H. Christine Reilly.

MORE ENCOURAGING was the report that mice expected to develop cancer of the outer part of the adrenal gland can be protected from this fate by pellets of male and female sex hormones and adrenal cortical hormones. Search for a substance with strong tumor-preventing effect without being a "strong sex hormone" is continuing and the outlook, Dr George W. Woolley of Sloan-Kettering reported, is hopeful.

1950 (July 25) - In Paris: "Fifth International Cancer Research Congress"

https://www.newspapers.com/image/109229307/?terms=%22Alice%20E.%20Moore%22&match=1

1950-07-25-the-eugene-guard-oregon-pg-8-clip-blood-test.jpg

Blood Test Proves Effective In Detecting Human Cancer

PARIS —(AP)— A new blood test has so far proved almost 100 per cent accurate in detecting cancer in humans, three Swiss physicians reported recently.

They told the Fifth International Cancer Research Congress the test is based on a chemical that appears in the blood of persons with cancer. The chemical breaks down a certain kind of sugar, pentose sugar. The test is made by adding blood serum from the person to a solution of the sugar.

The method was described by Dr. Georges Menkes, Dr. P. Rentchnick and Dr. S. Steenmf, of Geneva.

The test was tried, they said, on 200 persons with various kinds of cancer. It was 95 per cent right. An improved version was employed on the second hundred. Dr. Mankes said it was almost 100 per cent accurate.

Blood from 42 of 44 healthy persons produced no reaction on the pentose sugar, while 88 per cent of 124 persons with diseases other than cancer also showed negative reactions to the test, the Swiss expert said.

Rats were given a cancer-causing chemical. The sugar-destroying chemical appeared in their blood at the same time as the microscope showed cancerous changes in the rats' tissues.

The sugar-destroying chemical seems to be a constant and probably peculiar property of the blood of cancer patients, Dr. Menkes concluded.

The congress also heard a description of a new injection technique in which hollow tubes, pushed through human arteries, wind as far as five feet through the body to deliver cannon shots of drugs against cancer growths.

Dr. Michael B. Shimkin of San Francisco's National Cancer Institute said the tubes can carry large amounts of drugs to the site of the cancer. Twice as much of the drug injected into a vein would be greatly diluted before it reached the same site, he explained.

Drugs were given in this way to 50 patients, all dying of cancers, in the past year, Dr. Shimkin said. About half of them received temporary help and a few obtained an extra three months of life, he added. The drugs used were nitrogen mustards, made from wartime poison gases.

The tube method, Dr. Shimkin said, had proven safe and may become increasingly useful. The patient lies on a fluorscopic table and doctors watch where the tube, or catheter, is going. The patient gets a local anesthetic at the point of the tube's entry and doesn't seem to mind the process, the doctor added.

Two other reports at the session described the use of virus diseases to fight cancer. Smaller than basteria, the tiny viruses have to enter body cells to live and reproduce. If they get into cancer cells, they may be able to halt or slow down the cancerous growth.

A report from Dr. Shimkin and four other San Francisco experts—Dr. Howard A. Bierman, Dr. William M. D. Hammon, Dr. Bernice U. Eddie and Dr. Karl F. Meyer—said such diseases had been given to 16 persons suffering from cancer of the lymph glands or cancer of the blood, leukemia. Some recovered temporarily, for a few weeks or months, the doctors said.

Each virus administered was of a type that could be controlled or cut off with such modern antibiotics as aureomycin or chloromycetin. Diseases used included a virus disease of cats, a venereal disease called lymphopathia venereum and Rocky Mountain spotted fever.

Dr. Alice E. Moore of the Sloan-Kettering Institute for cancer research, New York, told of using another virus which causes Russian encephalitis. This dangerous disease, given mice, destroyed some kinds of cancer.

How Long for Stump? One is 25 Years Old

SOUTH BEND, Wash.—(AP)— How long will a stump live?

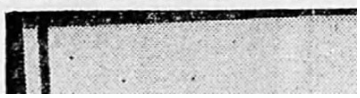
Two Douglas fir stumps from a 25-year-old cutting near Menlo are still alive, Mize Lazara, soil conservation service forester, said recently.

The stumps have calloused over and are continuing to show annual growth.

The reason?

Lazara said he believes that while the stump was a tree it had formed a natural root graft with another Douglas fir a few feet away.

The one tree was cut, but its stump continued to take life-giving and timber-building strength from the still-standing tree.



1951 (April) - Research : "Enhancement of Oncolytic Effect of Russian Encephalitis Virus."

Source : [HI002X][GDrive] / Alice E. Moore, First Published April 1, 1951 Research Article

- *Summary - By continuous passage in the transplantable mouse tumor sarcoma 180 it has been possible to increase the ability of the virus of Russian encephalitis to destroy this tumor. Conversely, continuous passage in the mouse brain resulted in a loss of oncolytic activity. In other experiments the virus of Russian encephalitis was changed by continuous passage in the Wagnar osteogenic sarcoma so that it caused destruction of this hitherto resistant tumor*

Enhancement of Oncolytic Effect of Russian Encephalitis Virus.* (18619)

ALICE E. MOORE. (Introduced by C. P. Rhoads)

From the Division of Experimental Chemotherapy, Sloan-Kettering Institute for Cancer Research, New York City.

In the study of the effect of neurotropic viruses on transplantable tumors in mice, it was found that the oncolytic action of these viruses was so closely associated with the neurotropism that the tumor bearing animals always died of the infection(1,2). If animals were immunized either actively or passively against the viruses no tumor destruction took place(3). It seemed possible that by continuous passage from tumor to tumor in cancer bearing animals, some change might be brought about in the tropism of the virus. That tumor destruction is not inevitably associated with nervous system injury was shown by Sharpless, Davies and Cox(4). They reported that both Russian and West Nile encephalitis viruses could cause the regression of the chicken tumor RPL-12 with the survival of the host.

For the past two years we have attempted to separate the neurotropic portion of the Russian encephalitis virus from its oncolytic portion. Although the objective has not been attained, certain changes have occurred in the affinity of the virus for tumor tissue. By continuous passage it can be shown that its oncolytic ability can be enhanced. As yet no marked change has occurred in its neurotropism.

Materials and methods. The methods used in trying to produce variant strains of virus from the parent or "stock virus" have been as follows: (1) Sarcoma 180 passages. Three types of passages are reported in this study. (a) Bi-weekly passage. Groups of 3 to 5 animals were implanted subcutaneously with tumors. When the growths were approximately 10 mm in diameter, 0.05 cc of "stock virus" was inoculated directly into the neoplasm. Three or 4 days later one animal from the group was killed, the tumor removed aseptically, and a 10% emulsion made in diluent. After centrifugation, 0.05 cc of the supernatant was inoculated into the tumors of another group of sarcoma 180 bearing animals. The remaining animals of each inoculated group were allowed to die of the infection and a record kept of their day of death and the condition of their tumor. (b) One- to 2-day passage. After 96 bi-weekly passages, another series was begun. The transfers were carried out in the same way except that inoculated tumors were removed and passed at one- and 2-day intervals. An attempt at daily tumor passage was abandoned because the virus was too readily lost. (c) Passage at higher dilutions. Numerous attempts have been made to make tumor to tumor passages after the virus has been diluted. A passage began with virus from the 117th bi-weekly passage diluted to 10^{-3} at the time of each passage had undergone 16 consecutive passages before testing. Continuous passage at higher levels (10^{-5}, 10^{-7}, 10^{-8}) have been difficult to maintain because of the possibility of diluting out the virus. (2) Brain Passage. The original "stock virus" was carried by transfer from brain to brain in order to have a comparison with the tumor to tumor passage material. 0.03 cc of 10% "stock virus" was inoculated intracerebrally and serial passages at that dilution were made at bi-weekly intervals. (3) Wagnar osteogenic sarcoma passage. Continuous passage was begun by inoculation of 0.1 cc of the "stock virus" directly into palpable Wagnar tumors. At intervals of 3 or 4 days, a tumor was removed aseptically, a 10% suspension made and 0.1 cc of centrifugate inoculated into the same type of neoplasm. *Virus.* The virus of Russian Far East encephalitis was used throughout these experiments.§ Whole mouse brains were kept frozen at −40°C in the dry ice chest. They were prepared from a single stock of brains so that all virus used and referred to as "stock virus." were at the same level of passage. All dilutions were made in 10% inactivated horse serum in physiological saline. *Titrations.* All titrations for virus content of brain and tumor were made with white mice of 18-22 g in weight obtained from commercial breeders. For intracerebral titrations 0.03 cc amounts were employed, and for the subcutaneous and intraperitoneal titrations 0.05 cc was inoculated. *Detection of changes in the virus.* Although virus variation is a recognized phenomenon the detection of variants, especially if present in small amounts, is very difficult. In the studies here reported if a "pure strain" oncolytic variant without effect on normal tissue appeared, it would be possible to detect it only by its activity against a transplantable tumor since intracerebral inoculation would produce no disease. It was necessary, therefore, to set up a standard procedure which would detect any increase in the oncolytic activity of the virus. The test for changes in activity of the sarcoma 180 passage viruses and the brain passage virus was done as follows: Mice bearing sarcoma 180 implanted 4 days previously, were inoculated intraperitoneally with 0.05 cc of a 10^{-3} dilution of virus. The inoculated virus was always titered intracerebrally and usually intraperitoneally and subcutaneously. The day following inoculation tumor and brain were removed and the amount of virus contained in each was determined by intracerebral titration. At the same time 2 mm cube pieces of tumor were implanted into virus immune but tumor susceptible mice to determine its viability (bioassay). The same procedure was done 3 days and occasionally 7 days after the original inoculation of virus.

§ Received through the courtesy of Dr. J. Casals of Rockefeller Institute.

The time at which the sarcoma 180 is destroyed following intraperitoneal inoculation with "stock virus" at different dilutions has been determined. It is possible therefore to detect, by the method described, any increase or decrease in the oncolytic ability of the virus consequent to a procedure designed to modify that ability.

The same type of test was used for the detection of changes in the tumor effect of the Wagnar passage virus. After a number of serial passages, the virus was tested against the Wagnar tumor by inoculation of 0.05 cc of a 10^{-1} suspension of virus intraperitoneally. At the same time the "stock virus" was inoculated in the same dilution into a comparable group of tumor bearing animals. Previous experiments† had shown that in the dilutions inoculated this virus has been ineffective in causing tumor destruction. When the animals became paralyzed, usually 6 or 7 days after the inoculation, 2 or 3 from each group were killed and the viability of the tumors determined by implantation into virus immune animals. Titrations of brain and tumor were carried out at the same time. *Tissue culture.*‡ The results obtained in animals with the sarcoma 180 passage and the brain to brain passage were confirmed by tissue cul-

Per cent of Sarcoma 180 destroyed at one and three days following intraperitoneal inoculation of 0.05 c.c. of 10^{-3} dilution of Tumor to Tumor and Brain to Brain Passage.

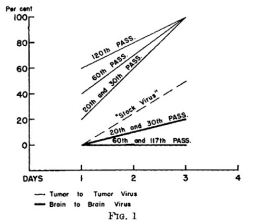

FIG. 1

† To be reported.

‡ The author wishes to thank Dr. C. Friend who performed these experiments.

ture technics. One flask containing a simple Maitland type medium consisting of 4.5 cc Tyrode's solution, 0.5 cc normal horse serum and minced tumor was inoculated with 0.5 cc brain passage virus at a dilution of 10^{-3}. A comparable flask was inoculated with the tumor passage virus. Twenty-four, 48 and 72 hours later 10 tumor pieces along with tumor from a control flask were removed and implanted into immunized mice to determine their viability. Titrations of the supernatant were also carried out.

Results. Sarcoma 180 passage compared with brain passage. After 20 passages it was apparent that the bi-weekly tumor to tumor passage virus was destroying the tumor to a greater extent than the brain to brain passage, and further passage has resulted in an increase in the oncolytic effect of this virus while the brain passage has lost its ability to attack the tumor in the 3 day period. In fact bioassay experiments with the 128th brain to brain passage showed that only 30% of the sarcoma 180 was destroyed 7 days after inoculation, whereas inoculation of "stock virus" invariably destroys 100% of the tumor in the same length of time. The results are shown graphically in Fig. 1. Table I gives the detailed information obtained from the bioassay experiments. It can be seen that in each test but one, the inoculated brain to brain passage virus had a higher intracerebral titer than the tumor to tumor passage so that the tumor destructive ability of the latter virus can not be due to an increase in the number of infective virus particles. The titers of brain and tumor from animals killed one and 3 days after inoculation show no great consistency. In general the tumor passage virus appears in larger amounts in the tumor than does brain passage virus (5 of 8 instances) one day after inoculation, whereas 3 days after inoculation both passages are more apt to be present in nearly equal titer (5 of 8 instances). Obviously the intracerebral titer has little bearing on whether a tumor is destroyed since tumors of animals inoculated 3 days previously with brain to brain

Control tumor pieces exposed for the same length of time in the same medium grew in 100% of the instances.

passage have high titers and yet the virus has no ability to destroy the tumor tissue.

If the neurotropism of the tumor to tumor passage virus were decreased one would expect to get some survivors among the passage mice. This has happened in scattered instances but the total number is not very impressive—10 in 349 animals injected. However, when one realizes that 0.05 cc of a 10% suspension of virus is inoculated (approximately 1,000,000,000 LD_{50}'s) any survivors at all have special interest. None were observed in the brain to brain passage. The animals which survived with regressions of tumor were immune to challenge by fully virulent virus and, in most instances, reimplantation of sarcoma 180 resulted in failure of the tumor to grow. The results of testing 2 of the one to 2 day sarcoma 180 passages are shown in the last 2 experiments in Table I. So far these appear to be of the same order as the bi-weekly tumor passage and about the same number of survivors (14 out of 438) have been obtained. It was hoped that in this manner the particles of virus having strong tumor affinities could be selectively passed. One test of the 10^{-3} passage after 16 passages showed it to be similar to the other tumor to tumor passages.

Tissue culture experiments. Effective destruction of tumor by the Russian virus can also take place in tissue culture. Therefore the tumor to tumor passage and the brain to brain passages were tested by this means to see if the differences observed in animals could be confirmed. The set up of the test is given under *Methods.* The results obtained are given in Table II. The *in vitro* experiments showed no great difference between the brain to brain and tumor to tumor passages on the growth of the sarcoma 180 at the level of the 48th passage. However the 107th passage showed a difference between them. In this instance the tumor to tumor passages tested showed a much greater ability to destroy the tumor than did the brain to brain passage whose ability in this direction appeared to have decreased.

Wagnar passage virus compared to "stock virus." At regular intervals during serial passage, the virus was tested by bioassay experiments in the manner previously described to ascertain if it had acquired the ability to cause tumor destruction. "Stock virus" was tested in exactly the same manner each time for comparison. A summary of these experiments is given in Table III. It is clear that the Russian encephalitis virus, by continuous growth in a non-susceptible tumor, has been changed so that it is now capable of causing its destruction.

Discussion. From the results presented two conclusions can be drawn: (1) the oncolytic activity of the virus of Russian encephalitis for a susceptible tumor can be increased or decreased quantitatively by suitable procedures, (2) the activity can be modified, qualitatively so that it will cause destruc-

tion of a cytologic type of tumor which was originally resistant to the parent virus. These results were obtained by continuous passage of the virus in tumor or in brain tissue for relatively long periods of time. The changes in viral activity which occurred with passage were gradual. They show little indication of a discontinuous variation (mutation). Rather the product viruses can be looked upon as adaptive variants of the parent strain. They have retained their ability to attack nervous tissue and have changed only in their destructive capacity for tumor.

Viruses are well known for their capacity to vary with respect to the type of tissue which they can invade and injure. An understanding of the mechanism by which this takes place awaits further work on virus-host relationships but we can speculate on some of the possibilities, with reference to the present results with the strains.

If one thinks of a virus population as containing a number of variant particles, and there appears to be much evidence for this concept(5), it is conceivable that the above results were the result of selection. According to this interpretation the particles responsible for the neurotropism of the virus would have remained constant in number while the ones responsible for the tumor effect would have increased or decreased.

Another possibility resides in the make-up of the virus itself. At one point virus reproduces itself within the tumor without injury to its host cells. After long passage in that tissue the ability to destroy it is acquired by the virus. The transition is a gradual one. The process is reminiscent of the acquisition, by other forms, of the capacity to metabolize substrates after many generations of contact with them(6). It is conceivable that there exist in certain neoplastic cells specific components required for the anabolic processes of their reproduction. These may well be of the nature of nucleic acid precursors(7), and may be similar to those required by viruses(8). By continuous growth in a medium containing these components the virus may achieve the capacity for metabolizing one of them which is essential for the growth of the tumor cell. In this fashion a minor adaptive variation could endow a virus with oncolytic properties.

Still another possible explanation for the observed results may be offered. It has been shown that variant viruses may have different rates of growth(5) and it may be that the tumor trophic viruses become more rapidly adsorbed to the susceptible cell or that they may multiply more rapidly within the cell.

Summary. By continuous passage in the transplantable mouse tumor sarcoma 180 it has been possible to increase the ability of the virus of Russian encephalitis to destroy

- DOI: 10.4269/ajtmh.1951.s1-31.724

Abstract only from Semantics Scholar :

- *West Nile, Ilheus and Bunyamwera viruses have been inoculated into patients with advanced inoperable neoplastic diseases in hopes of inhibiting the neoplasms. The course of infection of man by these viruses has not previously been known. Results of this study have been presented, with emphasis on the clinical picture and virology.*
- *West Nile produced an asymptomatic infection in 5 of 21 patients inoculated.*
- *Ilheus virus infected 9 of the 19 patients inoculated. It caused mild encephalitis in 3 patients, and in the other patients caused no symptoms.*
- *Bunyamwera virus caused a very severe encephalitis with residual mental damage in one patient. It failed to infect 3 other patients.*
- *There was no significant effect on growth of the neoplasms, but localization of virus in tumor tissue was demonstrated in some patients with each of the 3 viruses.*

Scientist Describes Virus That Kills Cancer in Mice

NEW YORK, Nov. 16 (INS)—Cancer research authorities said today that tests show some viruses may cause cancer while other viruses can destroy tumors in experimental animals.

Progress in the war on cancer, America's No. 2 killer, was reported by 31 outstanding leaders in the field attending a two-day conference sponsored by the New York Academy of Sciences under a grant from the Damon Runyon Memorial Fund.

Dr. Alice E. Moore, head of the virus laboratory at the Sloan-Kettering Institute for Cancer Research in New York, told the group of her experiments with cancer "killer" viruses.

Her paper reported how the virus of Russian encephalitis destroyed tumors in mice—but then killed the mice by attacking the brain.

Dr. Saymour S. Cohen, of the Children's hospital of Philadelphia, said that in cells affected by viruses, "several kinds of distortion of the normal growth pattern has been observed "in laboratory tests.

In another paper, Ludwik Gross and Kenneth S. McCarthy of the Veterans Administration hospital in the Bronx, said certain spherical "particles" found in human milk may be responsible for breast cancer.

They said: 'Examination of 71 milk samples obtained from women having a presumably negative record for cancer revealed in 29 of them either large or fairly large quantities of particles; 32 contained only occasional particles in some of the electron microscopic fields examined, and 10 had no particles at all.

"The results thus far obtained do not, therefore, exclude the possibility that human milk samples may contain a tumor agent . . ."

Yale Scientists May Have Answer To Virus Diseases

New York—(U.P.)—Two Yale university scientists reported today on a laboratory experiment that may lead to an effective weapon against virus diseases.

The scientists, Dr. F. and M. L. Duran-Reynals, of Yale's university of medicine, have found that an enzyme known as hyaluronidase will inactivate certain types of viruses. Their report was published in the magazine Science, of the American Association for the Advancement of Science.

The experiment may be a key to the riddle of how the body fights off infection of viral agents, and more significantly it may result in clinical use of the enzyme to prevent spread of a virus.

The common cold, polio and mumps are caused by a virus, and there has been some evidence that a virus may cause certain types of cancer.

The Yale scientists obtained the hyaluronidase from two sources, from human umbilical cord, and from the eye ball fluid of cattle. The substance was isolated and purified. It was then added to a solution along with two types of virus.

The results, according to the scientists, "were significant." The enzyme either cut down the number of viruses, or completely put them out of action.

It was found that the free hyaluronidase had more effect on the viruses than preparations rich with hyaluronic acid.

should be drawn from the work.

The scientists said no conclusions but that if the results do duplicate what happens in the organism during infection, it could be assumed that hyaluronic acide and other related substances, can inactive infectious agents, such as viruses.

"If this were so," they said, "the substance, besides being a mechanical barrier, would also be a sterilizing barrier to progress of infection."

They said that Dr. Alice E. Moore, of the Sloan-Kettering institute, New York, had used some of the preparation on the virus of Russian encephalitis, and that preliminary results showed it put the virus out of action.

AT KETTERING INSTITUTE

Dr. Seymour S. Kalter, assistant professor of bacteriology and parasitology, and Dr. Stanley Batkin, instructor in medicine, State University College of Medicine, have spent the past two days at the Sloan Kettering Institute for Cancer Research studying technics of destroying tumor growths by virus. Dr. Alice E. Moore is head of the virus laboratory there.

Woman Doctor Trains Viruses To Attack Cancerous Growths

By WILLIAM MANCHESTER
[Sunpapers Staff Correspondent]

New York, March 26—Training deadly viruses to attack tumors by feeding them a steady diet of cancer tissue is the purpose of research being conducted here by Dr. Alice E. Moore, former head of the yellow-fever vaccine department of the Rockefeller Foundation and now an investigator at the Sloan-Kettering Institute for Cancer Research.

The idea is that if the viruses develop an appetite for cancer, they may leave normal cells alone and feed on just the malignant tissue in a patient's body.

Although her work largely remains in the realm of theory after years of experimentation, including some with doomed human subjects, Dr. Moore has found that the behavior of certain virus strains can be changed—that they can be given appetites for tumor cells.

Lie In Twilight Zone

Viruses lie in a twilight zone between living and dead matter. They are, for the most part, made up of complex protein molecules and a nucleic acid. They can infect human beings with diseases ranging from colds to polio.

They are known to be what science calls "specific agents"—that is, they go after certain tissues. This characteristic was the starting point of Dr. Moore's research.

She first infected cancers in mice with influenza and with the herpes virus which causes cold sores in mouths. The viruses grew in the cancer but they didn't do it much damage, and so she turned to other agents.

Tried Encephalitis Virus

She hit upon the highly virulent Russian encephalitis virus. When ground up into a deadly broth and injected into cancerous mice, "the Russian," as Dr. Moore calls the virus, tended to concentrate in the tumor.

It worked better in some cases than in others. Of twelve mouse tumors, it completely destroyed six, a few others were inhibited. The rest were unaffected.

Unfortunately, all the mice died of Russian encephalitis.

"We had what you might call an inferior cancer cure," Dr. Moore says. "We could have done as well with a mousetrap."

But she did not expect to find a virus which would behave perfectly, multiplying in the tumor, destroying it and then going away without any damage to normal cells. She knew such an agent was unobtainable.

One Trained For Year

It was then she decided to train virus's appetites.

One virus was trained for a year. In the beginning, it was no more effective against cancer tissue than normal tissue. But after 80 passages—80 mice, that is—it completely destroyed mouse tumor before turning on other cells.

Other viruses also acquired a taste for cancer. One strain took six days to knock out a tumor when first given a tumor meal. After many passages it had become ravenous and did the job in 24 hours.

"We have found that a number of viruses attack the tumor and destroy it first," Dr. Moore says. "We know now we don't have to kill the mouse to do it. And we know a virus can be changed."

Some "Melt Away"

In some experiments, she said, the tumors "melt away." Certain strains of "the Russian" go directly to the cancer and feast only there. No traces of them can be found in a mouse's blood.

"The Russian" was considered too deadly for human patients. But some patients for whom all other methods of treatment had failed were inoculated with certan encephalitis strains which had turned up in yellow-fever surveys—the West Nile and the Bunjamwera viruses from Africa, and the Ilhéus virus, from the Amazon Valley.

Use of the Bunjamwera was discontinued when it infected its fourth patient with the encephalitis, an incurable disease. The other strains are still under study in humans.

Rats Get Inoculations

Dr. Moore is now working with Dr. Helene Wallace Toolan, whose contribution has been the growing of human tumor tissue in rats.

When a tumor is removed from a patient, it is taken directly from the operating table to Dr. Toolan, who grinds it up and inoculates rats with the broth. Of twenty rats so inoculated, she keeps ten. She gives the other ten to Dr. Moore.

Dr. Moore's rats receive viruses. Dr. Toolan's don't. Both groups are observed to see if the cancers in Dr. Moore's rats go away and those in the others stay.

When the doctors find a virus works against one of the human tumors thus transplanted, they keep a sharp eye out for the patient from whom it was taken. If he shows up with another tumor, and he may, there is an excellent chance it will be just like the first tumor and therefore amenable to treatment from that virus.

Curiously, Dr. Toolan has been able to grow normal human tissue, as well as human tumors, on rodents. Skin taken from the abdomen of a 72-year-old woman during an autopsy has been grafted onto a rat.

Greenville Daily Advocate (Greenville, Ohio) · 08 Apr 1952, Tue · Page 3

FORMER OHIO WOMAN DOCTOR REPORTS ON CANCER RESEARCH

NEW YORK — (U.P.) — Dr. Alice E. Moore, formerly of Bellevue, O., shuttles between a carefully guarded laboratory and a tiny, brick-walled office where she studies results of the unique cancer research department she heads.

The locked laboratory is opened only to doctors and technicians who have been vaccinated against deadly Russian encephalitis. Dr. Moore, a brisk grey-haired woman of 44 with a ready sense of humor, heads the virus section of the Sloan-Kettering Institute.

For three years the section has been searching for a virus which would destroy cancerous tissue. At first the experiments were done only on mice. Now viruses are injected into cancer patients in the hospital.

"The thing that makes the experiments unique in the field of cancer research is that we're using a living agent—virus," Dr. Moore explained. "But we definitely have not found any cure. I don't believe in giving people false hope."

She was sitting in her office which smelled strongly of ether and disinfectant, nine floors below the locked laboratory. On the walls were several humorous sketches of mice discussing their health problems with one another.

"We've never found any need to inject ourselves with any of the viruses to see how they react," she said, referring to herself and her staff of four other women doctors and a dozen technicians. "It would be very dramatic, but we haven't done it."

So far the staff has proved "that some viruses will destroy some transplantable tumors in mice and rats." Dr. Moore continued cautiously:

"We say that the results are encouraging—but to us, not to patients. After injecting patients, we have found that the virus does not collect in the tumor."

Russian encephalitis virus, the most effective in killing tumors in mice, can't be used on humans at this stage because of its deadly effect.

"It cures the cancer, but it always kills the mice," Dr. Moore said with a sigh.

LATENT OR DORMANT VIRAL INFECTIONS

By Hilary Koprowski
Lederle Laboratories Division, American Cyanamid Company, Pearl River, New York

The purpose of this paper is to review some of our knowledge concerning latent virus infections, in the hope that such a survey of the distribution, variety and behavior of these infections may facilitate the study of the neoplastic processes in man and in domestic and laboratory animals. I shall purposely avoid giving a definition of latency, since, if a broad, ecological view of the phenomenon of survival of parasites in nature is taken, it becomes clear that the stabilization of the host-parasite relationship cannot be based only upon the multiplication of virus at the expense of destroyed cells. It is much more probable that, in many instances, a latent virus persists in its host-cell as an innocuous symbiont, with a capacity to shed virulent variants only in rare cases.[1] Thus, if the broader view is adopted, a paper on latency of viruses should really encompass all known viral infections of plants, animals and insects. This would obviously be much beyond the scope of this presentation. Therefore, following a brief discussion of the methods of detection of dormant viral infection, examples of only a few such infections will be described in detail and the others mentioned briefly.

Detection of Latent Infection. An inapparent infection may become apparent and cause signs of disease in its host whenever the delicate equilibrium between parasite and host is upset. This may be caused by a change in environmental conditions, by a disturbance of the physiologic equilibrium of the host, or by any other factor or factors of a nature as yet undetermined.

More commonly, a dormant virus infection may be detected by a careful examination of either animal or plant tissues, the cells of which are suspected to contain these viruses. If the latter is visible and morphologically identifiable, then such methods as electron microscopy can be used successfully for that purpose. In other instances, transplantation of the material into other animal or plant species, with resulting signs of infection, may constitute proof of latency. The demonstration of a specific antigen in the suspected tissue by serological tests may sometimes be the means of detecting an inapparent viral infection.

Finally, if the latent virus is able to evoke an immune reaction in its host, detection of specific antibodies and/or resistance to reinfection with the homologous agent may be considered as an indication of persistence of the virus in inapparent form in the host.

Obviously, these methods and techniques are neither exact nor exhaustive but they cannot be improved until our knowledge of the intricate mechanism of infection of living cells with viruses becomes more comprehensive. There seems to be little doubt, however, that many instances of latent infection escape notice because of the inadequacy of existing methods of detection. These reservations should be borne in mind during the ensuing discussion.

Latent Viral Infections of Mammals. In a discussion of latency of viruses, herpes simplex and rabies infections represent two contrasting problems in the extreme. Herpes simplex is a classical example of latent infection in man. The virus is dormant in the majority of human beings[2] and there are many flaring factors which may provoke the quiescent virus to appear. They may be listed as fever (induced or due to infection), cold, menstruation, exposure to sun, and, last but not least, emotional upset.[3]

Conversely, our knowledge of possible latency in rabies is very slight, and it is obvious that an answer based solely on observations in man would be inadequate. It should be pointed out, however, that circumstances surrounding the transition from the inapparent to the apparent infection in rabies may tend to incriminate certain factors. Intensive Pasteur treatment, for instance, was associated with shorter incubation periods of the disease[4] and emotional shock was thought to precipitate an attack of rabies in an exposed individual.[5] One case, that of a young boy bitten by a rabid dog, possibly merits detailed description. After exposure, the boy received

TABLE 1

* Five months later.

the full course of antirabies vaccine treatment and showed no signs of illness. Five months later, he became ill with bacterial pneumonia and while recovering began to exhibit signs of involvement of the central nervous system and later died of rabies.[6] Although coincidence of a prolonged incubation period cannot be ruled out in this case, the circumstantial evidence seems to demonstrate that the upset of the rabies virus-host cell equilibrium was caused by a febrile disease.

Evidence of viral latency in herpes simplex and rabies infections may be obtained in laboratory animals. Rabbits remained well, after either intramuscular or intravenous inoculation with herpes virus, but subjection to either anaphylactic or histamine shock invariably precipitated a severe encephalitis in the inoculated animals, and herpes virus could be demonstrated in the brain tissue. Characteristic pathological changes observed in the shocked animals were lacking in the control animals.[7, 8]

In the case of rabies, injection of Syrian hamsters seemed to provide a possible clue to the mechanism of its latency. When exposure to street virus was followed 24 hours later by administration of rabies antiserum, the

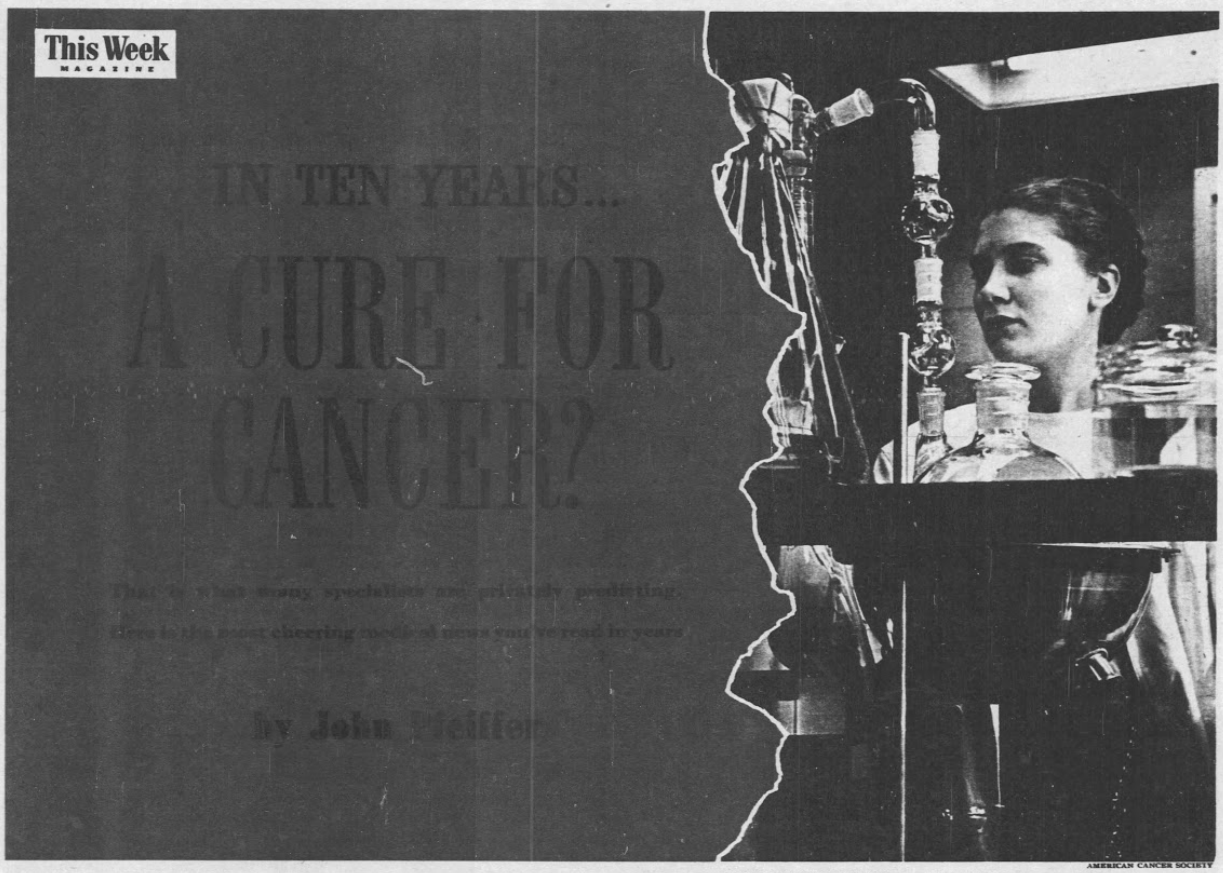
IN TEN YEARS...
A CURE FOR CANCER?

That is what many specialists are privately predicting. Here is the most cheering medical news you've read in years

by John Pfeiffer



AMERICAN CANCER SOCIETY

BOOM IN RESEARCH is opening exciting new possibilities for medicine

SCIENTISTS are closing in on cancer. That good news summarizes the views of most specialists I have interviewed in a survey of the battle against cancer.

They're looking forward to radically new treatments and cures in the foreseeable future, and 10 years seems to be the most popular prediction. But they won't talk about it, at least not in public. Last winter a usually reliable reporter quoted one leading cancer researcher to the effect that a cure would be forthcoming in five to 10 years. The statement was later denied.

Yet if the hunches of other investigators are any sign, it wasn't a bad guess, whoever made it! The director of a large eastern cancer hospital recently came up with an equally confident forecast (off the record, of course). He told me that he expects to see the cancer problem cracked "before the end of my active professional career" — and he's scheduled to retire in 10 years.

Another specialist says five to 15 years; still another speaks of "a decade or so."

These educated estimates are subject to qualification, of course. A third world war would be sure to disrupt cancer planning. Furthermore, the future is not clearly in focus. As soon as physicists split uranium before the war, the release of atomic energy became a matter for precise scientific prediction. No one has yet come up with a similarly crucial finding in cancer research.

Danger from Quacks

THIS is why some authorities, including spokesmen for the highly regarded American Cancer Society, refuse to go on record endorsing definite deadlines. And, of course, they have to be doubly careful. Cancer quacks still continue to prey on the fears of bewildered patients with claptrap about "miracle" cures, available *now*.

But — and this is the chief source of hope — basic research in biology is entering a boom period as exciting as that of atomic physics during the late 1930's. Although the secret of cancer has proved exquisitely elusive, science exists to deal with exactly this sort of problem. There is a feeling that we are on the verge of major advances. **Despite the reluctance of the experts to see their private remarks in print, work already under way explains their cautious optimism.**

The accelerating drive to curb cancer is being supported by the American Cancer Society, the National Cancer Institute and other agencies. It can be illustrated by three broad new avenues of approach: 1) the use of tumor-destroying viruses unknown a few years ago; 2) controlling the body's output of growth-affecting hormones by surgery and other methods; and 3) the search for new chemicals, "magic bullets" designed to kill cancer cells as effectively as conventional drugs kill germs. These studies are selected as examples from the mass of work that is modern cancer research. They are *not* listed in order of importance — we don't know enough at this stage to do that. But they hint strongly at the shape of things to come.

Anti-Cancer Viruses

OVERLOOKING a church near Manhattan's East River is a small ward in the James Ewing Hospital of the Memorial Center for Cancer and Allied Diseases. The ward has beds for only 10 patients. But it's the site of one of the most original and promising projects in the vast fight against cancer. During a recent visit I watched a procedure which, in itself, isn't particularly impressive. You've seen it many times. A doctor simply injected some milky white fluid into the right arm of a middle-aged woman.

What the fluid contained, however, is something else again. The doctor had carefully explained things to the patient — he was purposely injecting her with a colony of thriving viruses.

1,000-to-1 Gamble

LIKE all such agents, they were submicroscopic (25 million could be placed on the head of a pin) and attacked living cells. Only these parasites wouldn't hurt her. In fact, they had been selected because they were natural enemies of cancer cells and did negligible damage to the normal variety.

These injections are the result of a thousand-to-one medical gamble that is beginning to pay off. More than four years ago Dr. Alice E. Moore, Memorial's virus expert, launched a search for anti-cancer agents. She had no direct proof that such viruses existed. But she knew that all of them have finicky appetites. Some feed exclusively on lung tissue;

Continued from page seven

others, like the polio parasite, head for the cells of the brain and nervous system. Perhaps a type might be found which preferred cancer cells.

Flu viruses had no effect on mouse tumors. Neither did the viruses that cause cold sores or "fever blisters" on the lips. Dr. Moore tested viruses lurking in the bodies of ticks, rabid dogs, mosquitoes trapped in the jungles of Brazil and Africa. Several slowed down animal cancers, but cautious trials in patients gave little encouragement. Still no luck.

"Egypt 101"

THEN 18 months ago Yale doctors were testing blood samples obtained during a routine health survey from 250 children in a village near Cairo, Egypt. In the blood of Case No. 101, a two-year-old boy, they discovered a new virus, called it "Egypt 101" and sent it to Dr. Moore. The virus soon turned out to be a cancer-cell killer in mice, and is now being tested in men.

More than 125 patients have received shots of Egypt 101 and related viruses. Preliminary results show that temporary relief is obtained in certain tumors affecting the spleen, liver and lymph glands — and in cancer of the large intestine. According to a recent medical report, the latter condition "has never before responded even temporarily" to newer techniques. Egypt 101 can stop the growth of large-intestine cancers and, in several cases, has caused them to shrink by as much as a third.

A serious problem, however, is that the patient becomes immune to this particular virus. The body doesn't always know what's good for it. Mistaking the viruses for dangerous invaders, it throws up successful defenses and beneficial effects wear off. The expanded virus program includes research aimed at combatting this reaction, and "training" other viruses to do a better job.

Hormones and Surgery

IMPORTANT advances are being made in hormone research as well as virus research. A progress report of the American Cancer Society puts it this way: "A vast new field in the use of hormones — products of male and female glands — has opened in the past five years. True, they do not cure, but they often halt cancer growth and give relief from pain. Hundreds of men with cancer of the prostate and women with cancer of the breast have been enabled to return to something like a normal life through use of these hormones."

A new approach to the hormone problem is an operation developed by Dr. Charles Huggins of the University of Chicago. Cancer surgery usually means the direct removal of affected tissues. Dr. Huggins uses a different technique. He does not operate at the side of malignant growths; he changes body processes that keep tumors alive; he removes two small organs which are not afflicted with cancer themselves but seem to influence the disease by "remote control" — the adrenal glands, yellowish bodies about the size of orange segments, perched like three-cornered hats atop each kidney.

Incidentally, the odds are that this operation would have been fatal five years ago. Patients without adrenal glands must be supplied with the missing adrenal hormone, cortisone, and this substance hadn't yet been discovered.

One of the Chicago surgeon's patients is a 47-year-old housewife who was suffering from advanced breast cancer. She was bedridden and had only a few months to live at best. The operation halted the disease in its tracks. Today, 19 months after surgery, she is back home taking care of her family. "She feels so good," Dr. Huggins told me, "that she's eating too much and is on a reducing diet." Another patient, a man in a similarly hopeless state before his adrenals were removed, has worked 16 months as a boilermaker.

The Other Side

THIS is the sunny side of the story. If it were the whole truth, we wouldn't be looking ahead to the next 10 years — and we wouldn't avoid talking about "miracle" treatments. The two cases described above are not cured. Judging by past experience, benefits will not last indefinitely and the disease may flare up again without warning. Dr. Huggins is using the procedure for advanced breast and prostate gland cancer only. It isn't effective against other types.

A sober appraisal, however, reveals why surgeons at the Mayo Clinic, the Cleveland Clinic and the Massachusetts General Hospital are following Dr. Huggins' lead. About half of the 80 patients he's operated on have been dramatically relieved. Investigators don't yet know why, but one theory is based on observation that adrenal glands step up activity whenever your body is subjected to stress.

Cancer — like such conditions as arthritis, severe injury and emotional conflict — makes a heavy demand on these organs, It may require extra supplies of cortisone. By removing the adrenals and administering just enough of the hormone for normal tissues, doctors may be "starving" cancer cells. Whether or not the theory stands up, special surgery and other ways of controlling hormone balances will continue to yield important facts about the nature of malignant growth.

Hunting For Chemicals

BUT measured in terms of time and money spent, the greatest effort of all is going into a search for new cancer-killing chemicals. According to one view, cancer cells are simply super-stubborn parasites like germs and viruses. If so, there ought to be "magic bullet" substances to destroy them the way known drugs destroy bacteria. As a matter of fact, substances which show this ability — to a limited extent — have been widely used during the past few years.

Dr. Sidney Farber of the Harvard Medical School has conducted pioneer tests of a drug known as a-methopterin. His patients are about 350 children suffering from acute leukemia, a cancer of the blood. The chemical structure of this drug resembles that of one of the B vitamins — a vitamin, by the way, which cancerous blood cells require in their diets. The resemblance is so close that the abnormal cells can't tell the difference. They are fooled into devouring liberal doses of a-methopterin and by the time they discover their mistake, it's too late. They die of poison.

The Immunity Problem

USING the so-called "anti-vitamin" and similar drugs, Dr. Farber reports relief from certain forms of leukemia and an increased life span in two thirds of all cases. His prize patient, a nine-year-old girl, has already exceeded doctors' most optimistic hopes. She is alive today, almost five years after the start of her disease.

But such drugs cannot yield permanent results. Strangely enough, that doesn't necessarily mean new chemicals must be more effective. Two or three chemicals, each as good as a-methopterin and no better, might revolutionize the treatment of acute leukemia. And that goes for other types of cancer. The substances we have now work only for a while, because cancer cells gradually build a powerful resistance to them.

You may have come across a similar problem in your home. You can kill armies of houseflies with DDT, but a few of the insects may inherit "anti-DDT" genes

Continued on page 24

IN TEN YEARS — A CURE FOR CANCER?

Continued from page twenty-two

from their parents. The hardy offspring multiply rapidly in places dripping with the insecticide. The secret of fighting resistant houseflies — and perhaps, cancer cells — is to mix your weapons and use multi-drug combinations that can wipe out all enemies in a single blitz attack.

Screening Program

CANCER researchers have high hopes of developing such sudden-death measures. That's one reason why they're testing every new compound they can get their hands on — and testing it as quickly as possible. This is an unprecedented race against time.

Four chemicals are tested on standard mouse tumors every hour of the day at the Sloan-Kettering Institute in New York, the world's largest screening center. All substances, even the most unlikely, go through the same routine. One chance in a million is worth taking.

A grand total of 16,000 materials have already been screened. About 15 have been judged suitable for human trials and are either under investigation or about to be investigated. All widely used antibiotics such as penicillin and streptomycin have been tested with negative results. But animal trials of an extract of one soil-dwelling mold known as *Aspergillus fumigatus* were reported over two years ago, and studies of other antibiotics are continuing.

Natural Accelerators

SUCH tests are definitely on the experimental side. Chemicals being used now will not cure cancer. Neither will the Egypt 101 virus or adrenal surgery. But things look brighter for many reasons. **Basic studies of living cells are making sense out of a mass of hitherto unrelated facts.** The studies are under way at hundreds of large and small laboratories throughout the nation.

In other words, cancer is being attacked at a fundamental level, and such work has paid off handsomely in the past.

Furthermore, the pace of study has been stepped up tremendously during the last few years as physicists, biologists, chemists and specialists from many other fields join together in a great team effort. More activity will be concentrated in the coming decade than in any other previous decade in the history of cancer research. These are the facts that encourage many investigators to make off-record statements that important advances are in sight.

Meanwhile the situation today is not nearly as dark as some people believe. **Despite the fact that cancer is a mystery still, the over-all cure rate for all types of malignant conditions is more than 30 per cent.** Specialists are not waiting for the results of future research.

Important advances have been made in time-tested methods of treating the disease, notably conventional surgery and radiation. Cure rates for some kinds of cancer have doubled or tripled during the past decade.

Early Analysis

FINALLY, it is impossible to exaggerate the importance of early detection. A simple test for the diagnosis of early cancer, especially cancer of internal organs, would send death rates tumbling—even if doctors never learned a single new fact about the disease. Although the ideal test has not been discovered, already there are encouraging developments. For example, one new test can spot early-stage stomach tumors smaller than the nail of your little finger.

As for the future, the big point is that cancer cells can no longer be regarded as invulnerable enemies. They are being hit harder than ever before — and from more directions.

Here's what one brilliant young researcher has to say: "We're coming to grips with the problem. We wouldn't be working as hard as we are, if there weren't prospects for new cures that will surpass the ones available now. I'm confident that the next ten years will see major break-throughs on the entire cancer front." *The End*

Summary and Conclusions :

- *Serial specimens of human serum were studied for the presence of anti-virus antibodies following the intentional inoculation of viruses as part of a clinical experimental study of the effects of these virus infections upon advanced cancer. Included in the study are sera from 20 patients following the inoculation of Smithburn's isolate of West Nile virus, and 50 patients following inoculation of the Egypt 101 isolate of West Nile virus; 20 patients following Ilhéus virus, 10 patients following Newcastle disease virus, and 1 or more patients following inoculation of Bunyamwera, Semliki Forest, Br I, Rabies, and R viruses, and the Egypt 19 and Egypt 21 isolates of West Nile virus. Almost all sera were studied by complement fixation technique, and many were studied by neutralization techniques. Sera from 3 patients were also studied for anti-hemagglutinating antibodies against West Nile virus.*
- *All of the techniques included in this study appeared to be approximately equivalent in their capacity to detect and quantitate antibody formation. In general, these viruses caused production of detectable antibodies in a majority of patients between 3 and 4 weeks after virus inoculation. Thereafter neutralizing antibody titers remained generally stable for the duration of this study, which rarely exceeded 6 months, but complement-fixation antibody titers often fell after 3 to 4 months. Newcastle disease virus differend from the other viruses studied in that the onset of complement-fixing antibody formation was more rapid and the titer of serum antibodies was greater than seen with the other viruses studied. This difference, however, was not observed when the neutralization technique was used.*
- *These data are in agreement with the conclusion that Egypt 101 virus and West Nile virus are antigenically identical, and data from a single patient is compatible with the view that Egypt 21 virus is also identical with West Nile virus. No satisfactory data were available for any conclusion concerning the Egypt 19 virus. There was no major cross-reaction between the West Nile viruses and Ilhéus virus. Antibodies against Japanese encephalitis virus were demonstrated in 2 patients following inoculation of Egypt 101 and Ilhéus virus. These same sera did not react with Western equine encephalitis virus.*
- *There were no data which suggested that any of the patients included in this study had had any previous exposure to West Nile or any antigenically similar virus. A few patients showed suggestive, but not conclusive, evidence of previous contact with antigenic material similar to Ilhéus and Newcastle disease viruses.*
- *Antibody formation occurred following inoculation of virus whether the virus propagated or not. Among patients inoculated with a single virus, there was no apparent correlation between the amount of virus propagation and the magnitude of the antibody response. However, when comparing different viruses, it appeared that those viruses which were more infective for man also stimulated greater antibody production. There were suggestive data to indicate that antibody formation in patients with lymphomatous neoplasms is poorer than in patients with other types of neoplastic disease. There was no apparent relationship between antibody forming ability and various types of cancer other than lymphoma.*

WOMEN AID FIGHT AGAINST CANCER

'Crusaders' to Seek Funds May 3 and 4 in Drive in City and County

Women have played an important part in cancer control, Mrs. Charles S. Chisolm pointed out yesterday in an interview.

Mrs. Chisolm and Mrs. Richard F. Hines are co-chairmen of the "Cancer Crusaders," a group of 500 to 600 women who will call at homes throughout the city and county Monday and Tuesday, May 3 and 4, to distribute educational material and give everyone an opportunity to contribute to the 1954 Cancer Crusade.

"In research, in medicine, in community organization there have been women whose achievements in the field of cancer will go down in history," Mrs. Chisolm said, "Less spectacular, but equally effective has been the work of the teachers, nurses, mothers, wives who joined in the attack.

"The fight against this deadly foe does not necessarily call for extraordinary talent or special skills. Women in any walk of life can save one life if not lives of many, and can help lower the death toll which is so frightening at the present time."

"The fight against this deadly foe does not necessarily call for extraordinary talent or special skills. Women in any walk of life can save one life if not lives of many, and can help lower the death toll which is so frightening at the present time."

Notable Names

One of the notable names in the wide area of cancer research is Mme. Marie Curie, her husband's partner in the discovery of radium, that tremendous weapon in the treatment of cancer. Many other women are working to explore the hidden avenues which might lead to the final answers to cancer. At the Sloan-Kettering Institute there are Dr. Alice E. Moore, who is doing research with the deadly Russian encephalitis virus, and Dr. Lois Murphy, who is doing outstanding work in leukemia, to name but two.

The regular physical examination of seemingly well people as a means toward uncovering unsuspected early cancer or conditions which might be considered

See Page Fourteen, Column Four

Dr. Elise L'Esperance, a pathologist in New York, set up an early prevention or detection clinic as a practical educational device for demonstrating that early cancer can be found in routine examination. Dr. Catherine Macfarlane of Philadelphia, a gynecologist, persuaded a thousand women to come regularly for a pelvic examination over a period of many years. The findings of the study made by Dr. Macfarlane and her associates, Drs. Margaret Sturgis and Faith Fetterman, have been of invaluable assistance in the cancer control program.

The Metropolitan Life Insurance Co. estimates that there has been a decrease of 12.6 per cent of cancer death rates among women during the last decade. That means something like 10,000 lives saved annually when applied to the entire female population of this country. Much of this is due, of course, to the wider availability of the best in medical care, and to improvements in methods of treatment. But all the experts agree that credit must be given to women and their awareness of the cancer problem.

WOMEN AID FIGHT AGAINST CANCER

New Flu Vaccine Is Being Made

WASHINGTON, April 25 — (AP) — The army is working on a new influenza vaccine that will be a great improvement' over the "shots many persons now take in an effort to ward off the flu, it was disclosed today.

The army also said it is developing vaccines for the measles and an acute respiratory disease that is fairly common among new recruits. In another field, it reported work on a portable tooth-drilling machine that would let dentists make "house calls.'

The list of "civilian use' items developed — or being developed — by the army was disclosed in previously-secret testimony just released by the House Military Appropriations subcommittee. The army is spending $370,000,000 a year on research and development.

Meantime, Alice E. Moore of the Sloan-Kettering Institute for Cancer Research told the opening session of the Inter-American Congress of Radiology here that she is searching for a virus that will kill cancer tumors without damaging the health of the patient.

She has succeeded 100 per cent with mice. But experiments on volunteer human patients proved inconclusive. She said the experiments proved the search is worthwhile and may produce results.

Science May Find Virus To Kill Cancer, Not Folks

WASHINGTON (UP) —A scientist held out hope today of finding a virus that will kill cancer but not people.

Another reported success in retarding certain cancers by depriving them of hormones on which their growth depends.

These were highlights of the first session in this country of the fifth Inter-American Congress of Radiology which some 1,500 doctors are attending.

President Eisenhower welcomed the radiologists here. He said that "as the peaceful applications of atomic energy are extended, the responsibilities of radiologists the world over will increase."

Alice E. Moore of the Sloan-Kettering Institute for Cancer Research of New York reported search for a virus which will infect and kill tumors without damaging the health of the patient.

She succeeded 100 per cent—with mice. But experiments with volunteer human patients, past hope of cure by any other means, proved inconclusive.

These human experiments did, however, provide 'encouraging indications that the search is worthwhile and may end ultimately in success.

Dr. D. M. Bergenstal of the University of Illinois Medical School in Chicago reported that surgical removal of hormone - producing glands can stop the growth of some cancers.

Doctor's Notebook

Cancer Treatments Discussed

By GLEN R. SHEPHERD, M. D.

The latest medical applications of X-rays, radium and other radioactive materials to the disgnosis and treatment of disease occupied the Fifth Inter-American Congress on Radiology in Washington, D. C., the week of April 25. Cancer research, diagnosis and treatment had a big place in the scientific discussions by Central and North American doctors.

A Texas radiation specialist reported that hollow needles containing radium implanted in the cancer is still one of the most effective treatments. Even in this age of super-power X-ray machines and powerful radioactive cobalt, Dr. Charles L. Martin of Dallas, Texas, observed that radium needles are highly effective. They can deliver radiation to accessible localized cancer, such as in the cervix, in sufficient quantity to kill it without harming nearby normal tissues of the body.

Another report, by Dr. Raymond R. Lanier, described experiments on mice, indicating that some chemicals made X-ray treatment of cancer more effective. Dr. Lanier is radiologist of the University of Colorado School of Medicine, Denver. His group has used nine different chemical compounds in experiments on mice, tending to show that the chemicals make certain mouse cancer more susceptible to the killing effect of X-rays. He doesn't yet know why. Finding that out might reveal more about the still-hidden basic growth differences between cancer and normal tissues.

Another approach in cancer research was described by Alice E. Moore, of the Sloan-Kettering Institute for Cancer Research. Miss Moore said, "We're trying to find a virus which, when injected into a cancerous tumor, will kill the tumor but leave the patient healthy and unharmed. Working with mice, Miss Moore has used six viruses from Africa and South America and one from Russia that tend to kill cancer without hurting the animal. One tumor that usually kills all the mice was destroyed by the virus and the mice remained well. However, these mice had been bred to resist fatal infection by the virus.

When tried in human beings having cancer who volunteered, the virus treatment did not provide any real benefit. Human experiments were stopped. Miss Moore said, "As usual, only more work wil tell whether this (virus) approach to the problem (of cancer) has any future."

A Philadelphia X-ray specialist, Dr. George E. Pfahler, reported from his 40-year experience that X-ray can almost always cure "strawberry" birthmarks. These are called cavernous hemangiomas by physicians, because they are flat swellings in the skin caused by new-formed blood vessels. However, X-ray has no effect on the "portwine stain" kind of birthmark.

Dr. Pfahler, an internationally known pioneer in the medical use of X-ray, is emeritus director of the Graduate Schoool of Medicine hospital of the University of Pennsylvania. He was honored by a French award at the meeting.

The strawberry birthmarks are best treated early in life, within the first few months, either by radium or X-ray or a combination of these with surgery, according to Dr. Pfahler. He said, "When radiation only (radium or X-ray) is skillfully udseilteeanhrtd mark. skillfully used and the interval between treatments is properly spaced, there is rarely any scarring and commonly no evidence of the location of the former (birthmark) unless it was ulcerated before treatment began."

NEIGHBORING DEATHS AND FUNERALS

Bellevue Native Resident Dies

BELLEVUE, June 8 — Mrs. William A. Crombie, 45, the former Josephine Nims, daughter of Mr. and Mrs. Walter Nims, died Monday in Youngstown.

Mrs. Crombie was born in Bellevue, was graduated from Bellevue High school, Hillsdale College and the Western Reserve Library School. She was a member of Chi Omega Sorority.

She had been associated with libraries of Cleveland Heights High school and Roosevelt Junior High school in Cleveland. She married William Crombie, Nov. 6, 1943, and has been residing in Youngstown. She had also been associated with the Youngstown Public Library, active in Camp Fire Girl work and in the Evangelical Reformed Church.

Survivors in addition to her husband and parents, include a sister, Mrs. Charles Toll of Bellevue and a brother, William, of Cleveland.

Services were Wednesday in Youngstown, followed Thursday at 2 p. m. at the home of her parents on Ridge-rd with burial to be in Strong's Ridge Cemetery, the Rev. Edwin Beers, officiating.

If preferred, contributions may be made to a fund in Mrs. Crombie's memory, to be sent to Dr. Alice E. Moore, head of the Virus Department of Memorial Center, New York City, to be used for cancer research. Mrs. Crombie and Dr. Moore were high school class mates.

The Coming Conquest Of Cancer

"The Coming Conquest of Cancer"
(This is the fifth of six articles describing up-to-date developments in a massive and dramatic research attack on cancer.)

Article V

By JOHN GEIGER
I.N.S. Special Science Writer

NEW YORK ()—Of the several hundred thousand billion cells in the human body, one suddenly becomes malignant or cancerous. Why?

Trying to find the answer to this problem—the core of the cancer puzzle—poses some of the same sort of difficulties as understanding the social problem of juvenile delinquency.

A cancer cell is much like a delinquent. It's young and tough and lawless. In a population of body cells that perform useful functions, like citizens with regular jobs, the cancer cell refuses to grow up, refuses to do any useful work, and—by dividing and growing without control — eventually breaks down law and order.

People are likely to wonder what gets into a boy to make him a delinquent, or to theorize that the cause is something external — a change in his environment. Biologists wonder what gets into a cell to make it cancerous, and try to see if some change in its environment — some alteration in body chemistry—is the real cause.

A few scientists think they have the answer to "what gets into a cell." They think it's a virus.

These infinitely small organisms have been proved to cause many types of cancer in chickens and other fowl. In excitingly important new findings of the last few years, they have been shown to cause leukemia and some gland cancers in mice. But no one can be sure about cancer-viruses in humans.

The possibility of virus-caused cancers is all the more intriguing because new research at New York's Sloan-Kettering Institute suggests strongly that the key to the cancer cell may be locked in its master molecules of nucleic acid, those governing its activities.

And viruses, it seems, are nothing but little shells of protein—filled with nucleic acid. Could there be cancer viruses invading human cells—like little packets of extra nucleic acid — and changing the cell's nucleic acids into a cancerous type?

Or could a virus be found that might invade cancer cells, destroy their nucleic acids—and thus kill the cancer?

At Sloan-Kettering Institute, Dr. Alice E. Moore has been busy training viruses to do just that kind of job against human tumors.

Dr. Moore started with some obscure viruses that were found to attack cancer in mice. They routed the cancers—but they also caused infections that killed the mice, too.

"I wasn't doing anything," she told one visitor unhappily, "That I couldn't have done better with a mousetrap."

But by using the viruses against one tumor after another, over and over again, she managed to increase their appetite for cancer and decrease their appetite for mouse.

When it became possible to grow human cancer cells in test tubes or implanted in laboratory animals, Dr. Moore started training viruses to attack human tumors.

Today she has a number of virus strains that pack a profoundly destructive punch against some kinds of human cancer—in laboratory experiments.

Now, on the research wards at Memorial Center's James Ewing hospital, her viruses are being tried in volunteer patients with hopeless human cancer.

It is much too early to tell what the results will be, or whether the body will treat the friendly viruses like foreign invaders and find some way to block their effects. But win or lose, the knowledge gained will be useful in finding new and perhaps better ways to help future patients.

Other studies are aimed at understanding the effect on the cell of influences that come from other cells or from distant areas of the body, travelling through the blood stream and tissue fluids, or in electrical signals from nerves.

One of the most potent influences is the amount and type of hormones—chemical juices poured into the blood by glands like the adrenal, the pituitary, the thyroid and others.

Hormones are like chemical traffic lights for the life processes within each cell. Some say "go"—and accelerate its growth or activity. Others say "stop" — and slow or check cell functions. Some are like direction signals, steering the cell's activities in a particular pathway.

Could some change in hormone production help turn a normal cell into a cancer cell?

To learn some of the answers, Dr. Thomas F. Gallagher of Memorial Center's Sloan-Kettering Institute has been tracing out the patterns of hormone production in health and in a variety of diseases, including cancer.

The task is extremely difficult. Some hormones accelerate growth, others act like brakes. A rise in the output of one hormone may cause a fall in the production of a second, which in turn affects a third, yet somehow the whole system remains in balance.

The work to date, though still preliminary, already has disclosed strong suggestions that some imbalance of the hormone system exists in patients with cancer.

Even more important, there are hints of hormone abnormalities in patients with pre-cancerous conditions. That could lead to early diagnosis of cancer—while there is still time to treat it effectively.

And that could mean an enormous savings in lives, for quick diagnosis is one of the best weapons now available to stem cancer's tide. American Cancer Society figures show that if all cancers were diagnosed as promptly as possible with present techniques, the number of cures would be doubled.

There have been practical, down-to-earth results of the hormone research. Understanding of the thyroid gland and the fact that its hormone accelerates bodily activity led to temporary cancer control (and many extra months of life) for patients with thyroid tumor. Studies of the pituitary, the body's amazing "boss gland" at the base of the brain, showed that its hormones acted powerfully to promote the growth of breast tumors, one of the greatest cancer threats in women.

This opened a whole new field for investigation. As a result, surgeons today can remove the pituitary gland and bring marked, though temporary, benefit to some patients with breast cancer. The pituitary's output is replaced safely by controlled injections of hormones.

No one can foretell what uses the knowledge gained by fundamental studies of this type will have. It seems sure that it will not be limited to cancer treatment.

For the hormone studies are typical of much research in cancer, and demonstrate the strangest iron of all. The study of cancer—the great killer—is in many ways the study of life itself.

Plymouth Fury on Display

Don't miss seeing the all new 240 horsepower Plymouth Fury now on display at The City Auto Co. here in New Philadelphia. This is the car that recently broke all U. S. Stock Car records of acceleration over a measured mile at Daytona Beach, Florida, a record formerly held by America's largest selling high-priced car. (Official speed 124.01 miles per hour, timed and supervised by NASCAR.) The Fury has proven itself the "Hottest" of the so-called hot cars, don't fail to see this much talked about car today!

THE BUCYRUS (OHIO) TELEGRAPH-FORUM FRIDAY, JANUARY 11,

Cells Similar To Those Of Cancer Given 3 Convicts

NEW YORK (UP) — A medical report has disclosed that abnormal human cells similar to cancer cells have been implanted beneath the skin of three Ohio Penitentiary volunteers.

Emphasizing there was no danger to the volunteers, doctors Alice E. Moore and Chester Southam of the Sloan - Kettering Institute for cancer research reported the experiment to the current New York Academy of Sciences conference on viruses.

They said the implantations in the non-cancerous prisoners were made in conjunction with injections of abnormal cells beneath the skin of cancer patients at the New York Memorial Center for cancer and allied diseases. They also reported injecting cancer cells beneath the skin of the same three Ohio prisoners.

The doctors pointed out that their injections differed from a separate cancer experiment recently performed on 14 Ohio Penitentiary prisoners.

They said their experiment was to answer the question, "What happens to normal cells to cause them to acquire cancer characteristics when removed from their normal environment."

The report stated that the abnormal cells were normal when first taken from a patient and put in a test tube.

The cells were kept in the test tube for many generations. Growth of human cells in test tubes is called tissue culture. Cells can grow and die at a rate of 40 generations per year.

Acquired Abnormalities

The report said that after this growth the cells acquired abnormalities which appeared, under a microscope, similar to cancer cells.

To discover if there was a real similarity, the cells had to be compared with cancer cells, the Moore - Southam report said.

Of the New York implantations, the abnormal cells appeared to grow in only one patient, the report said. They were discovered in the form of a "little lump" at the point of injection. The lump was removed.

The doctors said they found in their test on the three Ohio volunteers that the abnormal cells "had less ability to survive in the normal volunteers than did the known cancer cells." Neither spread.

They also said the appearance and behavior of the abnormal cells after implantation resembled that of cancer cells more than normal cells.

[HT00C3][GDrive]

Studies to determine whether these homologous cancer cells had a similar capacity for propagation in normal healthy human beings were undertaken at the Ohio State Penitentiary in collaboration with Charles Doan and Richard Brooks and with the cooperation of John Porterfield and R. W. Alvis, warden. From a large group of volunteers, 14 were chosen for the initial study. Methods were identical with the aforementioned ones, except that only tissue cultures were used, and all studies were done simultaneously in June 1956.

PRIME MOVERS IN PRISON CANCER EXPERIMENT—Doctors and Ohio state penitentiary officials involved in cancer research using convict volunteers huddle at Columbus, Ohio. Seated, left to right, are Dr. Arthur G. James, Dr. Chester M. Southam, Dr. Alice Moore, and Dr. Earl Albright, acting director of state Mental Hygiene and correction department; Warden A. W. Alvis, and M. C. Koblentz, chief of Ohio State division of Correction. —(AP Wirephoto)

1957 (Feb 25) : Time Magazine - "Medicine: Cancer Volunteers"

http://content.time.com/time/subscriber/article/0,33009,936841,00.html

On wooden benches in the well-guarded recreation hall of the Ohio Penitentiary at Columbus sat 53 convicts—killers in for life, bank robbers, embezzlers, check forgers. Some wore the white jacket and trousers of hospital attendants (duty for which they had volunteered in the prison); others, fresh from work gangs, wore blue dungarees. As a man's name was called he walked upstairs to a room equipped as an emergency surgery, sat down and proffered a bare forearm. Dr. Chester M. Southam of Manhattan's Sloan-Kettering Institute then proceeded to inject live cancer cells.

First, [Dr. Chester Milton Southam (born 1919)] used Novocain to anesthetize an area about three inches across. Into the middle of the area he stuck a tattoo needle that left a blue dot for a reference mark. Out of a vial and into a hypodermic syringe he drew up a cubic centimeter of pink fluid—mostly water, but containing millions of cancer cells from human victims of the disease. The cells had been grown for years in test tubes by **Dr. Alice E. Moore**, Sloan-Kettering tissue-culture specialist, who had carried the cells to Columbus herself —in her handbag.

Dr. Southam inserted the point of the needle alongside the tattoo mark and worked it up the arm for an inch and a half, just under the skin. A push on the plunger injected half the shot (three to five million cells) into the volunteer's arm. Dr. Southam pulled out the needle, turned it around and repeated the process lower down the arm. (Some volunteers received implants of tissue fragments of other human cancer strains, grown in animals and chick embryos.)

Three-Time Repeaters. The prisoners thus injected two weeks ago had been chosen from 150 who volunteered for the tests, which began last spring (TIME, June 4). The aim: to determine whether a healthy individual has an immunity against implanted cancer that will cause his system to reject it just as the healthy body rejects other transplants or grafts from a different individual. In advanced cancer victims this rejection mechanism seems to be greatly diminished or absent. Of the 53 subjects, 27 received implants for the first time, 15 were getting them for the second time, and eleven were three-shot veterans. This last group had received the same type of cancer cells (out of seven types cultivated by Dr. Moore) on the first two occasions, had already shown a high degree of immunity. Now, for their third pair of implants, they received cancer cells of a different type.

The blobs of fluid containing the cancer cells made little bumps on each man's arm. In a matter of hours or days, some of these swelled up and became tender and inflamed; the healthy body's natural defenses were at work and plain to see. In other cases the men felt no appreciable discomfort, and the swelling disappeared without any noticeable inflammatory stage; the body's defenses had worked just as effectively but less conspicuously.

Anti-Cancer Defenses Seen

Ohio Pen Experiments Reviewed By Scientists

CHICAGO (AP)—Scientists report that human volunteers injected with live cancer cells show two kinds of defenses or immunity against cancer, one general and the other specific.

Sixty-five Ohio State Penitentiary inmates in Columbus were the volunteers who allowed cancers to be implanted under their skin. So did 15 hospital patients who already had cancers.

Drs. Hester S. Southam, Alice E. Moore and C. P. Rhoads of the Sloan - Kettering Institute, New York, announced the results to the American Assn. for Cancer Research.

None of the prisoners developed cancers. The implanted cancer cells soon were destroyed by the body's general defenses.

When the same kind of cancer cells were injected a second time, they were destroyed even faster. A specific defense reaction was coming into play.

* * *

THE REPORT said when men were given a different type of cancer cell that was implanted the first time, these cancers also disappeared more quickly than the first implants. By contrast the implanted cancers grew in most of the cancer patients, until removed one to six weeks later. In four patients, the cancers recurred and grew until removed.

The studies proved, said Dr. Southam, that cancer patients lack defense mechanisms which healthy people have. Blood studied showed the cancer patients had less of an unusual protein in the blood, properdin, which is known to play a role in the body's defense mechanisms.

Amounts of properdin varied with ability to reject the cancers.

Dr. Southam said there's not yet any direct evidence that properdin causes destruction of the cancers, but it's a possibility.

Dr. Salk Now Working On Research to Stop Cancer

By PATRICIA McCORMACK
International News
Medical Science Editor

NEW YORK, (INS) —Medical researchers developing ways of building immunity to cancer look for potentially valuable help from Dr. Jonas E. Salk, but they warn

tubes, that could unlock the door to cancer prevention.

Others Trying, Too

He isn't the only scientist pounding on that door. Recently, he made the trip from Pittsburgh to New York to confer with Dr. Alice F. Moore at Sloan-Kettering Institute

found a vaccine which works in mice. It protects the mice against a virus-induced mouse leukemia — blood cancer.

Commenting on Dr. Salk's coming contribution to the cancer field, the National Foundation for Infantile

against expecting any cancer cure when he reveals details of his new studies.

While a pill or medicine that could cure cancer is sorely needed, men of science remind that Dr. Salk's forte is preventive medicine. This is a specialty that deals, among other things, with vaccines — tools that help healthy people build defenses against mysterious killers and cripplers.

As International News Service reported exclusively last week, Dr. Salk, discoverer of the polio vaccine, will tell of his new finds relating to cancer in a medical magazine within several weeks.

It is likely that the report will deal with advances in complex basic research that may lead to an artificial way of helping healthy people build a defense against cancer.

Some in the research field speculate that Dr. Salk may have forged a key, in the complex world of test

MOOSE UNPOPULAR

SOUTH PORTLAND, Me. — (UP) — Students at Maine Vocational-Technical Institute want to change the name of the yearbook, "The Moose Call" and remove the traditional picture of the antlered animal from its cover. They said elimination of the moose symbol would permit the book to represent technical progress rather than imparting "a wee flavor of Paul Bunyanism" to what they consider a growing technical institution.

numbers were, it was in the Mozart works that the group reached the height that leaves an audience deeply satisfied.

Singing with the chorus ,besides the soloists mentioned, were Mary Arbiter, Gwendolyn Ruddell, sopranos; Nancy Barnett, Lois Burcaw, Valentine Green, Beth Lynch, Marjorie Morgan, Jane Nordstrom, Rae Pochapsky, altos; John Bristow, Oscar Dike, tenors; Edwin Cassidy, Earl E. Gordon, Dwight Potter, and Arthur Thompson, baritones.

Assisting were Toni Wray at the organ, Miriam Dailey, Marianne Potter, Edward Simons, violin; Mrs. Potter, Janet Simons, viola; Phyllis Anwar, Pat Barrows, cello; Paul Fried, flute; Dorothy Heier, trumpet; George Koppleman, tympani. Mr. Simons is immediately identified as conductor of the Suburban Symphony and the others are mostly heads of sections for the same musical organization. — Mariruth Campbell.

Outstanding

tradition of Retina quality

na IIIc CAMERA

-in light meter, and a unique sys-components for standard, wide- give you the greatest versatility this price. And there's an extra- hronized shutter with self-timer,

for Cancer Research.

Dr. Moore and other cancer sleuths at Sloan-Kettering have been delving into the question of building immunity to cancer, too.

Already the Sloan-Kettering team has come up with highly significant information on the defense mechanisms of the normal human body to implanted cancers.

Implants of human cancer were made in three groups of healthy inmates at Ohio State penitentiary. The same implants were made in a group of patient-volunteers with far advanced cancer at Memorial Center, the Sloan-Kettering Hospital.

In 13 out of 15 cancer patients, the implants grew until removed six weeks later.

In the first group of healthy volunteers, there was a vigorous local reaction to the cancer implants — something like a king-size reaction to vaccination for smallpox.

By the end of two weeks, the cancer cells were destroyed by this natural reaction.

The second part of the study at the Ohio State penitentiary involved re-inoculation of the first group of normal volunteers. This time, it was found that the cancer cells were destroyed more rapidly than they were the first time.

In the third part of the study, inmate volunteers who already had been implanted with one type of cancer cell received implants of cancer cells of a different type.

As if by magic, something in the body started to work and even these different cancer cells were destroyed.

Something Lacking

This proved an important point: that cancer patients lack something that healthy human beings have. Scientists call it a defense mechanism.

In polio vaccination, the defense is induced by the vaccine — which helps the body muster a power-packed army of antibodies in the blood.

These chemical soldiers lead an all-out attack on polio viruses when come along after vaccination — thus, prevent crippling or killing.

The viruses don't get to first base once the defense mechanism has been triggered by the vaccine.

In the cancer research, blood studies were made to find out just how the reaction came about when the cancers were implanted.

Properdin, a natural body-defense chemical occurring in the blood, was the only factor associated with immunity in which cancer patients were found deficient — when compared with the healthy people in the experiment.

The Sloan-Kettering scientists observed that the search is on for blood serum antibodies — which may have been called to duty to fight the cancer implants the moment they were made in the healthy people.

The Sloan-Kettering group has found antibodies associated with two types of virus-induced cancer in mice.

Virus Theory

Intensive work at Sloan-Kettering has thrown new light on the virus theory of cancer. This is a theory that holds that some human cancers may be caused by a virus.

If the theory can be proved, the next step would be to produce a vaccine — like the polio vaccine — which would help make people immune to cancer viruses.

The Sloan-Kettering people have

paralysis said.

"The paper deals with techniques now being used in Dr. Salk's laboratory which may conceivably contribute to future work on cancer.

"There is no question that his virus laboratory is uniquely equipped to perform the type of research in which it is now engaged."

No New Program

The foundation reminded, however, that in no sense does Dr. Salk's present work represent a new program for the national foundation — even if the work concerns cancer.

The foundation statement noted: "This demonstrates once more the unity of science and the already proven thesis that investigations in one area cannot but contribute knowledge useful to those operating in others.

"The National Foundation has no plans to enter the field of cancer research, as such."

For some years the National Foundation has made no secret about the fact that some of the research projects it supports may add to knowledge of the disease process known as cancer.

Salk Among Scientists Seeking Anti-Cancer Drug

NEW YORK (INS) — Medical researchers trying to find ways of building immunity to cancer look for potentially valuable help from Dr. Jonas E. Salk, but they warn against expecting any cancer cure when he reveals details of his new studies.

Dr. Salk's forte is preventive medicine, a specialty that deals, among other things, with vaccines—tools that help healthy people build defenses against mysterious killers and cripplers.

Dr. Salk, discoverer of the polio vaccine, will tell of his finds relating to cancer in a medical magazine within several weeks.

It is likely that the report will deal with advances in complex basic research that may lead to an artificial way of helping healthy people build a defense against cancer.

Recently, Dr. Salk came from Pittsburgh to New York to confer with Dr. Alice E. Moore at Sloan-Kettering Institute for Cancer Research.

Dr. Moore and others at Sloan-Kettering have been delving into the question of building immunity to cancer, too.

The Sloan-Kettering team has come up with significant information on the defense mechanisms of the normal human body to implanted cancers.

Dr. Salk . . . to make report.

Implants of human cancer were made in three groups of healthy inmates at Ohio State Penitentiary. The same implants were made in a group of patient-volunteers with far advanced cancer at the Sloan-Kettering Hospital.

Reaction Vigorous

In 13 out of 15 cancer patients, the implants grew until removed six weeks later.

In the first group of healthy volunteers, there was a vigorous local reaction to the cancer implants —something like a king-size reaction to vaccination for small-pox.

By the end of two weeks, the implanted cancer cells were destroyed by this natural reaction.

The second part of the study at the Ohio State Penitentiary involved reinoculation of the first group of normal volunteers. This time, it was found that the cancer cells were destroyed more rapidly than they were the first time.

In the third part of the study, inmate volunteers who already had been implanted with one type of cancer cell received implants of cancer cells of a different type.

As if by magic, something in the body started to work and even these different cancer cells were destroyed.

Something Lacking

This proved an important point: That cancer patients lack something that healthy human beings have. Scientists call it a defense mechanism.

In polio vaccination, the defense is induced by the vaccine—which helps the body muster a power-packed army of antibodies in the blood.

These chemical soldiers lead an all-out attack on polio viruses which come along after vaccination—thus, prevent crippling or killing.

The viruses don't get to first base once the defense mechanism has been triggered by the vaccine.

In the cancer research, blood studies were made to find out just how the reaction came about when the cancers were implanted.

Properdin, a natural body-defense chemical occurring in the blood, was the only factor associated with immunity in which cancer patients were found deficient—when compared with the healthy people in the experiment.

The Sloan-Kettering scientists observed that the search is on for blood serum antibodies—which may have been called to duty to fight the cancer implants the moment they were made in the healthy people.

The Sloan-Kettering group has found antibodies associated with two types of virus-induced cancer in mice.

1958 (specific date unknown) - First death of "Powassan Virus" (a 5-yr-old boy in Ontario, Canada)

See : https://en.wikipedia.org/wiki/Powassan_virus

Powassan virus (POWV) is a Flavivirus named after the town of Powassan, Ontario, Canada where it was identified in a 5 year old boy who died from encephalitis in 1958.[2][3] The virus exists in North America and causes long-term neurological sequelae.[4][5][6] The first human case in the United States was found in 1970 in New Jersey and in Russia in 1978.[2] As of 2010, Powassan virus has been noted as the only tick-borne Flavivirus in North America with human pathogenicity.[7]

Powassan virus is also found in the warm climate across Eurasia, where it is part of the tick-borne encephalitis virus-complex.[8] It is found in the Russian Far East (Primorsky Krai) and appears to have been introduced there 70 years ago.[2]

Abstract

Issues associated with newly emerging viruses, their genetic diversity, and viral evolution in modern environments are currently attracting growing attention. In this study, a phylogenetic analysis was performed and the evolution rate was evaluated for such pathogenic flaviviruses endemic to Russia as tick-borne encephalitis virus (TBEV) and Powassan virus (PV). The analysis involved 47 nucleotide sequences of the TBEV genome region encoding protein E and 17 sequences of the PV NS5-encoding region. The nucleotide substitution rate was estimated as 1.4×10^{-4} and 5.4×10^{-5} substitutions per site per year for the E protein-encoding region of the TBEV genome and for the NS5 genome region of PV, respectively. The ratio of non-synonymous to synonymous nucleotide substitutions (dN/dS) in viral sequences was calculated as 0.049 for TBEV and 0.098 for PV. The highest dN/dS values of 0.201–0.220 were found in the subcluster of Russian and Canadian PV strains, and the lowest value of 0.024 was observed in the cluster of Russian and Chinese strains of the Far Eastern TBEV genotype. Evaluation of time intervals between the events of viral evolution showed that the European subtype of TBEV diverged from the common TBEV ancestor approximately 2750 years ago, while the Siberian and Far Eastern subtypes emerged approximately 2250 years ago. **The PV was introduced into its natural foci of the Russian Primorskii krai only approximately 70 years ago; these strains were very close to Canadian PV strains. The pattern of PV evolution in North America was similar to the evolution of the Siberian and Far Eastern TBEV subtypes in Asia.** The moments of divergence between major genetic groups of TBEV and PV coincide with historical periods of climate warming and cooling, suggesting that climate change was a key factor in the evolution of flaviviruses in past millennia

Cancer Antibodies 'Hopeful Research'

Dr. J. G. Makari, Muhlenberg scientist, says there is new evidence that the antibody producing mechanism in persons who have cancer, while differing from the mechanism in normal people, is not paralyzed as has been previously suspected.

He found that Forssman antibodies (a special type of antibody named after its German discoverer) are present in normal individuals in higher degree than in patients with cancer.

Antibodies Raised

When cancer patients were injected with a specific vaccine prepared from carcinoma tissues, the Forssman antibody levels were significantly raised, Dr. Makari said.

Dr. Makari is director of research and is carrying out a cancer research project at Muhlenberg.

At a recent meeting of the New York Academy of Science ne urged a re-evaluation of techniques currently in use in studies in the immunology of cancer. He commented on a paper presented by Dr. Chester M. Southam and Dr. Alice E. Moore of the Sloan-Kettering Institute for Cancer Research.

Drs. Southam and Moore had described differences between responses of cancer patients and normal prison inmates who had volunteered for transplantation of cancer tissue. Such differences in response between normal and cancer cases, said Dr. Makari, are not solely due to cancer antibodies since they may just as easily be due to the presence of Forssman or other antibodies.

Limitations Noted

A major flaw in present techniques of tissue transplantation in the study of cancer, said Dr. Makari, is that they have too many limitations. There is no standard of interpretaion for such results. It is most important, he said, to know the exact composition of tissue culture cells, and to know the many variables which operate in the relationship between the individual and the tumor. Without this knowledge results of techniques cannot be properly interpreted.

Dr. J. G. Makari

The Muhlenberg scientist pointed out that techniques such as the Forssman antibody study, and other similar studies which he also described, overcome difficulties because they provide objective measurements of Forssman or other antibodies at any stage. They may also help to relate the response to its various components. This is a most hopeful area of research which should be vigorously pursued, he said.

Dr. Makari, a resident of South Plainfield, is a specialist in immunology. He became director of research at Muhlenberg Hospital last August. His comments will be published in the Annals of the New York Academy of Science.

2 CHEMICALS AID FIGHT ON CANCER

Role of Guanine, Lactic Enzyme Is Discussed at 7th Annual Meeting

By JOHN HILLABY
© New York Times News Service

LONDON — Two promising new chemicals now being used experimentally in the detection and treatment of cancer were discussed at the opening session of the seventh Cancer Congress here Monday.

The chemicals are guanine, the essential component of the chromosomes that control the growth and heredity of cells, and an enzyme or go-between substance called LD (lactic dehydrogenase) found in the blood and body fluids.

According to Dr. M. Earl Balis of the Sloan-Kettering Cancer Research Institute in New York, the use of guanine opens up a possibility of "a whole new basis for the chemical treatment of cancer."

Dr. Balis contended that if large amounts of guanine were synthesized in such a way that its chemical constitution was slightly altered, as could be done, it would interfere with the cancer cells' function "and retard or stop the disease process" without causing "undue harm" to normal cells. But he admitted that guanine was fairly toxic.

The use of the lactic enzyme LD was discussed by Dr. Alice E. Moore and Dr. Felix Wroblewski, also of the Sloan-Kettering Institute. They said that increased amounts of LD found in the blood spinal fluid or fluids collected in the chest or abdominal cavity were indicative of cancer.

They had, they said, also found that when the growth rate of cancer dicreased as a result of treatment, the rate of LD production decreased similarly. They felt, therefore, that LD measurements provided a sensitive index of the effect of therapy and of the progress of the disease in patients under treatment.

The LD test, they considered, would be particularly valuable in evaluating the effects of chemicals being screened for anti-cancer use. And it would save wastage among laboratory animals that had to be killed to see whether cancer-inhibiting drugs were effective.

Cancer Vaccine Sought

—By Leonard Engel

(Some day you may be able to take your cancer inoculation as easily as you now get immunized against smallpox or flu. This third article by an award-winning medical writer tells of the latest advances made in preventing this dread disease).

★

Nearly sixty years ago, it was noticed that animals ordinarily susceptible to particular types of cancer sometimes became resistant to them after preliminary inoculation with a bit of the cancer tissue. To early investigators, this opened up an exciting possibility — vaccines to immunize against cancer.

★ ★ ★

Their experiments ended in failure and discouragement. The whole idea of anti-cancer vaccines was virtually forgotten.

During the last few years, the question has been reopened. Immunity to cancer and the possibility of developing anti-cancer vaccines are among the most hotly-pursued fields of research in dozens of laboratories. Hope is growing that this may be achieved.

No vaccine against human cancer exists at present. But experts say that a host of new discoveries give solid hope for vaccines to prevent at least some types of cancer in man.

One of the discoveries that provides such hope was made a few years ago by Dr. Ludwik Gross of the Bronx (N.Y.) Veterans Hospital. Dr. Gross showed that mouse leukemia was caused by a virus. Cancer researchers had previously found that viruses were responsible for a number of animal cancers, including mammary cancer in mice. But virus-caused cancers had been believed to be the exception rather than the rule.

Dr. Gross's finding led to experiments that have radically changed this view, now it is known that many, if not most, animal cancers are caused by viruses.

So far, there has been no proof that viruses cause any form of human cancer, although specialists have found some evidence suggesting this. But, as Dr. Wendell Stanley, the University of California's Nobel prize-winning virus researcher, has pointed out: "It's inconceivable for viruses to cause cancer in animals and to have nothing whatever to do with it in man."

The significance of viruses having a part in cancer is simply that we already have vaccines against many viruses. Polio, influenza, yellow fever, smallpox — against which effective vaccines have been developed — are all virus diseases.

The big "if" is whether the human body is capable of making long-lasting defensive antibodies against cancer viruses. If not — as in the case of the common-cold virus — then an anti-cancer vaccine would accomplish little. But a woman scientist, Dr. Charlotte Friend of the Sloan-Kettering Institute in New York, already has produced a vaccine which protects 80 to 90 per cent of susceptible mice against leukemia.

★ ★ ★

Another development that has contributed to the hope of immunization against cancer came last year from the laboratory of Dr. Jonas E. Salk, discoverer of polio vaccine. In the course of research aimed at simplifying the manufacture of polio vaccine, Dr. Salk uncovered unequivocal proof that antibodies can be formed against cancer-like cells grown in test tubes. Thus, monkeys formed antibodies against monkey tissue which had become cancer-like (though not truly cancerous) through long cultivation in the test tube.

The virus studies and Dr. Salk's work have been confined to animals. Just recently, however, two Sloan-Kettering Institute researchers, Drs. Chester M. Southam and Alice E. Moore, performed a daring experiment. Human cancer cells were injected simultaneously under the skins of a group of patients in the terminal stages of cancer, and into a group of prison volunteers.

★ ★ ★

In thirteen of fifteen cancer patients, the cancer implants took and grew until removed, and in four they recurred and had to be removed a second time.

In fourteen volunteers, there were no takes and the implanted cancers were gone within two weeks. Moreover, when cancer cells of the same type were reinoculated into the volunteers at a later date, the implants were even more quickly destroyed than before—as though the first inoculation had immunized the healthy volunteers. Cancer implants of another kind were also rejected with unusual speed by volunteers who had received the original cancer-cell inoculations.

Plainly, immunity has something to do with cancer in man. Cancer researchers say that some day it should be possible to take advantage of it to devise methods of artificial immunization.

Thursday, September 29, 1960 THE NEW MEXICAN 25

Human Cancer Virus Discovered

NEW YORY, (UPI) — The discovery of a human cancer virus was revealed today. It was the second such discovery announced this year in an onrushing strengthening of the theory that many if not all human cancers could be traced to viruses if only science knew how to do the tracing.

However, there is no proof that the newly discovered virus causes cancer either in human beings or in animals. But there is proof that in hamsters it causes a weird deforming of the skull which resembles the human affliction of mongolism.

The virus was found in eight cancers of different types which originated in different places in human bodies. But these cancers were not in human bodies when the virus was found. They were then being "carried" by successive transplantations through a series of laboratory animals.

The discovery was made by Drs. Helene W. Toolan, Gilbert Dalladorf, Marion Barclay, Satish Chandra and Alice E. Moore of the Sloan-Kettering Institute for Cancer Research and reported in the proceedings of the National Academy of Sciences.

The scientists said they are satisfied they are dealing with a virus "associated" with human cancer and not with a random virus of rodents which had been picked up somehow in the repeated transplantations. They are satisfied because —

They had found the viruses in the tissues, (although not in the cancers) of cancer patients but not in people free of cancer. They had found it in the tissues of rats bearing transplanted human cancers but not in normal rats. Nor could they find it in the tissues or cancers of rats carrying spontaneous rat cancers.

No hamster ever has been known to develop the strange disease which develops when the virus is injected into their newly born or their embryos. In that, the virus is unique. No "filterable agent," which is the term applied to a suspected but unproved virus, previously "associated" with human cancer has produced a new disease in laboratory animals.

The scientists made electron microscope picturse of diseased Hamster tissues. These enormous enlargements showed particles which may be the viruses themselves. The work is progressing and they may have more conclusive findings to report. Meanwhile, they said the virus seems to have no resemblance to the viruses known to cause cancers in mice and fowl.

Until last March no virus had ever been identified as a causer of human cancer. Dr. Steven O. Schwartz, of the Hektoen Institute for Medical Research, Chicago, revealed then that he had isolated a virus which causes Leukemia or "blood cancer" in human beings. So far his work has not been independently confirmed by other scientists.

Dr. Sarah E. Stewart, of the National Cancer Institute, Bethesda, Md., has five "filterable agents" which were isolated from five persons with five different kinds of cancer and which in laboratory cultures of human cells, behave as though they were viruses. So far she is unable to say they are human cancer viruses.

Toys Painted Red Outsell All Others

By HARRY MOSKOS
Associated Press Staff Writer

DEMING (AP)—The chances are the next toy you will buy—if you happen to be buying any toys—will be painted red.

And that's because toys painted red will outsell toys painted any other color, and consequently one of the nation's leading toy pro-

ed to the red-colored toy more than he is attracted to a toy of another color.

Even though the company may manufacture many of its toys in red, a variety of other colors is used in the designs of the numerous toys produced. Toys such as cars, trucks, farm animals and tractors, are made at the plant. The color least used in the man-

Virus Aids Researchers In Cancer

By FAYE MARLEY
Science Service Writer

NEW YORK—For the first time a virus found in human cancer has produced a new and characteristic disease in laboratory animals. Researchers are one step closer to solution of the cancer problem with discovery of a virus associated with human cancers.

Dr. Helene W. Toolan of the Sloan-Kettering Institute, New York, has announced that studies she began with injections of hamsters two years ago have been continued and confirmed by associates.

When inoculated into newborn hamsters the virus produces an unusual deformity characterized by small size, flattened foreface or microcephalic domed head, protruding eyes and tongue, absent or abnormal teeth and fragile bone structure.

The virus has been found in all eight of the transplanted human cancers tested but not, so far, in the cancer tissue itself nor in the tissues of normal individuals.

Dr. Toolan in an interview emphasized the fact that although the virus has been found in association with human cancers it is not known yet whether or not it is a factor in the cause of cancer or has any connection with cancer velopment.

"By using hamsters," she said, "we have set up an indicator system—a way of testing."

The virus has an affinity for bone. It produces unique deformities in hamsters when they are inoculated within 48 hours after birth or when the embryos are injected from one to seven days before birth.

The virus has been found in the tissues of rats bearing transplanted human cancers but not in the tissues of normal rodents or in transplantable cancers of rodents. It has not been found in human cancer cells from the same source growing in tissue culture in horse or calf sera. It has been found in tissue culture of spleen cells from infected hamsters grown in human serum, and therefore it is concluded by the investigators that horse and calf sera may neutralize the virus.

Research details appear in Proceedings of the National Academy of Sciences. Associated with Dr. Toolan were Drs. Gilbert Dalldorf, Marion Barclay, Satish Chandra and Alice E. Moore, all of Sloan-Kettering Institute for Cancer Research.

Women Scientists Aid In Battle Against Cancer

By PATRICIA MCCORMACK

NEW YORK (UPI) — Womanpower is helping to establish beachheads in the battle against cancer.

The women scientists work in the laboratories, in the surgical rooms and at the bedside. They help to man the X-ray equipment and to teach other doctors about cancer therapy.

There are so many women engaged in cancer research these days that it is rare not to find a woman or two reporting at any scientific meeting where the battle against cancer is discussed.

Their gains are of such importance that a medical journal, "Medical World News," devotes an entire section of its publication for doctors to the women making news in cancer research.

Among women scientists cited are the following:

—Dr. Sarah Stewart, of the National Cancer Institute in Bethesda, Md. She recently made the first report of a new virus isolated from an infant with a malignant bone disease.

Has Major Findings

—Dr. Thelma Dunn, a research pathologist, has become one of a half-dozen recognized authorities on pathology of cancer in mice. Dr. Dunn also works out of the National Cancer Institute. She is credited with several major findings on the pathogenesis of cancer.

—Dr. Alice Moore, of Sloan-Kettering Institute in New York, has been growing human cancer cells in tissue culture for use in studies in the responses of volunteers, cancer patients and healthy individuals, to implants of such cells.

—Dr. Helen Wallace Toolan, one of Dr. Moore's colleagues in New York, operated a tumor farm that is producing large amounts of tumor tissue for cancer researchers all over the country. Out of this work it is hoped will come a key to help man better understand the ways nature fights cancer.

—Dr. Charlotte Friend, another of the scientists at Sloan-Kettering, discovered a virus which causes leukemia in adult as well as newborn mice. In addition, she brewed a vaccine which is highly effective in protecting mice against development of the disease.

From Cellist To Scientist

—Eleanor MacDonald was well on her way to becoming a professional cellist when science caught her fancy. The professor of viostatistics at the University of Texas M. D. Anderson Hospital and Tumor Institute in Houston has contributed a wealth of data on incidence and distribution of cancer. She still plays the cello, frequently with the university symphony.

—Dr. Mila Pierce, of the University of Chicago, has been devoted to the fight against leukemia. Today, partly because of her efforts, life can be prolonged for some leukemia victims.

—Dr. Ruth Graham, of the Roswell Park Memorial Institute, is known in association with her husband, Dr. John Graham, also a cancer research scientist. At one point they prepared vaccines from the patient's own tumor and have been testing it among terminal cancer cases.

—Dr. Relda Cailleau, associated resident biochemist at the Institute of Cancer Research, Univer-

Report on the VIII International Cancer Congress

Moscow, U.S.S.R., July 22–28, 1962

FOREWORD

Before the VIII International Cancer Congress was held in July, 1962, the Board of Directors of the American Association for Cancer Research recommended that a brief report of some of the highlights presented at these meetings be published in *Cancer Research*. Various scientists planning to attend the meetings were therefore asked to prepare a brief résumé of a particular topic being covered at the Congress.

I would like to take this opportunity to thank each of the following contributors, on behalf of the Board of Directors of the Association and the readers of this journal, for their assistance in preparing this report.

Lauren V. Ackerman, Washington University School of Medicine, St. Louis, Mo.
Joseph H. Burchenal, Sloan-Kettering Institute for Cancer Research, New York, N.Y.
Walter J. Burdette, University of Utah College of Medicine, Salt Lake City, Utah
Sidney J. Cutler, National Cancer Institute, Bethesda, Md.
Emerson Day, Memorial Hospital for Cancer and Allied Diseases, New York, N.Y.
Charlotte Friend, Sloan-Kettering Institute for Cancer Research, New York, N.Y.
William U. Gardner, Yale University School of Medicine, New Haven, Conn.
Alfred Gellhorn, Institute of Cancer Research, Columbia University, New York, N.Y.
J. R. Heller, Memorial Sloan-Kettering Cancer Center, New York, N.Y.
John Higginson, University of Kansas Medical Center, Kansas City, Kansas
W. C. Hueper, National Cancer Institute, Bethesda, Md.

Harold P. Rusch, *Editor*

BIOCHEMISTRY OF CANCER

Elizabeth K. Weisburger

The main Congress lecture on this subject was delivered by V. S. Shapot (Moscow) on behalf of V. A. Engelhardt who, unfortunately, was ill. The lecturer reviewed modern concepts of nucleic acid structure and function in relation to the genetic code and protein synthesis, with particular reference to alterations occurring in the transformation from normal to tumor cells.

The scientific program comprised 75 papers presented in five half-day sessions. The abstracts listed another 62 contributions presented by title. The search for characteristic biochemical differences between tumor cells and normal tissues continues unabated, with the dual aim of understanding the nature of the cancerous transformation and of attacking the neoplastic cells in a selective manner. The abnormalities investigated ranged from simple ions to complex enzyme systems or macromolecules. Other studies dealt with the isolation of inhibiting or promoting factors from tumor tissues. Some reports dealt with the effect of

Downloaded from cancerres.aacrjournals.org on April 10, 2021. © 1963 American Association for Cancer Research.

[HP0064][GDrive]

increased the responsiveness of the mammary tissue to subsequent intrinsic and extrinsic hormones. Strain differences in hormone production or balance were assumed to exist between the C57 and the C3H strains because of differences of the mammary mitotic counts during the estrous cycle and following hormone treatment (Laguchev, U.S.S.R.). The level of pituitary gonadotropins in mice with and without mammary tumors was the same (Demol *et al.*, Belgium). C3H mice with precancerous lesions and mice with mammary cancers showed similar metabolic patterns which could be reversed following ovariectomy or testosterone treatment, which reportedly caused regression of the tumors (Okita, U.S.A.).

The progression of human mammary cancer during pregnancy and the incidence during pregnancy were reported (Holleb *et al.*, U.S.A.). When corrections were made for delay of diagnosis and age of patient, the prognosis seemed little different from that for nonpregnant women similarly treated. Adrenalectomy often resulted in an increase in pituitary FSH in postmenopausal women in whom low values persisted after ovariectomy, a not infrequent observation made on cancerous women (Poulain *et al.*, France). Patients with breast cancer at different stages were given different steroids, and the metabolic derivatives were determined (Schubert *et al.*, East Germany). Although great individual variations occurred, patients with breast cancer showed differences in testosterone metabolism.

The panel discussion was opened by Dr. Kavetsky (U.S.S.R.), and he was followed by A. Lacassagne (France); A. Lipschutz (Chile); R. Larneske (France) substituting for M. Dargent; J. Furth (U.S.A.); and Y. Vasilyev (U.S.S.R.). Three programed participants were absent. Discussions were largely theoretical extrapolations from observations on specific models or on total organisms. The opening speaker discussed endocrine, immunological, and neutral factors in tumor initiation and tumor growth; Lacassagne, the neurohumoral pituitary hypothalamic integrations of normal and some abnormal endocrine functions; Lipschutz, his hypothesis of ovarian tumorigenesis; and Furth, a concise and well diagrammed summary of adrenal regulation or modification of carcinogenesis and of tumor growth. Vasilyev reduced the total organism reaction-response to a cellular level or tissue level involving small areas of cellular damage and cellular response and thus accounting for localization of neoplasia. Hypo- and hyperthyrodism were associated with both the appearance and growth of cancer (Larneske).

VIRUSES IN ONCOLOGY

Charlotte Friend

Among the many papers that were of interest were those concerned with (1) oncogenic properties of some of the "classical" viruses (2) the extension of the host range of tumor-inducing viruses that had been previously considered species-specific, and (3) the pathogenesis of simian virus SV_{40}.

J. J. Trentin (Houston) reported his studies on the induction of tumors in hamsters with a human virus, adeno type 12. R. J. Huebner (Bethesda) confirmed this finding during the discussion following this paper and added that adeno virus type 18 was also oncogenic in hamsters. M. L. Duran-Reynals (New Brunswick) discussed the high incidence of neoplasms, many of which were lymphomas, in cortisone-treated, methylcholanthrene-painted mice of the Swiss strain given inoculations of vaccinia virus. Rare types of neoplasms developed which were not seen among the control mice. N. P. Mazurenko (Moscow) described the properties of a leukemia virus isolated from vaccinia-treated CC57BR mice to which mice of CC57W and C3H strain, as well as rats, were susceptible. Since leukemia was not observed in vaccinia-inoculated mice other than the CC57BR, it is believed that the leukemia virus in question was latent in this strain of mice. Fjelde (Lund, Sweden) found chromosomal alterations in virus-infected (vaccinia or measles) H.Ep. #2 cells cultured in a medium containing D_2O.

Further studies on tumor induction in mammals with Rous chicken sarcoma virus were also presented. C. G. Ahlstrom (Lund, Sweden) reported the induction of tumors in mice, rats, hamsters, guinea pigs, and rabbits with a strain of Rous sarcoma virus that differs from the Mill Hill strain. G. Ya. Svet-Moldavsky (Moscow) and J. Svoboda (Prague) each presented results of studies on Rous-induced sarcoma in rats. Svoboda described very interesting experiments on the growth of the virus in rat cells *in vitro*. In addition, Shapiro (Moscow) found that sheep adenomatosis virus caused cystic disease in mice similar to that caused by Rous sarcoma virus in rats.

Since SV_{40} virus is known to have been a contaminant in polio virus vaccine, there is much concern about its oncogenic potential. Deitchman (Moscow) attempted to isolate an oncogenic virus from human mammary cancer material cultured in monkey kidney monolayer tissue culture. A virus identified as SV_{40}, recovered from both the experimental and control monkey tissue culture, grew in cultures of human tissue and induced re-

Downloaded from cancerres.aacrjournals.org on April 10, 2021. © 1963 American Association for Cancer Research.

[HP0065][GDrive]

ticulum sarcomas in rats. Koprowski (Philadelphia) observed transformation of human adult skin and buccal mucosa tissue-cultured cells infected with simian SV_{40}.

Infectious DNA preparations were obtained by Ito (Nara and Seattle) from wild cottontail rabbit papillomas, from partially purified Shope papilloma virus, and from domestic rabbit papillomas, which had no detectable virus. Using similar procedures, Moloney (Bethesda) isolated infectious RNA from the mouse leukemia virus which bears his name.

In relation to Rous sarcoma virus studies, R. Latarjet (Paris) observed the interference of ultraviolet or x-radiated inactivated virus with active virus. These experiments were conducted in tissue cultures or chick embryos, and the maximum interference was obtained when the radiated virus was added 1 hour before infective virus.

The list of tumor viruses isolated from the chicken, mouse, and rat is steadily increasing (Thurzo, Bratislava; Rauscher, Bethesda; Prigozhina, Moscow; Osamura, Tokyo; Svec, Bratislava), as is the evidence for the vertical transmission of the mouse leukemia viruses (Rudali, Paris; Krischke, Berlin; Mirand, Buffalo).

The vagaries and pitfalls inherent in the methods being used to establish the viral etiology of tumors were discussed by both Zdanov (Moscow) and Timofeyevsky (Moscow).

F. L. Horsfall, Jr. (New York) noted that the cancer-inducing viruses were widespread in the animal kingdom and had properties much like those of the "classical" viruses. He stressed the fact that the special relationship between the host cell genome and the viruses inducing cancer should be given more attention. Under natural conditions, these viruses frequently cause infections that do not result in cancer.

In reviewing the present concepts in viral oncology, L. A. Zilber (Moscow) expressed similar views. He also emphasized that malignancy may be the result of the integration of viral nucleic acid with the cell genome. Should this be the case, infectious virus would no longer be necessary for the further development of tumor and might therefore account, at least in part, for the difficulties encountered in attempts to isolate oncogenic viruses from human neoplasms.

CANCER DETECTION

Emerson Day

One section and one panel of the VIII International Cancer Congress were devoted to cancer detection.

In the section on cancer detection there was no revelation of new cancer screening tests but numerous reports of further experience and some possible improvements of previously reported detection and diagnostic technics. Inadequacies of the interpreting services made it difficult, frequently impossible, to follow details, but throughout the section the theme was clear: "early diagnosis is the most important weapon in the fight against cancer."

Zakharova (Krasnoyarsk, U.S.S.R.) reported successful application of cytology for the differentiation of sarcoma and carcinoma with specimens obtained by aspiration and by tumor imprint methods. Oakland (Birmingham, Great Britain) reported an accuracy of over 80 per cent in the cytologic study of colonic washings with particular success for the terminal portion of the sigmoid colon. Cook (St. Louis) reviewed the usefulness of silicone foam polymer casts of the lower gastrointestinal tract for the detection of small tumors by the imprints they form; the extruded mold also provides a sample of locally exfoliated cells for cytologic study. A balloon modification of this technic has given encouraging results in the esophagus and upper stomach.

Masuda (Kyoto, Japan) reported extensive experience with the Japanese gastro-camera, which is easily swallowed and gives a series of color photographs of the mucosa; with increasing experience it is possible to differentiate benign from early malignant lesions. Krasnov (Alma-Ata, U.S.S.R.) reported use of balloon electrodes to record electropotentials of the upper gastrointestinal tract whereby "bioelectric silence zones" can be used to determine the extent of tumor and to differentiate malignant from nonmalignant lesions.

Among other diagnostic procedures, Balter (Soroki, U.S.S.R.) reported use of noncontrast x-ray mammography with 95 per cent reliability in 267 patients when there was a histologic diagnosis. An 8-year experience with radioisotope technics in the study of over 1,000 patients with proved or suspected brain tumors was reported favorably by Shamov (Leningrad). Hysterography was reported by Yurukov (Sofia), on the basis of a 9-year study, as having a high degree of reliability in diagnostic studies for uterine cancer with essentially no contra-indications as long as the instillation is undertaken slowly under x-ray guidance. Baccaglini (Padua, Italy) reported that phase-contrast studies of tissue samples taken at operation had proved to be more rapid and more reliable than fluorescent technics in determining extent of tumor and required surgery at time of operation.

EX-BELLEVUEAN SPEAKS

BELLEVUE, O.—Child Conservation Study Club of the United Church of Christ was addressed Monday by Dr. Alice Moore, a former Bellevuean now research head of the Virus laboratory at Sloane Kettering Institute, New York City. Dr. Moore was introduced by her mother, Mrs. John Moore, a charter member of the local club. Dr. Moore showed pictures of Russia and Iron Curtain countries of Europe, which she visited last summer following sessions of the World Cancer Congress in Moscow.

1963 (May 12-14) - Dr. Alice E. Moore has multiple roles with the "Fifth Meeting of the Human Cancer Virus Task Force" ... which later becomes the SVCP (Special Virus Cancer Program)

See (2004) "An Administrative History of the National Cancer Institute's Viruses and Cancer Programs, 1950-1972 ", by By Carl G. Baker, M.D. / Source of PDF at [HB006C][GDrive]

The Fifth Meeting of the Human Cancer Virus Task Force

At this meeting held at the Airlie House Conference Center on May 12-14, 1963, twenty-six investigators from Task Force participating laboratories presented current work underway in their laboratories. The arrangement provided many opportunities for informal interchange of ideas, information, and future possibilities. The informality and common purpose encouraged the reporting of up-to-date activities well before publication. This meeting initiated a series of annual meetings attended by leading investigators in the cancer-viruses field and their staffs. The annual congregations continued for more than a decade and are continued still under the tutelage of Bob Gallo. At the close of the first meeting five informal subcommittees of the Task Force composed of members from the participating laboratories were formed:

- **PPLO Subcommittee**
  - J. Horoszewicz (Chairman) RPMI
  - E. de Harven SKI
  - ➡️ **A. Moore SKI**
  - R. Manaker LVO-NCI
  - N. Somerson LID-NIAID
  - K. Smith Baylor U.
  - R. Holdenried VRRB-NCI
  - R. Meyer VRRB-NCI
- **Laboratory Animals Subcommittee**
  - E Mirand (Chairman) RPMI
  - F. Rapp Baylor U.
  - [**Dr. Charlotte Friend (born 1921)**] SKI
  - W. Rowe LID-NIAID
  - P. Sarma LID-NIAID
  - J. Moloney LVO-NCI
  - R. Holdenried VRRB-NCI
  - L. Murphy VRRB-NCI
- **Primates Subcommittee**
  - J. Melnick (Chairman) Baylor U.

Transplanting Cancer To Another Body Tough Job

By EARL UBELL
Herald Tribune News Service

NEW YORK — Would you take an injection of a million cancer cells in your arm? The thought of it will send shudders through any normal person unfamiliar with modern biology. He thinks: what if those cells took hold and grew into a full, deadly cancer?

Yet almost every cancer biologist knows that one of the hardest biological tricks to pull is to transplant a cancer from one animal to another. And nobody has ever done it by transplanting a cancer from one human being to another.

At the same time such experiments on human beings — injecting cancer cells — have the possibility of an enormous pay-off: a vaccine against cancer or a technique for helping the body get rid of a cancer.

Given this information, one wonders why cancer injection tests on patients at the Jewish Chronic Disease Hospital in Brooklyn raised such a brouhaha when it was recently made public. It is entirely possible that the doctors involved made a tactical error in failing to describe fully to the patients or to their families every step of the experiment. But even if they omitted the deadly word: cancer, have they hurt their volunteering patients? The answer is no.

The experiments in this field began with a question: is there something wrong with the cancer patient's defenses against cancer? The possibility had been raised by a whole series of tests on animals.

Researchers found that it was exceedingly difficult to transfer a cancer from one animal to another. They could make the transplant only in closely related animals of the species and strain — in fact, almost always only in pure-bred animals who were alike genetically as twins.

If the researchers injected certain chemicals first the transplants had a better chance of "taking," otherwise the body mobilized its defenses — chemicals and blood cells — and choked off the transplant.

This made the researchers wonder if in the cancer patient the natural defenses also had broken down. So Dr. Chester Southam and Dr. Alice Moore, of Sloan-Kettering Institute for Cancer Research, began in 1956 to track down those defenses.

They had to find out how normal, healthy people react to cancer cells injected under the skin. All the evidence pointed to the high probability that the healthy person would soon choke off the transplant. Nevertheless, it was cancer they were playing with and not much human work had been done.

Dr. Southam induced 96 healthy men incarcerated at Ohio State Penitentiary at Columbus to volunteer with the full knowledge of what he was going to slip under their skin.

Since that time more than 300 prisoners have volunteered for the tests. In not one of them did the cancer cells become a full blown cancer. Most of the cells died within days, in some volunteers it took a couple of weeks. When the same volunteers received additional injections, their bodies killed off the cells even more quickly.

So not only did Dr. Southam and his associates demonstrate that the normal individual can defend himself against a foreign cancer, but in some instances the defenses could be improved. Furthermore, the procedure carried no danger greater that that of a blood transfusion.

But what about cancer patients? At about the same time Dr. Southam secured volunteers among the dying cancer victims at Memorial Hospital which is associated with Sloan-Kettering. Most of them were not only willing, but eager to help saying: "I know it is too late for me. Maybe this will help somebody else."

The cancer cells lived longer in the cancer victims than in the healthy volunteers. In one instance, a patient with an advanced cancer of his own died with his disease six months after receiving the injection of cancer cells. The injected cells were still alive.

These tests indicated that in the cancer patient the defenses were down or at least weak. Similar results followed in almost 300 cancer patients. But none of the injected cells turned into full-blown cancers on their own.

Because of the results — namely that the injected cells never took over — Dr. Southam and his associates told their volunteers less about the nature of the injections to save them any possible anguish. Each patient was told that he was volunteering for an experiment, not treatment.

Still, a basic biological issue remained open. Was the weakened defense a result of cancer or did it come simply from being very sick and debilitated? Wasn't it possible that if somebody suffered a severe heart attack, say, and lost 60 pounds and was very weak, that the defenses against cancer might also be low?

It was this question which Dr. Southam tried to answer with the experiments carried out by the doctors at the Jewish Chronic Disease Hospital. The results are in: these patients had the same response to the cancer cel as the healthy volunteers: the cells died in a few days to a week at the most. The anti-cancer defenses were strong.

Here then we have a wide possibility: if there is such a biological mechanism as a defense against cancer then it may be possible to stimulate it either before cancer strikes or perhaps even later when the cancer has taken hold.

This is the question which Dr. Southam is trying to pursue. It would be a shame if a squabble over who-told-what-to-whom should destroy a thrilling lead in cancer research.

ONLY HUMAN

By Sidney Fields

Animal Blood for Serum

Up at Otisville, N.Y., 90 miles from town, the city runs its own animal breeding farm. The animals help supply the Health Department's labs with serums, antiserums and antitoxins. The labs use them to detect a host of common and uncommon diseases.

The farm is run by handsome, lively Dr. Lisbeth Kraft, who says it's probably the only farm of its kind in the world. Started by the city in 1910 to make diphtheria serum, it is now a complex of 25 buildings on 166 pleasant acres and has a steady animal population of 1,600 mice, monkeys, goats, hamsters, chickens, ducks, geese, guinea pigs, rabbits, rats, sheep, cows, mules and horses.

"The horses are mostly retired city mounts," Dr. Kraft said during a visit to the farm. "It's a nice deal for them. We give them a country life in happy retirement and they give us blood for serum."

Dr. Kraft—and friend

Dr. Kraft holds a degree in veterinary medicine from Cornell and spent 14 years in researching diseases of lab animals. She discovered two viruses that afflict infant mice and, with Dr. Alice Moore of Sloan-Kettering Institute, described a third virus that attacks mice. Why is this important?

"Research people and those who raise mice for labs think they're important. For instance, by keeping some mice germ-free and giving others germs, we may be able to discover why one person gets typhoid fever and another just becomes a carrier and never gets it."

Staff of 50 at Farm

She came to the Otisville farm three years ago as the Health Department's assistant director of Laboratories. There's a staff of 50 at the place, animal caretakers, lab technicians, veterinarians, bacteriologists, biochemists.

They prepare tissue cultures from the animals which are eventually used to diagnose things such as polio, respiratory diseases, encaphalitis and intestinal afflictions.

They make antiserums needed to combat other diseases, to type Rh blood and to test for syphilis.

And they make vast quantities of serums and take whole blood from sheep, goats, horses, guinea pigs and chickens to detect diseases such as whooping cough, rheumatic fever, meningitis, diphtheria, influenza, mumps.

"As infrequent as some of these things now are in the city and its environs," Dr. Kraft said, "doctors have to keep tabs on them constantly to prevent epidemics."

All the serums, antiserums, antitoxins and blood are sent to the Health Department offices and labs in the city, where they are used; eventually they get to health stations and clinics throughout the city when needed.

Directed by Dr. Schaeffer

Besides its regular work, the farm undertook three years ago to be part of a center for adenoviruses. An adenovirus infects human beings with respiratory diseases. A few of the adenoviruses are used to produce tumors in mice.

The center is directed by Dr. Morris Schaeffer, who runs all the labs for the Health Department, and by Dr. John P. Fox, an epidemic expert. The materials necessary to diagnose the respiratory diseases in human beings and the tumors in mice are made at the Otisville farm.

"This is one of a number of such efforts around the country," Dr. Kraft said. "There are centers for other viruses because no one place has enough people, space, or time to study all of them."

Big, Old, House

Otisville is a very busy place indeed.

"Sometimes," Dr. Kraft sighed, "I don't know whether I run the farm or the farm runs me."

She lives in a big, old, white house on the grounds with her mother, her dog and her cat. Mention the word "loneliness" and she tells you calmly, "Loneliness is for people who haven't enough to do." Oh, there's time for the countryside, for her piano. But mostly it's her work.

"Because my work is play," she said. "The compensations are many: There's drama and excitement in it. And my bosses are 90 miles away."

At Your Service

By MARGARET BROWNE

Semi-annual collection of great European fashions for children at one store offers the cream of the crop from Spain, France, Italy, England, Denmark and Germany. There are starched frocks from Spain, little bikinis from France, printed terry cloth beach things from England and delicately beautiful baby clothes from Belgium. Fabrics include fine cotton lawns, satin-striped ginghams, fine cotton gabardines and twills, percales, and the famous Italian knits in cotton and twill. An overblouse of red cotton twill from Spain is appliqued with navy blue and white checkered fish and teamed with a smartly, pleated skirt of white cotton twill for a really spanking fresh look . . . Little play-dress of blue dotted white cotton percale has a charming frilled collar all hand-smocked and piped with blue. The whole thing is lined with cotton.

Send a stamped, self-addressed envelope to MARGARET BROWNE, THE NEWS, 220 E 42d St., New York, N. Y. 10017, for information on the above-mentioned items.

1964 (Dec 04) - NYTimes : "Mouse leukemia fought by a virus ..."

December 4, 1964, Page 47 / Source : [HN01K3][GDrive]

The discovery of a virus that appears capable of knocking out leukemia in mice without seriously harming the animals has been reported b/ a team of Long Island scientists.

The virus seems to he different from any other found in mice, a scientist said yesterday, and may represent a new category of these infectious agents.

Its unusual properties may account for the strange circumstances under which the virus was found by scientists at the Waldemar Research Foundation of Woodbury, L. I.

Those circumstances, in fact, may point the way to the development, of techniques for finding other viruses of similar characteristics — perhaps viruses that could be used safely against cancer In humans—the scientists said.

The report was presented yesterday to newsmen by Dr. Norman Molomut, director of Waldemar, at the New York Hilton Hotel. His colleagues, Dr. Morton Padnos and Dr. Leo Gross, were also present. Their findings will be published in Nature, the British scientific journal, in its issue of Dec. 5, and in a forthcoming number of The Journal of the National Cancer Institute.

The possibility of using viruses against cancer is not a new idea. The ability of viruses to kill cells and their preference for infecting only certain kinds led to speculation many years ago over whether viruses could be found that would attack cancer cells preferentially.

Work in 1920's Recalled

Work along this line began with the use of quite common viruses injected directly into animal cancers, and some measure of success was reported.

In the early nineteen - twenties for example, scientists at the Institut Pasteur in Paris reported making animal cancers shrink with injections of vaccinia, the virus in smallpox vaccine.

Early work on anticancer viruses in this country was done at the Sloan-Kettering Institute by Dr. Alice Moore.

In a telephone interview yesterday, Dr. Moore recalled trying several types of. viruses against several kinds of animal cancers. She killed some of the tumors that way but left others unaffected. Moreover, she said, it was never determined how to predict which virus would work on which cancer.

In the early nineteen-fifties she and Dr. Chester Southam began using viruses against tumors in human terminal cancer patients.

They found that the virus—Egypt 101, a strain of West Nile virus — sometimes was more destructive of cancer cells than of normal- ones or persisted! longer in tumors than in! healthy tissue.

The trouble was, Dr. Moore said, that the viruses did not "seem to be able to knock out" the very last cancer cell. Therefore, the tumors grew back when the viruses were depleted from the body. Additional injections of virus did not work because the first one acted as a vaccination, rendering the patient immune to further exposures to the virus.

New Findings Outlined

Nor would it have been practical to give an overwhelmingly large initial dose of the virushoping - in this way to kill all the cancer cells—because this would present the risk of death from viral infection.

In contrast, the virus that the Waldemar scientists have found seems to be ^effective against mouse leukemia —a blood cancer—at doses much lower than those that would cause overwhelming infection.

Moreover, all mice that received the virus are alive and free of cancer more than 150 days after receiving transplants of leukemia tissue, the scientists said. Normally, mice die of transplanted leukemias in a couple of weeks.

The virus was discovered in tissue cultures of a mouse tumor that would not grow when implanted into mice, Dr. Molomut said. The tumor was an Ehrlich ascites carcinoma, a cancer that grows in the abdominal fluid of mice.

In an effort to find out what was preventing the transplanted tumors from “taking” the scientists fractionated the cancer tissue and injected each fraction into mice, Dr. Molomut said.

Blood Stream Studied

Because their research focused primarily on tumor immunity, they, looked for reactions to the injections in the blood stream. One cell - free fraction of the tumor tissue culture caused a marked depletion in white blood cells, called lymphocytes, Dr. Molomut said.

Inasmuch as leukemia is characterized by an overabundance of white blood cells, he explained, that cell - free fraction was injected into mice that had received transplants of leukemia tissue. When growth of the leukemia tissue was inhibited, Dr. Molomut said, the fraction was studied further and found to contain a virus.

Dr. Molomut said he believed other viruses probably existed and should be sought in human material.

Meanwhile, the Waldemar virus is being more thoroughly studied by Dr. Molomut and his colleagues, Dr. John B. Nelson at the Rockefeller Institute and Dr. John Maloney of the National Institutes of Health in Bethesda, Md.

Science Women Plan Bennington Event

BENNINGTON, Vt. — Putnam Memorial Hospital Institute for Medical Research will sponsor a medical symposium by noted women of science May 21 and 22, it is announced by Dr. Helene W. Toolan, director of the institute. Dr. Robert J. Slater, dean of the University of Vermont Medical College, will be program moderator.

Among the women scientists to attend the symposium will be Dr. Cecelie Leuchtenberger, professor, department of cytochemistry, Swiss Institute for Experimental Cancer Research of Lausanne, Switzerland; Dr. Charlotte Friend, associate member, Sloan-Kettering Institute for Cancer Research, New York; Dr. Bernice E. Eddy, chief, section on experimental virology, division of biologics standards, National Institutes of Health, Bethesda, Md.; Dr. Marguerite Sykes, assistant attending physician in the chemotherapy service, James Ewing Hospital and in department of medicine, Memorial Hospital, New York; Dr. Alice E. Moore, associate member Sloan-Kettering Institute for Cancer Research, New York,; and Dr. Ruth Sager, department of zoology, Columbia University, New York.

Two-Day Science Seminar Here on Cancer Research

Scientific and medical personnel from across the Eastern United States, Canada and even England will be among those attending a special science seminar sponsored here Friday and Saturday by the Putnam Memorial Hospital Institute for Medical Research.

The symposium, to deal with latest developments in cancer research and related fields, will feature seven "Distinguished Women of Science." Lectures given by the seven women will all be presented at the auditorium at St. Joseph College in Old Bennington.

While understanding of the seven lectures generally presupposes some medical or scientific background, the symposium is also open to interested laymen. Persons who would like to attend should contact the research institute's director, Dr. Helen W. Toolan, regarding registration.

The first four lectures, to be held Friday afternoon, will all relate to "the hot subject of whether viruses can cause human cancer;" according to Dr. Toolan. The speakers and their subjects during the Friday afternoon session are:

Dr. Cecelle Leuchtenberger; professor, Department of Cytochemistry, Swiss Institute for Experimental Cancer Research, Lausanne, Switzerland; "The Significance of the Intracellular Nucleic Acid Metabolism for Virus Infections and Tumors;" at 1 p.m.

Dr. Charlotte Friend, associate member, Sloan Kettering Institute for Cancer Research, New York City; "Recent Studies on a Virus-Induced Murine Leukemia;" at 2 p.m.

Dr. Bernice E. Eddy, chief, Section on Experimental Virology, Division of Biologics Standards, National Institute of Health, Bethesda, Md.; "Studies on the Oncogenic Viruses: Simian Virus — 40 and Human Adenovirus Type 12;" at 3 p.m.

Dr. Sarah E. Stewart, Division of Viral Oncology, National Cancer Institute, National Institute of Health, Bethesda; "Viruses in Cultured Human Lymphoma Cells;" at 4 p.m.

Three more lectures on less closely related fields will be presented Saturday morning. The speakers and their subjects for this session are:

Dr. Marguerite Sykes, assistant attending physician in the Chemotherapy Service, James Ewing Hospital and in the Department of Medicine, Memorial Hospital, New York City; "Clinical Aspects of Cancer Chemotherapy—A Review;" at 9 a.m.

Dr. Alice E. Moore, associate member, Sloan Kettering Institute; "Emperipolesis: Cell - Through - Cell Transit (a movie)" at 10 a.m.

Dr. Ruth Sager, Department of Zoology, Columbia University, New York City; "Nonchromosomal Heredity;" at 11 a.m.

Each hour's session will consist of a 45-minute lecture with a 15-minute question and answer period. Moderator for the symposium will be Dr. Robert J. Slater, dean of the University of Vermont Medical College.

To complete the two-day session, there will be an open house Saturday afternoon from 1 to 3:30 at the Putnam Institute for Medical Research.

Special Virus Leukemia Program -- End of F. Y. 1965

With the end of Fiscal Year 1965 on June 30, 1965, the Science/Management Group sent on August 3 a summarizing memorandum to members of the working groups. Part of this memorandum follows:

In a span of approximately eight months, the chairmen and working group members have developed detailed program plans for their respective areas, and accomplished the difficult task of developing and reviewing numerous research projects which have been officially executed as 48 research contracts. As of the close of the books for fiscal year 1965, $9,932,000 of the $10,000,000 appropriated has been obligated. It is realized that the fast pace of activities required for this accomplishment has left insufficient time for working group members to acquire a detailed knowledge of the individual contracts developed by working groups other than their own.

Attachment I presents key information on each contract developed and implemented during the year. The contracts are listed by working groups to stay within the program structure of fiscal year 1965. It is hoped that this material will provide you with the necessary background information so that the tasks of developing new projects and modifying existing program elements can be performed against a complete knowledge of the total program.

There will be some attempt to establish a better distribution of contract renewal dates by fiscal year quarters so as to reduce the heavy concentration of contract reviews that usually takes place in the third and fourth quarters. If this can be practically accomplished, you will receive an updated list of contracts reflecting any changes in renewal date.

Attachment II presents a summary breakdown of the number of contracts and the amount of funds obligated by the working groups.

Attachment III is a summary report of both the scientific and administrative activities accomplished in the program for the time period September 1964 through June 1965.

Attachment IV presents a reiteration and discussion of the main underlying program assumption.

It became increasingly apparent during the year that areas of overlap between the functions of the working groups on Developmental Research, Production, and Resources and Logistics were resulting in an uneven degree of participation by these groups in the program and in confusion as to which group had the responsibility of soliciting, developing, reviewing, and requisite monitoring of various production type contracts. After several discussions with the chairmen of these groups, it seems desirable to effect the following changes:

Eliminate the working group of Production at this time and re-align its membership with the Developmental Research and Resources and Logistics group as follows:

- ORIGINAL MEMBERSHIP OF PRODUCTION GROUP ----> NEW ALIGNMENT
- Dr. Robert Manaker, NCI (Chairman) ----> Developmental Research
- Dr. Robert Couch, NIAID ----> Resources & Logistics
- Dr. Paul Gerber, DBS ----> Developmental Research
- Dr. Leonard Hayflick, Wistar Institute ----> Testing & Monitoring
- **Dr. Alice Moore, Sloan-Kettering Inst. ----> Developmental Research**
- Dr. Timothy O'Conner, NCI ----> Developmental Research
- Dr. Alan Rabson, NCI ----> Developmental Research

With the end of the activities of the Special Virus Leukemia Program within fiscal year 1965, Dr. Ray Bryan has resigned as Chairman of the Developmental Research Working Group, in order to devote full time to his heavy responsibilities as a senior program leader in the NCI. Dr. Robert Manaker has agreed to succeed Dr. Bryan as Chairman of the Developmental Research Working Group -- effective July 1, 1965. Dr. A.J. Dalton has agreed to continue as Vice-Chairman.

Intensive study is offered in the fields of enzymology, bio-organic chemistry, molecular biology, and metabolism of proteins and nucleic acids.

Undergraduate prerequisites include courses in inorganic chemistry, qualitative chemistry, quantitative chemistry, physical chemitry, physics (mechanics, electricity and magnetism, and sound, heat, light), biochemistry, and mathematics (through calculus). If any of these requirements have not been fulfilled at the undergraduate level, they must be taken at the onset of graduate study.

Students electing biochemistry as a minor subject are expected to complete the regular medical course in biochemistry, or its equivalent, as a minimum requirement.

IN THE COUNTY JUDGE'S COURT IN AND FOR BROWARD COUNTY, FLORIDA
PROBATE NO. 24023
IN RE: ESTATE OF
MAURICE CONLEY HENDERSHOTT
a/k/a MAURICE C. HENDERSHOTT
Deceased.

NOTICE TO CREDITORS AND CLAIMANTS

You and each of you are hereby notified and required to present any claim and demands which you, or either of you, may have against the Estate of MAURICE CONLEY HENDERSHOTT, a/k/a MAURICE C. HENDERSHOTT, deceased, late of the County of Wayne, State of Michigan, to the County Judges of Broward County, Florida, at their office in the Court House, Fort Lauderdale, Florida, within six (6) calendar months from the date of the first publication of this notice. Each claim or demand must be in writing and must state the place of residence and post office address of the claimant, and must be sworn to by the claimant, his agent, or his attorney, or the same will become void according to law. Such creditor or claimant must at the time of the filing of the same deliver a copy of such claim to said County Judges in compliance with Chapter 61-394, Laws of Florida for 1961.

This 21st day of July, 1966.

Evidence for Oncogenic Properties of Heteroploid Cell Lines—Discussion

ALICE E. MOORE, *Sloan-Kettering Institute for Cancer Research, New York, New York 10021*

IT seems appropriate to a conference discussing the use of vaccines made in tissue culture to ask the question: What happens if an individual is inoculated with living human cells—either normal, transformed, or cancerous?

I will discuss the work done a number of years ago by Dr. Chester Southam and myself which involved the inoculation of such cells into two groups of human adult volunteers—patients with advanced cancer at James Ewing and Memorial Hospitals and normal adult males at the Ohio Penitentiary. Only the data from our first studies are presented here, since the same results were obtained in later studies which involved much larger numbers of volunteers.

Freshly grown tissue-cultured cells were trypsinized, washed, and counted, and as soon as possible thereafter, 1–4 million cells were inoculated subcutaneously into the forearms of the volunteers. The inoculation sites were examined daily for any local reaction and for the appearance of nodules.

In the early studies, all nodules were completely excised. In later studies, some nodules were allowed to regress. The results are shown in table 1 which gives the cell lines inoculated and the two groups of volunteers.

When human embryonic fibroblasts were inoculated, no tumors were produced in the 3 cancer patients or in the normal humans. We have many more individuals who received these cells and we have never seen tumors in any of them.

The transformed lines (now, I believe, being called converted)—were originally normal cells which through cultivation developed biologic or morphologic characteristics which made us consider them no longer normal—when inoculated into the cancer patients, specimens from 8 of the 11 sites biopsied showed living cells. In one biopsy site, a nodule recurred. These same cells given to the normal human volunteers produced no nodules.

Digitized by Google

[HG00C8][GDrive]

TABLE 1.—Tissue culture cell lines inoculated into human volunteers*

Recipients	Cells inoculated				
	HEF†	Transformed		Cancer	
		Positive biopsy specimens	Recurrences	Positive biopsy specimens	Recurrences
Cancer patients...	0/3	8/11	1	11/12	4
Normal patients...	0/3	0/3	—	4/15	0

*Positive biopsy specimens/inoculated sites.
†Human embryonic fibroblasts.

A great difference between the two groups of volunteers was shown when the human epidermoid cancers were inoculated. In the cancer patients, there was very little, if any, local reaction. But 7–10 days later, a definite palpable nodule appeared. It was excised and showed growing cells in 11 of the 12 biopsy specimens. Also, at the biopsy site, there were 4 recurrences. In the later studies where the nodules were not removed, the HEp–3, our most tumorigenic cell line, produced nodules which persisted until the patient died of his own cancer. In one instance, we found a metastatic nodule in the axilla at autopsy 8 weeks post inoculation. In other words, some cancer cells inoculated into patients with far-advanced cancer were capable of sustained growth.

The picture was quite different in the normal humans. At the inoculation site, there was a definite reaction consisting of swelling, redness, and in some instances tenderness lasting sometimes as long as 2 weeks. Nodules also appeared, although they were difficult to define due to the local reaction. However, in 4 of the 15 biopsies performed, viable tumor cells were found. There were no recurrences. Under ordinary circumstances, the tumors regressed spontaneously within 2 weeks. Even when the individuals received the most tumorigenic line, the HEp–3, the nodules disappeared in 4–6 weeks.

I mention this rather ancient history to refresh your memory and also to point out that there are two things governing whether cells will produce tumors in individuals. One is the kind of cells inoculated and the other is the recipient. In other words, if a normal human is inoculated with cancer cells, we wouldn't expect him to develop a tumor, whereas in a patient with far-advanced cancer, a growing tumor could possibly be produced which would persist. Even with the most tumorigenic cell line, inoculated into the most susceptible patients, 1 million cells were necessary to produce a nodule. In other words, cancer cells grown under ordinary tissue culture conditions are probably less dangerous in a vaccine than the unseen microorganism, either bacterial or viral, that they may carry.

[HG00C9][GDrive]

GENERAL DISCUSSION

Dr. J. Furth: Dr. Moore introduced a chapter which hasn't been touched on yet, but which is so vital in oncology—the immunological surveillance, which operates not only versus homologous but also versus autologous cancer cells. A transformed neoplastic cell may grow *in vitro*, but may not be re-graftable in the host of origin if it is modified immunologically.

Dr. Orr (NIH): Dr. Sanford, in view of your evidence incriminating horse serum and cell conversion, what has been the experience with growing the WI–38 cells in horse serum? Or can anyone else answer this question?

Dr. K. Sanford: I don't know of any work on growth of WI–38 cells in horse serum. However, a neoplastic conversion in human cells would be difficult to detect with any reliability.

Dr. L. Hayflick: Most cultures of WI–38 that we and others have grown in the past 5 or 6 years have all been grown in calf serum. On the one or two occasions that we tried horse serum, we did not see any transformation of the type described here.

Dr. Sanford: Several lines in our laboratory have been grown on horse serum, fetal calf serum, or calf serum. With cells derived from a common pool, the ones on calf serum underwent neoplastic change almost as readily as those on the horse serum medium. Those grown on fetal calf serum showed the delay.

Dr. B. A. Rubin: Dr. Sanford, we, of course, in growing lots of diploid cells are very interested in your work.

Have you heat-inactivated any of these sera and, if so, what happens? You say you are fractionating these sera, but there is a very simple question that has come up, for instance, in regard to fetal calf serum about whether there are labile metabolites or something like that which might be affected. We have heard a lot about the possibility of viruses in sera in the last couple of days. So this is an important question. What is the effect of heating?

Dr. Sanford: We have not tried heated serum.

Dr. Furth: Dr. Sanford, to answer some of the problems raised, symmetrical systems are needed. The commercial horse sera come from adult or aged animals; calf and fetal calf sera are from another species, taken at diffrent ages. For basic comparison, it would be desirable to use sera of different species at various periods of life.

Dr. Sanford: Dr. Evans and Dr. Mitchell are exploring the effect of young and old, fetal and adult sera.

Dr. Furth: The old would be very interesting because there is ample evidence of transformation in old cells. They are innumerable and compatible with life.

Dr. K. G. Brand: Dr. Moore, did you ever extend your work to persons with diseases other than cancer, especially those with certain immune deficiencies? Also, could age be a factor, because your normal volunteers probably were young people in contrast to the older cancer patients?

Dr. A. E. Moore: The same type studies have been done on a group of debilitated volunteers who were in comparable condition to the patients with far-advanced cancer. They reacted more like the normal individuals. Regarding your second question about the age distribution, in the Ohio Penitentiary, many inmates come back repeatedly so that we did have quite a number of older individuals. Although I don't have the exact figures, I don't think age is a factor.

Dr. Furth: Did you say something about the immunological competence in age? Undoubtedly even the lymphocyte system deteriorates with age.

311–359—68——31

Digitized by Google

[HG00CA][GDrive]

Dr. Moore: This study was continued with Dr. Southam to study the immunological resistance developed to these transplants when the individual received repeated inoculations of the same type of tissue cultures. Other than that, I don't think a study has been done on the actual immunological competence.

Dr. Furth: And neoplasia?

Dr. Moore: The general feeling is that the individual with cancer develops more tumors and more progressively growing tumors than the normal individual.

Dr. Furth: How do cancer patients respond to a standard antigen at various stages of the disease compared to normal persons and persons with diseases other than cancer?

Dr. Moore: We know that cancer patients are perfectly capable of developing antibodies from previous virus studies. They develop them just as well as a normal individual.

Friday, October 10, 1969 Fremont News-Messenger 19

MORE THAN 125 members and guests of Northwest Ohio Public health association met Thursday in Holiday Inn north of Fremont for their annual convention. Among principals were from the left, Mrs. Frances Kiger, R.M., Toledo, retiring chairman; Dr. Alice Moore, the principal speaker from Sloan-Kettering Institute, New York City, and J. T. Pool, executive director of the Betty Jane Center at Tiffin. Dr. Moore's talk was about "Cancer: The Disease as We See It Today." Professionals and volunteers in public health are members of the association. The convention theme was "Frontiers of Health." (News-Messenger Photo)

SPEAKING OF YOUR HEALTH

Hopeful News In Medicine

By LESTER L. COLEMAN, M.D.

ALL OF US who have taken courses in first aid remember the instructions for use of the tourniquet to stop bleeding. I have for years warned that the tourniquet, when applied without real knowledge, can be more of a danger than an advantage.

It is true that a properly applied tourniquet around the limb can control hemorrhage. But it is also true that when the tourniquet is too tight or kept on for too long a period of time it can cut off the circulation and may be responsible for the loss of a limb.

Medical officers, now treating war casualties are instructed to control bleeding by pressure over the bleeding point rather than risk the danger of the tourniquet.

The results already show that by banning the tourniquet, fewer limbs have been sacrificed.

This may be a valuable lesson to those of us who offer first aid. Pressure can control bleeding in most instances. A heavy towel directly over the site is probably a great deal safer than the too heroic application of the tourniquet.

COLEMAN

Wonder of wonders! A new virus has been found that is loving, kind, gentle and friendly to human beings. Such is the possiblity espoused by a group of scientists who believe that some of these friendly viruses may yet be used for the treatment of certain types of cancers. At the present time this is only a hopeful idea but it is being pursued at the Sloan-Kettering Cancer Institute in New York City.

Dr. Alice E. Moore is trying to confirm the work of Dr. Hugh E. Webb at the St. Thomas Hospital in London. It is believed that this good or friendly virus does not produce disease in man and has a special capacity, in some way, to battle cancers.

The exact process by which the virus acts against cancers is still unknown. But it is suspected that it helps to build up some special immune defense against tumors.

It is always astonishing to learn about the many avenues that brilliant research takes in an effort to conquer these dread diseases.

"The Sea Around Us" is more than a continuing testimonial to Rachael Carson. It is an idea that must be studied so that underwater plants and fish life may be preserved.

A great deal of evidence is being accumulated about valuable drugs that can be extracted from sea water and the marine animals which inhabit it.

Students of marine technology are finding remarkable drugs which, when purified from the sea animals, can be used in the treatment and control of some diseases.

Already safe drugs that may be substituted for barbiturates and others that may be used for better control of epilepsy are being tried after they have been isolated from our marine friends.

Rachel Carson's plea that we keep these plants and animals alive by stopping water pollution may yet be a permanent testimonial to her vision.

SPEAKING OF YOUR HEALTH: Nursing homes for the elderly must become a gift of living rather than a threat to them.

These columns are designed to relieve your fears about health through a better understanding of your mind and body. All the hopeful new advances in medicine reported here are known to doctors everywhere.

Your individual medical problems should be handled by your own doctor. He knows you best.

The New York Times

SATURDAY, FEBRUARY 20, 1971

Dr. Frank L. Horsfall Jr. Dies; Sloan-Kettering Institute Head

Virologist, 64, Served as the Director of Unit for Cancer Research Since 1960

Dr. Frank L. Horsfall Jr., president and director of the Sloan-Kettering Institute for Cancer Research, died last evening at the institute, 410 East 68th Street. He was 64 years old. The cause of death was not disclosed.

Dr. Horsfall had directed the institute as chief executive officer since early in 1960. It is a research unit of the Memorial Sloan-Kettering Cancer Center, the largest medical center in the world for cancer research.

Dr. Horsfall, a prominent virologist, chemotherapist and a specialist in respiratory infections, had spent 26 years at the Rockefeller Institute for Medical Research in this city before he succeeded Dr. C. P. Rhoads as head of the Sloan-Kettering Institute.

Dr. Rhoads had directed the institute from its establishment in 1945 until his death in August, 1949. In the latter year Dr. Horsfall joined the institute's board of scientific consultants.

Dr. Frank L. Horsfall Jr.

Medical Sciences at Cornell University; director or research and trustee of Memorial Sloan-Kettering Cancer Center, and director of research at the Memiroal Hospital for Cancer and Allied Diseases.

He was a member of the National Academy of Sciences, the

[HN01K5][GDrive]

Dr. Frank L. Horsfall Jr., president and director of the Sloan - Kettering Institute for Cancer Research, died last eve ning at the institute, 410 East 68th Street. He was 64 years old. The cause of death was not disclosed.

Dr. Horsfall had directed the institute as chief executive officer since early in 1960. It is a research unit of the Memorial Sloan - Kettering Cancer Center, the largest medical center in the world for cancer research.

Dr. Horsfall, a prominent virologist, chemotherapist and a specialist in respiratory infections, had spent 26 years at the Rockefeller Institute for Medical Research in this city before he succeeded Dr. C. P. Rhoads as head of the Sloan Kettering Institute.

Dr. Rhoads had directed the institute from its establishment in 1945 until his death in August, 1949. In the latter year i Dr. Horsfall joined the institute's board of scientific consultants.

He was graduated from the University of Washington in 1927 and went on to McGill University, Montreal, where he received his M.D. in 1932.

Served Health Division

After serving his internship and residency periods at Peter Bent Brigham Hospital in Boston and Royal Victoria Hospital and Montreal General Hospital, both in Montreal, he joined the Rockefeller Institute in 1934.

He served as an assistant and assistant resident physician, then as resident physician, **until 1937, when he joined the Rockefeller Foundation as a staff member of the International Health Division.** He re turned to the institute in 1941 as a member and as physician to the hospital.

Dr. Horsfall served from 1942 to 1946 as a commander with the United States Naval Reserve. He was senior medical officer for the United States Naval Research Unit at the hospital of Rockefeller Institute in 1944–45.

In 1955 he was named vice president for clinical studies and physician in chief to the hospital and in 1957 he added the titles of member and professor.

From 1949 to 1953 he was a member of the board of Scientific Consultants at Sloan Kettering.

In an address at the University of Virginia in 1961, not long after he had taken the top post at the institute, he asserted that heredity can be changed and even directed, at least in the somewhat limited field of bacteria. He also stated that control of heredity in cells could be a key tool in prevent ing cancer.

The finding led to hope that tests could be devised to detect cancer - causing viruses before disease developed and even to work out immunization procedures to keep the viruses from entering the cells.

At his death Dr. Horsfall was a member and trustee of Sloan Kettering, professor of medi cine at Cornell University Medical College, director and professor of Microbiology at the Sloan - Kettering division of Medical Sciences at Cornell University; director or research and trustee of Memorial Sloan Kettering Cancer Center, and director of research at the Memorial Hospital for Cancer and Allied Diseases.

He was a member of the National Academy of Sciences, the American Philosophical Society, the Royal College of Physicians and Surgeons of Canada, the American Academy of Arts and Sciences and the Association of American Physicians as well as many other scientific societies and organizations.

He was president of the Harvey Society in 1956–57, vice president of the American Society for Clinical Investigation from 1934 to 1944, president of the American Association of Immunologists from 1967 to 1968 and president of the Practitioners' Society since 1969.

Dr. Horsfall was a consultant for and member of a number of private organizations and Government boards. He served on the committee on research - basic sciences and vaccine advisory committee of The National Foundation, New York, and on the Commission on Health Services of the City of New York.

He also was a member of the scientific advisory committee of the Institute for Cancer Re search, Philadelphia; the board of governors of the Weizmann Institute of Science, Rehovot, Israel; the management advisory council of the Oak Ridge National Laboratory, Oak Ridge, Tenn., and the U.S.A. National Committee of the International Union Against Cancer.

He was awarded honorary degrees from Uppsala University in Sweden in 1961 and the University of Alberta and Mc Gill university, both in 1963.

He received many scientific awards, including the Eli Lilly Award in Bacteriology and Immunology in 1937, the John F. Lewis Prize of the American Philosophical Society in 1959 and the Fiftieth Anniversary Gold Medal of Peter Bent Brig ham Hospital in 1963.

He leaves his wife, the for mer Norma E. Campagnari, who had been a registered nurse be fore their marriage on July 1, 1937.

He is survived also by three children, Frank L. 3d, Susan and Mary.

A funeral service will be held at Frank E. Campbell's, Madison Avenue and 81st Street, on Monday at 11:30 A.M.

Mrs. Chella Moore

BELLEVUE — Services were conducted this morning from the Immaculate Conception Church for Mrs. Chella Ann Moore, 92, formerly of 307 Castalia St. The Rev. Leo Lehmkuhl officiated and burial was in the parish cemetery.

Mrs. Moore died Monday at the Villa Maria Nursing Home in Green Springs. She had been a patient for five years.

A native of Ottawa County, she was born Aug. 9, 1882, to the late John and Sarah (Ransom) Snyder. She was a member of the Immaculate Conception Church, and was a charter member of the Alter-Rosary Society.

She is survived by a daughter, Dr. Alice Moore, Cornwall Bridge, Conn. She was the widow of John Moore, who died in 1937.

The family asks that memorials be given to the Villa Maria Nursing Home.

Father John Moore passed in 1937, as noted in this 1975 newspaper clip

Gustave Adolph Mueller (born 1863)

[HB000R][GDrive]

Born - Crestline, Ohio, Nov. 10, 1863,

"GUSTAVE A. MUELLER, M. D., of Pittsburg, Pa., a prominent physician and specialist on diseases of the ear, nose and throat." [HB000S][GDrive]. Gustave Adolph Mueller, M.D., is the father if Robert Swan Mueller I (b 1893).

1863 - Born

"GUSTAVE A. MUELLER, was born in Crestline, Ohio, Nov. 10, 1863, son of August C. E. Muel ler, a‘ native of Pomerania, Germany, who came to America in 1855 and located in Ohio, and of his wife, Elizabeth (Von Dorschlag) Mueller, also a native of the Fatherland. Dr. Mueller attended the third ward school of Allegheny city, and was graduated from the Sharpsburg academy. Later he attended the University of Michigan, and then matriculated at the Hahnemann medical college of Chicago, and was graduated from that well-known homoeopathic institution in 1885." [HB000S][GDrive] . Gustave Mueller was a graduate of university of Michigan 1884. [HE001J][GDrive]

1885 - 1894 - Early career

"Dr. Mueller began the general practice of medicine in Allegheny city soon after graduating [in 1885], and was there city physician from 1885 to 1894." [HB000S][GDrive]

1891 - Marriage

"Dr. Mueller was married, in 1891, to Grace Swan, daughter of Wm. B. and Grace (Swan) Miller, her mother having been the daughter of Robert Swan, one of the oldest citizens of Allegheny city, and an uncle of Mrs. Mueller's was postmaster of Allegheny city for several years. " [HB000S][GDrive]

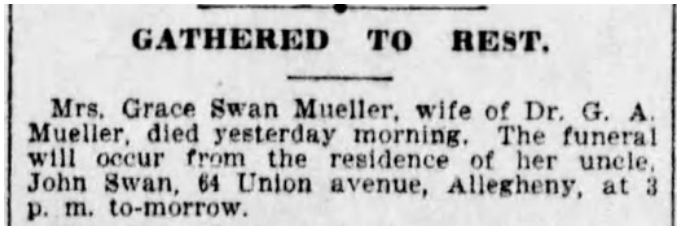
1894 - 1896 - Study in Europe

"During the latter year he sailed for Europe to study the nose, ear and throat, attended postgraduate courses in Berlin, Heidelberg, Munich, Vienna, Paris and Lon don, and spent two years abroad perfecting himself in his specialty.

Return travel - Note that from the passenger list, we can see that Gustav Mueller had his wife and son traveling with him. (See [HJ0006][GDrive])

1897 - Death of wife Grace Swan (Miller) Mueller

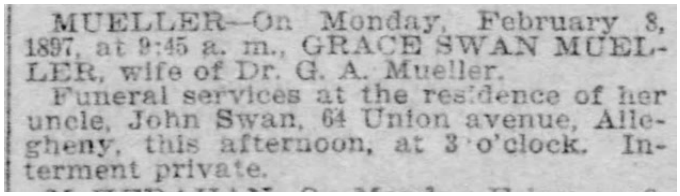
Grave Swan Mueller passed at an early age of 29 (or 30) in the year 1897 ([HL0018][GDrive]). Son Robert Swan Mueller I would have been about 4 years old. (See full pages of newspapers at [HN00L6][GDrive] and [HN00G1][GDrive]).



GATHERED TO REST.

Mrs. Grace Swan Mueller, wife of Dr. G. A. Mueller, died yesterday morning. The funeral will occur from the residence of her uncle, John Swan, 64 Union avenue, Allegheny, at 3 p. m. to-morrow.

[HN00L7][GDrive]



MUELLER—On Monday, February 8, 1897, at 9:45 a. m., GRACE SWAN MUELLER, wife of Dr. G. A. Mueller.
Funeral services at the residence of her uncle, John Swan, 64 Union avenue, Allegheny, this afternoon, at 3 o'clock. Interment private.

[HN00G2][GDrive]

1897-1904 - Career / Groups

Following source : [HB000S][GDrive]

Note - the fact that the bio ends at 1904, is what we use to frame in this timeline.

"Since [his travel to Europe] he has practiced in Pittsburg, confining his practice to the nose, ear and throat, and for a time had offices at No. 400 Penn Ave., but in 1900 removed to the Empire building, where he now enjoys one of the best practices in Pittsburg. He isa member of the staff of surgeons of the homoeopathic hospital, and has charge of the ear, nose and throat work in that institution. He has been three times appointed a member of the State board of medical examiners, is a member of the faculty of the Pittsburg training school for nurses, member and ex-president of the Allegheny county homoeopathic medical society, member of the East End doctors' club, the Pennsylvania State homoeopathic medical society, the American institute of homoeopathy, and the American homoeopathic, ophthalmological, otological and laryngological society. Dr. Mueller is also a member of the Masonic fraternity and the Odd Fellows, having held all offices in the local lodge of the latter order, served as representative to the grand lodge, and medical director of the Odd Fellows' endowment association. He was one of the incorporators of the Bank of secured savings of Allegheny city, and is a member of the University, Duquesne, Monongahela, Pittsburg country, Highland golf and other clubs; the Sportsmen's association of Cheat mountain, and of the alumni of Hahnemann medical college."

1900 - Remarried to Nell (Anderson) Mueller

Dr. Gustave A. Mueller married his second wife, **Nell Anderson (Miller) Mueller**, before the year 1900 [HB000S][GDrive] .

"Dr. Mueller was again married, in 1900, and on this occasion to Nell W., daughter of H. C. and Louise (Worthington) Anderson, of Steubenville, Ohio, and their wedded life has been an ideal one."

1900

A clip from the 1900 USA Census from Allegheny, Pennsylvania is shown below. It was taken on June 7 in 1900. (Full page from census, here : [HS000D][GDrive]). This Census shows Gustave A Mueller, born in November 1864 in Oho (age 35 at the time of this 1900 Census); his occupation is identified as a "physician". His wife in 1900 was Nell Mueller (his second wife), born in September of 1872. The Mueller household had one resident servant as of the 1900 census, named **Mary Campbell** (age 21).

The 711 Arch Street in Allegheny, Pennsylvania that was described as an address no longer exists, according to Google maps (Jan 2019). A National Aviary is there now.

1912 (Feb) - Death

The ***"The Journal of the American Institute of Homeopathy, Volume 4, Issues 4-9"*** (available in digital form on Google here : [HP000Q][GDrive]) describes Dr. Gustave Mueller as having fallen to typhoid fever (page 1205):

Gustave A. Mueller, M. D., Hahnemann Medical College, Chicago, 1885; died at the Homœopathic Hospital, Pittsburgh, Pa., February 12, from typhoid fever, aged 48.

[HP000Q][GDrive]

Full page source of below article : [HN00L4][GDrive]

Gustave A. Mueller

Dr. Gustave A. Mueller, aged 48, of H street, Oakmont, one of the best known physicians of the homeopathic school in Pittsburgh, died yesterday morning of typhoid fever in the Homeopathic Hospital. Dr. Mueller was born in Crestline, O., and moved to Pittsburgh when a boy. He attended the Sharpsburg Academy and later the University of Michigan. In 1885 he graduated from the Hahnemann Medical College of Chicago, Ill., and began to practice in Allegheny. He was soon afterward appointed city physician, of Allegheny which position he held until 1884, when he went to Europe to study. There he took degrees in the universities of Berlin, Heidelberg, Munich, Vienna, Paris and London.

Dr. Mueller was a staff surgeon at the Homeopathic Hospital, and had been recently appointed to serve his fifth term as a member of the state medical board.

Dr. Mueller was one of the incorporators of the Bank of Secured Savings of Allegheny. He was married in 1891 to Miss Grace Miller, of the North Side, who died in 1896. In 1900 he married Miss Neil W. Anderson of Steubenville, O., who survives with two sons, Robert and Gustave A. Mueller. He also leaves five sisters, Mrs. Annie Mueller and Miss Clara Mueller of the North Side, Mrs. Moses Calhoun of Green Arbor, Mrs. N. L. Becker and Mrs. Emma Des Jardiens of Chicago.

Funeral from his late residence, Oakmont, Pa. Services at Trinity Episcopal Church, Sixth avenue, Monday afternoon at 2:30 o'clock. Interment private in Highwood Cemetery. Remains may be viewed at church from 2 o'clock until hour of service.

Mrs. Calhoun and daughter, Miss Clara were called to the stricken home today.

Virginia Boyce Lind

Only living child of William Dickson Boyce (1858 - 1929) .

Obituary for Virginia Boyce Lind (Aged 95)

V. Lind, Boy Scouts founder's kin, dies

Virginia Boyce Lind of Palm Beach died Saturday, Aug. 5, 2006, in Palm Beach. She was 95.

Mrs. Lind was the only living child of William Dixon Boyce, founder of the Boy Scouts of America. She was a graduate of Miss Porter's School in Farmington, Conn., and a member of the First Families of Virginia Society. During World War II, she served in the Women's Motor Corps. She was a member of The Episcopal Church of Bethesda-by-the-Sea and the Bath & Tennis Club as well as the Bathing Corp. of Southampton, N.Y., the Colony Club of New York and the Greenwich Field Club.

Mrs. Lind was preceded in death by her husband, Albert Lind of Palm Beach and Hobe Sound, and her youngest son, William Boyce Mueller.

She is survived by two sons, Oliver James Sterling Jr. and Lee Worthington Mueller, and two grandchildren, Oliver James Sterling III and Vanessa Ruth Lancaster Sterling.

She will be buried at Congressional Cemetery in Washington, D.C.

Quattlebaum Funeral Home, 1200 S. Olive Ave., West Palm Beach, handled arrangements.

Robert Swan Mueller I (b1893)

[HN00FA][GDrive]

Robert Swan Mueller I (also known as **Robert Swan Mueller Sr.**) was born on April 9, 1893, in Allegheny City, Pennsylvania .

Parents : **Robert Swan Mueller I** was the son of Gustave Adolph(us) Mueller M.D. and **Grace Swan (Miller) Mueller**.

Robert Swan Mueller I (Referred to here sometimes as *"RSM1"*) is the father of Robert Swan Mueller II and John Freeman Mueller . He is also the grandfather of Robert Swan Mueller III, the man leading the "Russia 2016 election interference special council" in the United States.

EARLY YEARS

1893 (April 9) - Born

Robert Swan Mueller I was born on April 9, 1893 to Gustave Adolph(us) Mueller M.D. and **Grace Swan (Miller) Mueller**.

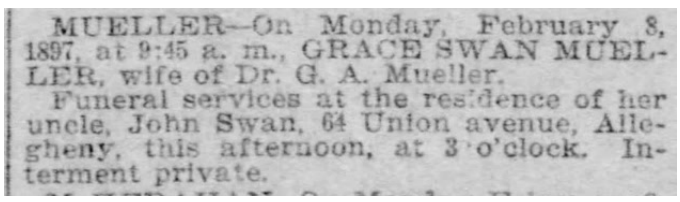
1894 - 1896 - Infant years in Europe, as father traveled for study

As an infant, a young Robert Swan Mueller I traveled with his parents to Europe for about two years, a time where his father studied *"the nose, ear and throat, attended postgraduate courses in Berlin, Heidelberg, Munich, Vienna, Paris and London, and spent two years abroad perfecting himself in his specialty."*

Return travel - Note that from the passenger list, we can see that Gustav Adolph(us) Mueller M.D. had his wife and son traveling with him. (See [HJ0006] [GDrive])

1897 - Death of Grace Swan (Miller) Mueller (Robert Swan Mueller I's mother)

Robert Swan Mueller I's mother passed at an early age of 29 (or 30) in the year 1897 [HL0018][GDrive]. Robert Swan Mueller I would have been about 4 years old. (See full page in newspaper at [HN00G1][GDrive]).



MUELLER—On Monday, February 8, 1897, at 9:45 a. m., GRACE SWAN MUELLER, wife of Dr. G. A. Mueller.
Funeral services at the residence of her uncle, John Swan, 64 Union avenue, Allegheny, this afternoon, at 3 o'clock. Interment private.

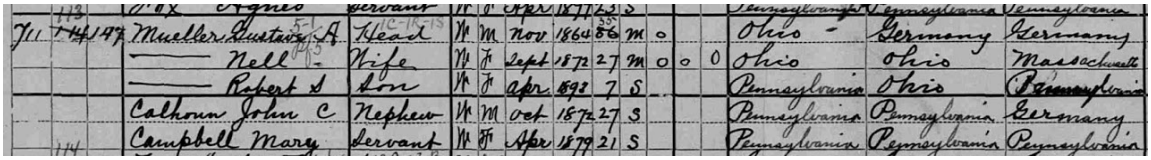
[HN00G2][GDrive]

1900 - Stepmother Nell (Anderson) Mueller

Robert's father, **Dr. Gustave A. Mueller**, married is second wife, **Nell Anderson (Miller) Mueller**, before the year 1900. [HB000S][GDrive]

1900

A clip from the 1900 USA Census from Allegheny, Pennsylvania is shown below. It was taken on June 7 in 1900. (Full page from census see [HS000D][GDrive]). This Census shows Gustave Adolph Mueller (b1863) (father) as a "physician, stepmother **Nell Mueller** (his second wife), and **Robert Swan Mueller I**. The Mueller household had one resident servant as of the 1900 census, named **Mary Campbell** (age 21). The 711 Arch Street in Allegheny, Pennsylvania no longer exists on a year-2019 Google map. A National Aviary is there now (2019).



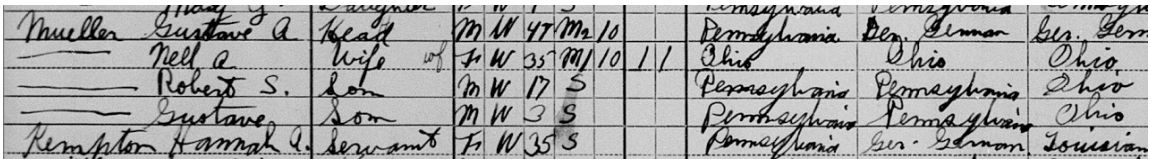
[HS000E][GDrive]

1904 - Attended Pittsburgh Public schools

"[...] Robert Swan Mueller, born in 1893, and now a pupil of the public schools of Pittsburg. " [HB000S][GDrive]

1910

The 1910 Census: In 1910, the Mueller family (with Dr Gustav Mueller as the head of the family, now age 47) moved to 🌐 **Oakmont, Pennsylvania** , which is a borough in Allegheny County in the Pennsylvania, but remaining in the Pittsburgh metro area. Dr. Gustav Mueller now identifies his profession as "surgeon". (Full census sheet at [HS000B][GDrive]). **Robert Swan Mueller I** is still living at home, now age 17. The new family member **Gustave Mueller (Jr.)** is only 3 years old as of the 1910 census. Their address of **"110/111 H-Street" in Oakmont** cannot be found on a year-2019 Google map.



[HS000C][GDrive]

1911-1915 - Lafayette College

Starting 1911 Robert Swan Mueller I attended **Lafayette College**. In the Allentown Democrat (Oct 14 1915), in the wedding description for Robert Swan Mueller I, it says that Mueller completed 4 years of college and graduated in 1915. (For this reference, see the clipping here: [HN00DN][GDrive]).

Robert Swan Mueller I is identified in the 1912 Lafayette College yearbook, and was identified as a prospective 1915 graduate of Lafayette. (A link to the full PDF of the book for ***"Biographical catalogue of Lafayette college, 1832-1912"*** is here : [HE000E][GDrive]). 1911-1912 was his freshman year.

[HE000F][GDrive]

1912 - Death of Gustave Mueller (Robert Swan Mueller I's father)

Gustave Adolph(us) Mueller M.D., who Robert Swan Mueller' Is father, passed at the early age of 48 years on February 9, 1912. He passed away from typhoid fever at age 48. At the age of only 19, Robert Swan Mueller I has now lost both of his biological parents. His stepmother Nell Mueller and young half-brother Gustav Mueller are still alive.

The ***"The Journal of the American Institute of Homeopathy, Volume 4, Issues 4-9"*** (available at [HP000O][GDrive]) describes Dr. Gustave Mueller as having fallen to typhoid fever (page 1205):

Gustave A. Mueller, M. D., Hahnemann Medical College, Chicago, 1885; died at the Homœopathic Hospital, Pittsburgh, Pa., February 12, from typhoid fever, aged 48.

[HP000Q][GDrive]

1915 (Feb) - Wedding attendance for Law-Babst

(See full newspaper page at [HN00EA][GDrive])

If Robert Swan Mueller I was graduating from Lafayette in 2015, then his graduation would have been 2-3 months after this wedding, hence not yet employed.

Some information on the guests - *"Her father, Chester Babst, was president of the Charles Babst Company, which sold physician supplies. Chester died in 1925, at the age of 38"* (http://www.karensbranches.com/Memoir/BarbaraBabstFord.html)

The Law-Babst Wedding Party

An Event of Last Evening in Shadyside

Back row, left to right—Stanley O. Law, Paul C. Harper, Chester Rowland Babst, Marshall Kiehl, Robert Dickey and Robert Mueller. Front row, left to right—Miss Laura Elkin, Mrs. Clifford C. Wilkins, Mrs. Chester Rowland Babst, Miss Marie Laughner and Miss Nan Freeman.

[HN00EB][GDrive]

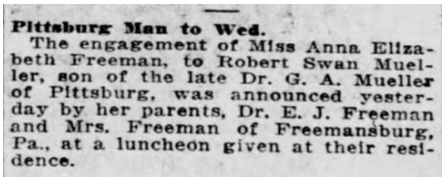
QUAINTLY frocked and not unlike the old-fashioned girl of the '70s were the bridesmaids at the wedding of Miss Katharine Overholt Law and Chester Roland Babst at 8 o'clock last evening in the Shady Avenue Baptist Church. The Rev. James E. Norcross, pastor of the church, performed the ceremony in the presence of a large assemblage. The bride, who was given away by her father, Carl Clayton Law, wore a beautiful gown of white French lace having a full court train, cut square, of Eltesse satin. Her tulle veil was fastened to a cap of rose pointe lace and coronet of orange blossoms, and she carried a bouquet of white roses and valley lilies centered with forget-me-nots. Her only ornament was the bridegroom's gift, an exquisite diamond and sapphire bar pin. The matron of honor, Mrs. Clifford C. Wilkins, wore her wedding gown of white satin and real lace and carried an armful of white sweet peas and Richmond roses, caught with green tulle. The three bridesmaids, Miss Marie Laughner, Miss Nan Freeman of Freemansburg, Pa., and Miss Laura Elkins of Indiana, Pa., appeared in white taffeta empire frocks with full skirts and carried large colonial bouquets of Richmond roses. An Oliver Twist suit of black velvet was worn by the little page, Nox McCain Kehew, son of Mr. and Mrs. Everett Kehew of Emerson street. Paul C. Harper was Mr. Babst's best man, and completing the bridal party were the ushers, Stanley O. Law, a brother of the bride and a student at Cornell University; Marshall Kiehl, who returned from Princeton for the wedding, Robert Dickey and Robert Mueller. A reception and wedding dinner supplemented the church service, the bride's parents and Mrs. Charles Babst of Fairmount avenue, mother of the bridegroom, receiving with the bridal party. Mrs. Law was attired in turquoise blue velvet and Mrs. Babst wore black Chantilly lace.

The bridal table held an artistic

[HN00ED][GDrive]

1915 (April) - Engagement to Anna Elizabeth Freeman

The engagement of **Miss Anna Elizabeth Freeman** to Robert Swan Mueller was announced in the Pittsburgh Press newspaper on April 8, 1915. Robert Swan Mueller I would have been about 22 years old at the time of his engagement/wedding to Anna. **Anna Elizabeth Freeman** was born in 1892 [HL001A] [GDrive]. The bride's parents were including **DR. Edward Jacob Freeman (born 1851)** (of Freemansburgh, Pennsylvania), means both the bride and groom (father was **Dr. Gustave Adolph Mueller**) had parents who were doctors. (See full newspaper page at [HN00EE][GDrive] , with clip shown below.



Pittsburg Man to Wed.

The engagement of Miss Anna Elizabeth Freeman, to Robert Swan Mueller, son of the late Dr. G. A. Mueller of Pittsburg, was announced yesterday by her parents, Dr. E. J. Freeman and Mrs. Freeman of Freemansburg, Pa., at a luncheon given at their residence.

[HN00EF][GDrive]

Is Miss Anna Elizabeth Freeman in the Bethlehem Steel family? We believe so.

John Knecht married **Eliza Reigel** on Feb 2, 1841 Their 4th daughter was **Emily J Knecht**,

Emily J Knecht married **Dr. Edward Jacob Freeman (b Dec 18, 1851)** . Dr E J Freeman and Emily J (Knecht) Freeman had 4 children; Only one lived to be an adult - **Anna ("Nan") Elizabeth Freeman** ,

Who is John Knecht ? "With keen business foresight, Mr. Knecht saw the great benefit the Valley might realize from the building of the railroad, and after its completion he inaugurated the movement that resulted in the formation of the Bethlehem Iron Company."

Hypothesis - The family of Robert Swan Mueller I's bride "Anna Freeman" included the unspoken founders of Bethlehem Steel . That would explain the connections to US Shipping Board. And the move to Baltimore. And the sudden jolt into all the "high society" headlines, and ability to live in nicer homes.

1915 (estimated around summertime) - Joins National Metal Moldings Co. in Pittsburgh

Learn more about National Metal Moldings Corporation in Pittsburgh - **National Metal Moldings Corporation** .

1915 (Oct) - Wedding to Anna Elizabeth Freeman

The wedding was hosted at the home of Anna Freeman's parents (**DR. Edward Jacob Freeman**) in Freemansburgh, Pennsylvania. The best man for the wedding of Robert Swan Mueller I was **Frank M. Everson** of Pittsburgh. At the time of the wedding, Robert Swan Mueller I was with **The National Metal Company** at Pittsburgh. (See full page from Allentown Democrat newspaper at [HN00DM][GDrive]).

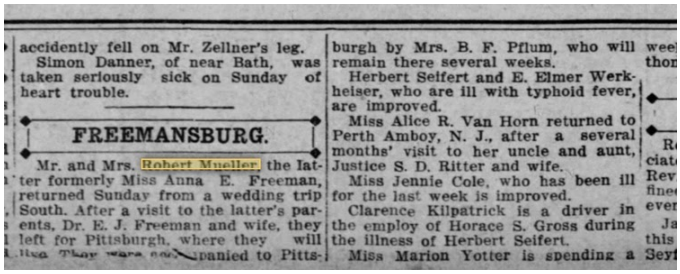
PRETTY HOME WEDDING AT FREEMANSBURG

A pretty home wedding was solemnized on Tuesday evening at the home of Dr. and Mrs. Edward J. Freeman at Freemansburg, when their daughter, Miss Anna E. Freeman, was married to Robert S. Mueller, of Pittsburgh. Rev. R. F. Reed, pastor of Trinity Reformed church, of Freemansburg, performed the ceremony. The couple were attended by Miss Ethel Bradely, of New York, who was maid of honor, and Miss Dorothy Mortimore, of Philadelphia. The best man was Frank M. Everson, of Pittsburgh.

The Freeman home and the grounds were beautifully decorated for the occasion. After the ceremony a wedding supper was served. Mr. Mueller is a graduate of Lafayette College, class of 1915, and is now identified with the National Metal Company at Pittsburgh.

[HN00DN][GDrive]

Robert Swan Mueller I stayed in Freemansburgh with his new bride and in-laws for a couple of weeks before returning home. (See full page - [HN00FS] [GDrive])



accidently fell on Mr. Zellner's leg.
Simon Danner, of near Bath, was taken seriously sick on Sunday of heart trouble.

FREEMANSBURG.

Mr. and Mrs. Robert Mueller, the latter formerly Miss Anna E. Freeman, returned Sunday from a wedding trip South. After a visit to the latter's parents, Dr. E. J. Freeman and wife, they left for Pittsburgh, where they will

burgh by Mrs. B. F. Pflum, who will remain there several weeks.
Herbert Seifert and E. Elmer Werkheiser, who are ill with typhoid fever, are improved.
Miss Alice R. Van Horn returned to Perth Amboy, N. J., after a several months' visit to her uncle and aunt, Justice S. D. Ritter and wife.
Miss Jennie Cole, who has been ill for the last week is improved.
Clarence Kilpatrick is a driver in the employ of Horace S. Gross during the illness of Herbert Seifert.
Miss Marion Yotter is spending a

The address of Robert Swan Mueller I is listed as "6757 Thomas" in Pittsburgh Pennsylvania, starting with 1916. His father passed a few years prior in 1912, so this home was not inherited from his family. It is a rather large home (still standing today, great neighborhood) for a man is 24 years of age. Presumably, the wealth from his wife's family afforded the young Mueller family to move to this location within a year of his graduation from Lafayette.

Barker, Jr., the latter of Uniontown will be ushers.

The ceremony will be solemnized in the Church of the Ascension at 8 o'clock, with the rector, Rev. Wyatt Brown, reading the service, and a reception will follow in the home of the bride's parents in Fifth ave.

[HN00EL][GDrive]

1917 - Military Enlistment

Robert Swan Mueller enrolled for the US military Draft Registration. His Registration date was in 1917. His address as of 1917 was 6757 Thomas, in Pittsburgh Pennsylvania (we know he moved there in late 1915 or early 1916). His height is described as "tall". A the time he was working at *"Natt Metal Molding Co."*, which we believe means **National Metal Molding Corporation**. The writing on the line of "present trade" is not legible.

1920

The 1920 Census: In 1920, the Mueller family has now separated. The new family, with Robert Swan Mueller I now 27 years old and the head of household with wife Anna, has moved their family in 1918 o Baltimore Maryland ("Newland Ave."). They now have two children - **Robert Swan Mueller II** (who is still referred to as Robert Swan Mueller Jr. in 1920), who is 3 years and 7 months old as of this 1920 census, and **John F. Mueller** (who we believe is **John Freeman Mueller (born 1919)** (**t**aking his grandmother's maiden name "Freeman" as his middle name), who is less than 1 year old. (See full census page form at [HS0008][GDrive]).

Robert Swan Mueller I is now identifying his career as *"Purchasing Agent"* on the 1920 census. History researcher John O'Loughlin comments on Twitter "From the 1920 Census, Robert Swan Mueller I lists his employment, as a Purchasing Agent [...] for the **United States Shipping Board** !" Information on the USSB can be found here : [🔵**United States Shipping Board**]. We do not know when Robert Swan Mueller I joined the USSB, but it must have been between mid 1917, but before mid 1920.

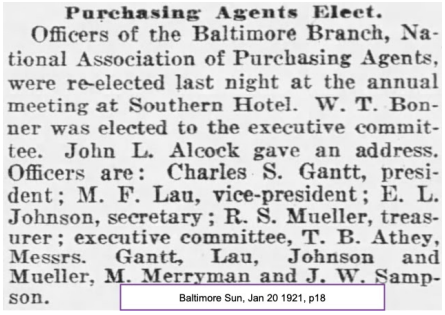
1921 (Jan) - Baltimore Branch of National Association of Purchasing Agent - Elected treasurer

On Jan 20 1921, the **Officers of the Baltimore Branch, National Association of Purchasing Agents** ... R.S. Mueller elected to be treasurer , and is on the executive committee. (See the full page in the Baltimore Sun at [HN00FG][GDrive])



Purchasing Agents Elect.

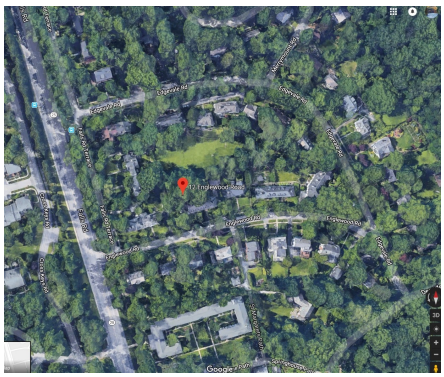
Officers of the Baltimore Branch, National Association of Purchasing Agents, were re-elected last night at the annual meeting at Southern Hotel. W. T. Bonner was elected to the executive committee. John L. Alcock gave an address. Officers are: Charles S. Gantt, president; M. F. Lau, vice-president; E. L. Johnson, secretary; R. S. Mueller, treasurer; executive committee, T. B. Athey, Messrs. Gantt, Lau, Johnson and Mueller, M. Merryman and J. W. Sampson.

Baltimore Sun, Jan 20 1921, p18

[HN00FH][GDrive]

1921 - Move to 12 Englewood Rd. in Baltimore

Based on the Baltimore phone directory, the Mueller family moved to the residence at 12 Englewood Rd in Baltimore between 1920 and 1921. The new Mueller family address is a duplex of a very high-end neighborhood of Baltimore. This is Google Street View today (Jan 2019) of that spot on Englewood Road in Baltimore. Robert Swan Mueller estimated his home value to be about 20,000 USD on the 1930 census (shown later), a time when the average US home price was under 5,000 USD. Combined with several children, and one servant to pay salary for, the 28-year-old Robert Swan Mueller I is apparently doing well financially as of 1921.



1922 (Feb) - Representing "Union Shipbuilding Co." in Baltimore at Local Association of Purchasing Agents

"R.S. Mueller" is described as the **Treasurer of the Union Shipbuilding Company in Baltimore**. See full Feb issue of "The Purchasing Agent" with all 1922 issues at [HP000R][GDrive].

THE PURCHASING AGENT
OFFICIAL ORGAN OF THE NATIONAL ASSOCIATION OF PURCHASING AGENTS

Vol. X NEW YORK, N. Y., FEBRUARY, 1921 No. 2

Government Method of Purchasing Supplies

By E. J. AYERS*

FOR many years prior to 1908, each of the executive departments and independent establishments of the Federal government made its own contracts for supplies for its own use, with little or no regard for uniformity. The contracts were let by calls and made selections from the samples best suited to the needs of the service. This system had grown until seventy-five different branches of the government, located in the District of Columbia, were each acting independently of the other and no effort had been made to consolidate the various interests by standardizing the articles in common use.

On June 11, 1908, a Board of Awards was established by executive order. This Board of Awards appointed a Supply Committee composed of a representative from each department and independent establishment. That committee, acting independently of the departments, accomplished the first steps toward standardization. They prepared a common schedule of supplies, giving each article a comprehensive heading description and placing all of the articles in groups of similar commodities. It was believed that this would result in an improvement in administrative methods over the prevailing methods of contracting for and purchasing supplies, which meant that the government in Washington had as many contracts for a given article as there were departments and independent establishments, including many bureaus. This schedule was approved by the Board of Awards on December 7, 1909.

The first attempt made by the House Appropriations Committee to enact legislation which would carry out the recommendations made to the President, November 14, 1910, by the Keep Commission on the Purchase of Supplies, failed, it was alleged, largely because of the fact that some of the departments feared the control and purchase of their supplies by some other department — that is, they objected to departmental instead of interdepartmental control.

On November 15, 1910, the Board of Awards addressed the heads of the various executive departments as to appointing delegates to compose a General Supply Committee, which was organized on January 12, 1909, and made a continuing body by Executive Order No. 1071, of May 11, 1909, and on June 17 of the following year the President approved the act creating the General Supply Committee, consisting of one representative from each department, appointed by the head thereof, whose duties were common to all.

LOCAL ASSOCIATION MEETINGS

BALTIMORE, MD. — The annual meeting of the Purchasing Agents' Association of Baltimore was held on January 19th. Election of officers was reported, with the following results: President, C. S. Gantt, of Baltimore Copper Smelting & Rolling Co.; Vice-President, M. F. Lau, of Davison Chemical Co.; Secretary, E. L. Johnson, of Black & Decker Mfg. Co.; Treasurer, R. S. Mueller, of Union Shipbuilding Co. National Directors: C. S. Gantt, of Baltimore Copper Smelting & Rolling Co.; C. C. Bartlett, of Poole Engineering & Machine Co. Local Executive Committee: T. B. Athey, of Bartlett-Hayward Co.; Mr. Merryman, of Mt. Vernon-Woodberry Mills; J. M. Bonner, of Western Electric Co. The resolution

[HP000U][GDrive]

Some info on hulls associated with Union Shipbuilding can be found here : [HW001G][GDrive]

"Union Shipbuilding Company was established in 1916 by the Riter-Conley Manufacturing Co. of Pittsburgh, a large industrial steel fabricator: the site was in the Fairfield section of Baltimore, on the west side of the harbor, where in 1913 Ellicott Machine Corp. had opened a yard to build dredge hulls. Riter-Conley's President, Thomas Riter, died in 1916, however, and the business was sold to McClintic-Marshall Co., who retained ownership until WWII, when it was acquired by the US government and became part of the Bethlehem Fairfield Shipyard."

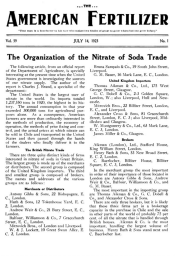
1923 (March) - "R. S. Mueller Company" opens in Baltimore

The following information was obtained from the 1935 issues of the periodical ***"The American Fertilizer"***. (You can download a copy of all of the volume 59 July-Dec 1923 issues in this PDF at [HP000X][GDrive]). A few pages at the front of the July 14, 1923 issue are below:

...THE...
AMERICAN FERTILIZER

JULY 14, 1923

THE PHOSPHATE MINING CO.



AMERICAN FERTILIZER

JULY 14, 1923

The Organization of the Nitrate of Soda Trade

See the January thru June 1923 issues here : [HP000V][GDrive]. We see that in **March of 1923** (on page 23 of "The American Fertilizer"), **Robert Swan Mueller I** of Baltimore opened up his company **"R. S. Mueller Company"** in Baltimore. This solidifies out knowledge that as of March 1923, Robert Swan Mueller I was no longer with the United States Shipping Board, but now owned and operated his own business as a "Chemical broker", with an apparent focus on the fertilizer industry. The person associated with the new business, **W. Whiteley Baker Jr.** , is an important individual to research. (See his page here : **William Whiteley Baker Jr. (b1894)**). The R.S Mueller Company was initially located in the **Vickers Building, Baltimore** .

NEW BALTIMORE BROKERS

R. S. Mueller has opened an office at 206 Vickers Building, Baltimore, Md. This new concern will specialize in all kinds of fertilizer materials, chemicals and oils. W. Whiteley Baker, Jr., is associated with Mr. Mueller.

[HP000Y][GDrive]

The **R.S. Mueller Company** has several specialties including (but not limited to) Chemical brokering, Chemicals, Fertilizer materials, Fish scrap, and sulfuric acid. The following are all taken from the July 14, 1923 issue.

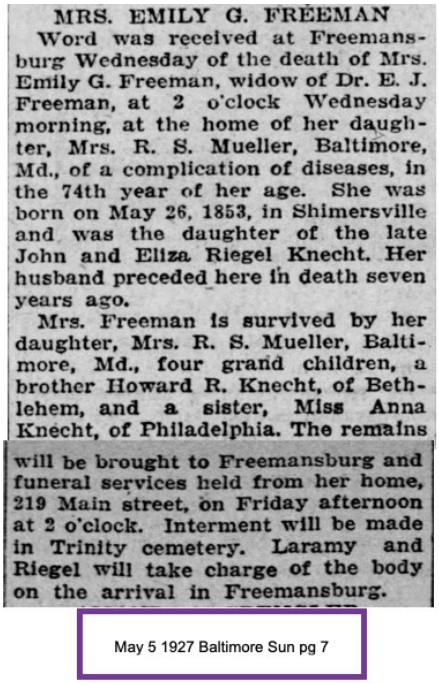
1927 (May) - Passing of Emily G Freeman (Mother in-law)

(See full page in 1927 newspaper at [HN00EG][GDrive]). Verification that **Emily Grace Freeman** was the wife of **Dr. Edward Jacob Freeman** , and she was the daughter of **John Knecht** and **Eliza (Riegel) Knecht**.



MRS. EMILY G. FREEMAN

Word was received at Freemansburg Wednesday of the death of Mrs. Emily G. Freeman, widow of Dr. E. J. Freeman, at 2 o'clock Wednesday morning, at the home of her daughter, Mrs. R. S. Mueller, Baltimore, Md., of a complication of diseases, in the 74th year of her age. She was born on May 26, 1853, in Shimersville and was the daughter of the late John and Eliza Riegel Knecht. Her husband preceded here in death seven years ago.

Mrs. Freeman is survived by her daughter, Mrs. R. S. Mueller, Baltimore, Md., four grand children, a brother Howard R. Knecht, of Bethlehem, and a sister, Miss Anna Knecht, of Philadelphia. The remains will be brought to Freemansburg and funeral services held from her home, 219 Main street, on Friday afternoon at 2 o'clock. Interment will be made in Trinity cemetery. Laramy and Riegel will take charge of the body on the arrival in Freemansburg.

1930 Census

The 1930 Census: In 1930, the Robert Swan Mueller I family in Baltimore, Maryland has grown and appears to be thriving. Robert Swan Mueller I is now 37 years old, and he and his wife Anna are now blessed to have four children, and one servant. **Robert Swan Mueller II** is the oldest son (who is Robert Swan Mueller Jr. as of 1920), who is 13 years of age, and his younger brother **John Freeman Mueller** is now 10 years old. The new children are daughters **Emilie G. Mueller** (age 9, born in 1921) and Elizabeth Mueller (age 7, born in 1923). In 1930, the Mueller household still employs one servant (now **Maurine Scott**, a female from Virginia who is 21 years of age).

The occupation of Robert Swan Mueller I on the 1930 Census is now listed as a "*Broker in the Banking industry*". We know that he opened his own company **"R.S. Mueller Company"** in March 1923, so it is assumed he is still with that job (as we see he identifies that as his place of work in his 1942 military enlistment.

1934 - Son Robert Swan Mueller II finishes high school / Travels to Europe for summer

Son **Robert Swan Mueller II** finished high school (**Gilman School** , in Baltimore Maryland) in 1934, and was prepared to begin college studies at **Princeton** in fall of 1934. In the summer of 1934, Robert Swan Mueller II traveled to Europe, returning on the **S.S. Clairton** on July 31 in 1934. The address on this passenger form helps identify that the family of Robert Swan Mueller I was still residing at 12 Englewood Road in Baltimore as of July in 1934. (See the full passenger sheet here: [HJ0003][GDrive].

1935 (July) - Fundraiser at Gibson Island / Mr and Mrs. Robert Mueller present

Full page : [HN00FB][GDrive]

1935 JULY - "I ST. CHRISTOPHER'S FETE TO BE HELD TUESDAY AFFAIR WILL OPEN WITH CHILDREN'S GYMKHANA AND WILL INCLUDE LUNCHEON, CARD PARTY AND DINNER DANCE IN ANNE ARUNDEL COUNTY"

The real beginning of the season at Gibson Island, the summer resort that is peculiarly our own. opened up with great eclat on July 4, and now the members of the island community are working whole-heartedly toward the success of a fete for the benefit of the little church, St. Christopher's-by-the-Sea,. which will be held Tuesday at the clubhouse.

The affair will begin at 10 A. M, with a children's gymkhana, under the chairmanship of Mrs. Merrill Stout, Mrs. James S. Sloan is co-chairman, Mrs. Sherman Trowbridge, Mrs. J. Herbert Bagg and Mrs. George Burgess are in charge of the paper chase and Mrs. Charles Peckham is in charge of the ice-cream cones. Miss Cynthia Williamson is taking care of the balloons, while her sister, Miss Jean Williamson, will manage the children's races. Miss Anne Palmer will direct the musical chairs; Mrs. H. W. Smith is chairman of the merry-go-round and Miss Carol Johnson of the ponies for the children.

Luncheon And Card Party

*Luncheon will be served at the club from 12 to 2, after which the card party, directed by **Mrs. Robert Mueller**, will start and be carried on until 4.30, when prizes will be distributed and refreshments served. Many reservations have been made, including that of Mrs. E. B. Freeman who will give a large luncheon and entertain five tables of bridge.*

Mrs. John Voneiff and Mrs. Charles Scarlett, Jr., have charge of the candy and will be assisted by Miss Joan Whitehead and Miss Jacqueline Karr. At 2.30 the toy boat races will be held under the direction of Mrs. Frederick C. Lee. Prizes will be awarded to the winners.

*Mrs. George Englar is chairman of the dinner dance committee, consisting of Mrs. Duane Rice, Mrs. Walter Hughson, Mrs. Francis Key Murray, Mrs. Emory Niles, Mrs. Blanchard Randall, Jr., Miss Cynthia Williamson, Miss Jean Williamson, Miss Nancy Wolfe and Miss Betty Novak. Reservations for tables seating from two to ten people have been made by Mr. and Mrs. Corrin Strong, Mr. and Mrs. Frank Russell, Mrs. Charles J. Sloan, Mi-, and Mrs. Paul Patterson, Mr. and Mrs. Sifford Pearre, Mr. and Mrs. Blanchard Randall, Jr., Mr. and Mrs. Francis E. Shriner, **Mr. and Mrs. Mueller** and Doctor and Mrs. Page Edmunds.*

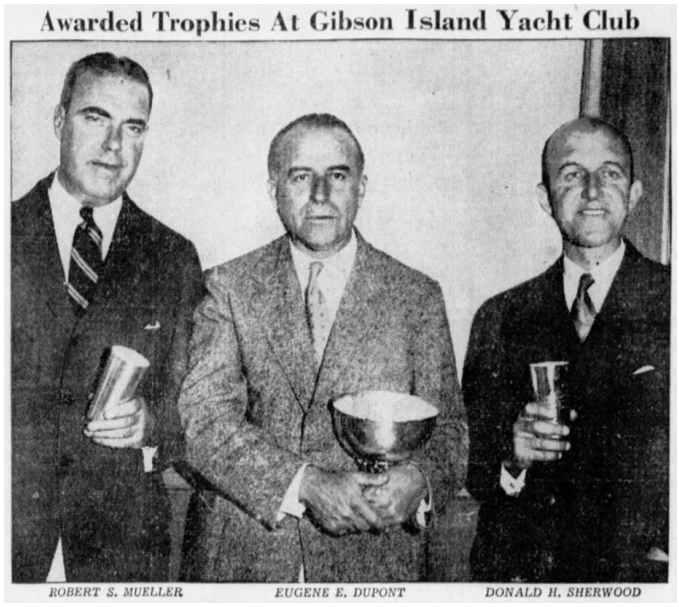
(See full page in 1935 newspaper at [HN00F6][GDrive]). This is **Robert Swan Mueller I** (on left) with his September 1935 winning trophy for the **Gibson Island** Yacht Club Race, standing next to Eugene E. du Pont (See **Eugene Éleuthère du Pont (born 1882)**).



[HN00F7][GDrive]

YACHT RACING PRIZES GIVEN

Skippers In Cedar Point Event Toast Craft At Gibson Island Club

Relaxing after the 100-mile cruising race to Cedar Point and back, skippers and crews of two dozen sailing craft toasted their boats last night at a banquet in the Gibson Island Club while prizes were awarded.

"Post mortems" of how one boat got jammed into the lee of the Eastern Shore, of how another crew sat becalmed and watched the rest of the fleet sail by were held, but soon were forgotten in the pleasures of the banquet board.

Plenty To Talk About

Prizes were not awarded on what might have happened. Skippers who shoved their boats first across the finish line off Baltimore Light got the awards. At that, there was plenty of excuse for talk, as no less than a half-dozen boats were in sight when the first one finished. And that, after a hundred miles of stick and rag, is something.

The boats set sail from Gibson Island Saturday morning and about 6.15 P. M. yesterday Mrs. D. C. Elphinstone's Rangoon, an eight-meter racing sloop, crossed the line first to win the Whiting trophy.

The Whiting trophy is awarded to the first boat to finish, regardless of class or time allowance. Mrs. Elphinstone sailed her own boat.

R. S. Mueller Wins Prize

The trophy in the racing division went to Robert S. Mueller, who put his Quest across the line in a good sailing breeze, which he had managed to carry most of the way.

The L. Corrin Strong cruising cup was won by Eugene E. du Pont, of Wilmington, Del., who brought his High Tide across the finish line a scant ten minutes ahead of J. Leo Flanigan's Gleam, which apparently had victory on its clean-swept decks only to watch, first place fade away when it ran into a calm within sight of the finish line.

However, the cruising division was divided into classes A and B. While the High Tide won Class A, the winner of Class B was the Sea Witch, owned and sailed by Donald H. Sherwood.

Bobby Miller Wins Trophy

As the long-distance racers were preparing for the evening's ceremonies the star boats went out to Baltimore Light and had a race of their own for the Symington Memorial trophy.

Ten stars slithered over a six-mile windward and leeward course in a close contest which was won by Bobby Miller in his Kingfish. After being in the ruck at the start, Miller took advantage of every slant of wind to nose out his brother, Berkeley T. R. (Bucky) Miller, who finished second in the Sole.

Others In Race

Others in the first division of the stars were Marjorie Hugson, in the Grayling, third; Aubrey Pearre, Jr., in the Bluefish, fourth, and Edmund Novak, in the Shark, fifth.

Others who were well up in the Cedar Point race were: Richard H. Randall, in the Loke, who finished third in the racing division; Theodore J. Hoster, in the Salabar, second in Class B of the cruising division; W. L. Henderson, in the Kelpie, third in the same class, and L. M. Balliere, in the Aweigh, third in Class A, behind the High Tide and the Gleam.

Amethyst Leads All Way To Win Final Of Whiting Trophy Yacht Series

FINISH FORCES TIE FOR PRIZE

Victory Places Sherwood Boat Even With Ariel At Gibson Island

Rangoon And Sunny In Deadlock For Second. Sail-Off In Doubt

By PETER C. CHAMBLISS

The Amethyst, leading all the way, finished well ahead of the fleet of eight yachts to win the final race of the George A. Whiting Trophy series for the racing class sailed yesterday off Mountain Ear under the auspices of the Gibson Island Yacht Squadron.

The final race of the series left the winner of the trophy very much in doubt. The Amethyst, sailed by John R. Sherwood, and the Ariel, owned by Donald H. Sherwood and sailed in yesterday's race by Corrin H. Strong, in the absence of the owner who is in Europe, are tied for first place.

Two other eight-meters—the Rangoon, sailed by Mrs. George Blakiston, and the Sunny, George A. Whiting, donor of the trophy—are tied for second place.

Sail-Off In Doubt

The manner in which the tie is to be broken is as much in doubt as the actual winner of the series. Whether the winner will be decided by the flip of a coin or whether there will be a sail-off between the leading boats or another race to pick the victor will be decided at a future meeting of the racing committee of which Phillip W. Howard is chairman.

Both the Amethyst and Ariel have 18 points and the Rangoon and Sunny have 16.

The Ariel, the former Priscilla II, and rated as the fastest 8-meter sloop in the country, went into the final race of the series with a perfect score, having won the first and second races. Her score for the first two races was 16. The Amethyst was standing third in the series at the beginning of the third race with a point score of 10. The score was tied at 18 when the Amethyst went over the line a winner and the Ariel dropped far behind, finishing in seventh place.

Competing Yachts

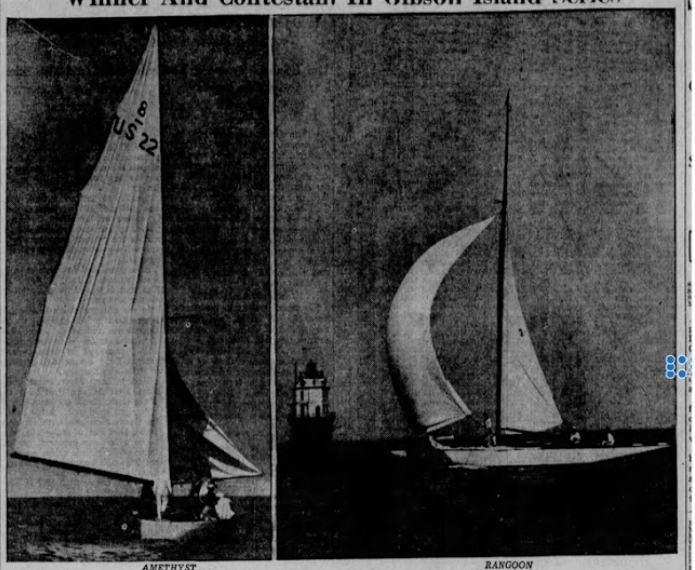
The competing yachts, their owners and point scores in the series are as follows:

Yacht.	Owner.	Point Score.
Amethyst,	John R. Sherwood	18
Ariel,	Donald H. Sherwood	18
Rangoon,	Mrs. George Blakiston	16
Sunny,	George A. Whiting	16
Loke,	Richard H. Randall	14
Valkyrie,	Phillip W. Howard	10
Quest,	Robert S. Mueller	9
Doble II,	C. Bon Mitchell, Jr.	7

Yesterday was an ideal day for sail yacht racing. Heading into the freshening southeast breeze, the Doble II, the Mitchell sloop, was first over the line, but in the extreme leeward position. Toward the other end of the line the Amethyst, the Mirage, the Larchmont sloop, owned by A. Karl Fischer, which started in the race, but was not actually racing, and the Loke went over well bunched.

The others were soon over and on their way, the majority of the yachts standing well over toward the Eastern Shore on their run down the Bay to Tolley Point Buoy, the windward mark which they were to round and return to the starting line. The Amethyst stepped right out and carried a nice lead around the windward mark. She apparently had little difficulty in maintaining the position on the return to the finish line.

Winner And Contestant In Gibson Island Series



AMETHYST RANGOON

Amethyst, 8-meter sloop, sailed by John R. Sherwood, is shown just after she crossed the finishing line yesterday winning the final race of the George A. Whiting series. She is tied with Ariel for first place in the series. Rangoon, sailed by Mrs. George Blakiston, was snapped just before she crossed the finish line between the committee boat and Baltimore Light. Rangoon is tied for second place with the Sunn, owned by George A. Whiting.

Sunny Second Boat

She finished the 16-mile course in 2 hours 55 minutes and 30 seconds, a minute and seven seconds ahead of the Sunny, the second boat to cross the finish line. The Loke, the Randall eight-meter, was third to finish, crossing in 2 hours, 58 minutes and 17 seconds.

That the race committee may establish some definite rule with regard to the participation of yachts in races that are not actually sailing in the race is probable after yesterday's contest during which the presence of the Mirage caused no little confusion.

Both the Mirage and the Lone Star, owned by John Markel, sailed in the race last Sunday and both started yesterday, though at the meeting of the race committee following the race they were ruled out as non-contestants. It so happened that the Mirage finished ahead of the Ariel and had she been an actual contestant the point score would thus have been changed, giving the Amethyst the lead by one point.

Hagerty's Boat Leads Model Yacht Series

In the contest between Harold T. Smith and William Hagerty for first honors in the series of races being held under the auspices of the Baltimore Model Yacht Club at the Wash Water Lake at Montebello, Hagerty took the lead yesterday afternoon by 1 point.

The previous Sunday ended with Smith and Hagerty tied with 11 points each. When the races closed yesterday Hagerty had accumulated 18 points for the series of three and Smith had 17. Hagerty's yacht is the V. M. H. 11 and Smith's boat is Smokeless.

In order of their standing yesterday the other contestants were: Walter Bacon, Oreole, 11 points; Theodore G. Schulte, Atlanta, 11; J. R. Thomas, Tameriane, 10; Jan Butler, Catherine E. 9; John H. Coles, V. M. H. 3, and Oscar B. Perkins, My Maryland, tied with 4 points; J. M. Blake, Jan, Jr., 2, and Carl Dinkelman, Margaret Ann, 1.

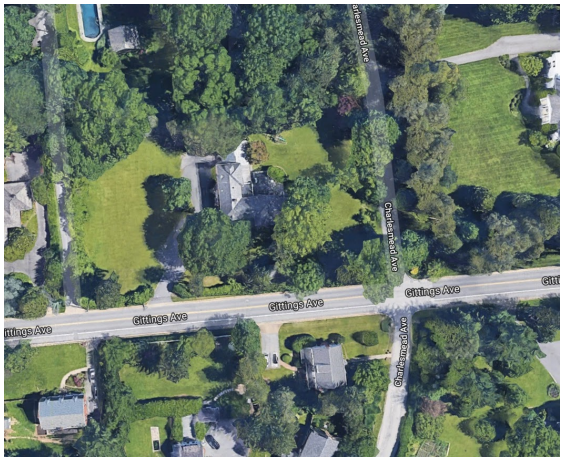
1935 to 1939 - Mueller family moves to 6 Gittings Ave. in Baltimore

On the 1940 Census (shown later), we see that the Mueller's Baltimore home address has changes since the summer of 1934, to 6 Gittings Ave. in Baltimore, Maryland (a truly prestigious home).

6 Gittings Ave. in Baltimore is a true estate property. Robert Swan Mueller I was well compensated for his work.



1937 - Fundraiser for chapel on Gibson Island (Mrs. Robert Mueller present?)

(Source : [HN00FY][GDrive])

1937 PARTY - "ANNUAL SUMMER CARNIVAL FOR THE BENEFIT OF THE PROTESTANT EPISCOPAL CHAPEL. ST. CHRISTOPHER'S-BY-THE- SEA, THE GIBSON ISLAND. MD."

Personal and Social : *For a number of years past, residents of Westminster have attended the annual summer carnival for the benefit of the Protestant Episcopal Chapel. St. Christopher's-by-the- Sea, the Gibson Island. Md., invitation having come from Mrs. H. A. Foothorap. Harrisburg. Pa., and Gibson Island. The 1937 event is under the chairmanship of Mrs. Sifford Pearre, who wras formerly Miss Angela Young, a cousin of Mrs. Henry M. Fitzhugh. Mr. Pearre is a first cousin of J. Pearre Wantz Taneytown 1and a member of the well-known Pearre family of Frederick County. Another member of the committee arranging this event is Mrs. George Monroe Englar. who was formerly Miss Bettie Walker. Mount Airy. Mr. Englar is a son of ex-Senator and Mrs. George P. B. Englar. New Windsor. Others well known here helping with the affair are Mrs. W. Buckey Clemson,* ***Mrs. Robert Mueller*** *and Mrs. James Sloan.*

Mrs. Edwin Waters was a recent guest of Mrs. Foothorap at her Gibson Island Home. Mrs. Waters has joined her husband, Captain Waters, U S. A., at Plattsburg. N. Y., where he has been stationed for several years. Captain and Mrs. Waters will soon leave for Idaho. Captain Waters having been detailed for duty in the R O. T. C. of the University of Idaho. Captain and Mrs. Waters were very popular here while Captain Waters was on the faculty of Western Maryland College Military Department. Their son, Edwin Waters. Jr., a member of the class of 1937 of Western Marvland College, has received an appointment as second lieutenant and has reported for duty at Fort Ontario, Oswego. [....]

1937 (June) - More yacht racing

Maryland And Gibson Island Yacht Clubs Hold Major Racing Events

SAILING MEN HAVE BUSY DAY

Snipe And Star Class Boats Hold Initial Races Of 1937

Fresh Breeze Heels Craft Over As Season Gets Under Way

By PETER C. CHAMBLISS

The interests of nearby yachtsmen were divided yesterday between the Maryland Yacht Club and Gibson Island, both of which had major events on their programs.

At the Maryland Yacht Club a twenty-one-mile race for cruising sailing yachts with the racing class participating as a separate unit over the same course from Ferry Bar to Swan Point to Rock Creek and a contest for the snipe class from the Maryland Yacht Club to the Sparrows Point Yacht Club closed the two-day regatta marking the opening of the club's yachting season.
